

Braukmann

V5007

Kombi-PICV

Pressure Independent Balancing and Control Valve

Application

The V5007 is a Pressure Independent Control Valve (PICV). It combines a flow controller and a full stroke, full authority temperature controller in one valve.

Equipped with an actuator Kombi-PICV provides a full stroke modulating temperature control.

It is suitable for use in variable and constant flow systems.

They may be used as constant flow limiter in constant flow systems (without an actuator) or as a Pressure Independent Control Valve in variable flow systems.

V5007 is typically used for balancing and temperature control of fan coil units, chilled ceilings and one-pipe heating systems. It is not intended for a potable water control.

Special Features

- Automatic balancing of differential pressure
 - Precise pressure independent flow performance
 - Highest energy saving potential due to efficient energy transfer and minimised pump speed
 - Measuring possibility to find the optimal setpoint for the pump
 - Versions with or without measuring connections available
 - Reduced movements of actuators as pressure fluctuation do not influence the required temperature
 - No complex calculation needed for selection
 - No balancing method needed for commissioning
 - Equal-percentage characteristics when used with modulating actuator
- Wide range of application
 - Sizes DN15 to DN50 cover all popular sizes on Fan Coil Units various versions to support standard flow rates as well as low flow and high flow needs
 - Covers hydronic balancing and temperature control in one valve thus reducing mounting costs
- Easy commissioning
 - Presetting with visual flow scale indicating directly the preset cubic meters per hour
 - Presetting using standard tool (wrench)
 - Can balance a system even if only some parts of a building are in operation
- Maintenance friendly
 - Emergency shut-off function with plastic cap – not for permanent use, maximum 6 bars one side overpressure

V5007T(Z/N)10

V5007T(Z/N)20

V5007T(Z/N)10(32/40/50)

- Draining and cleaning by opening of diaphragm area
- Flow measuring possibility for problematic applications (only with versions having measuring connections)
- Dirt resistant – no dead zones in the valves. Continuous flow assures self-cleaning effects. Ability to flush the diaphragm area

Technical Data

Media	
Medium:	Water with max. 50 % glycol according to VDI 2035 (up to 50 % Glycol)
pH-value:	8 - 9.5
Pressure values	
Max. operating pressure:	max. 25 bar for V5007T(Z/N)10... max. 16 bar for V5007T(Z/N)20... variants
Differential pressure range:	see table "K _V -values for measurement" 600 kPa (6 bar)
Δ _{pmin}	
Δ _{pmax}	
Operating temperatures	
Max. operating temperature medium:	-10 to 120 °C (14 - 248 °F) ¹

Connections/Sizes	
Nominal size:	DN15 - DN50
Specifications	
Flow values:	see table "K _v -values for measurement"
Leakage:	According to Class IV IEC 60534-4 (up to 6 bar differential pressure)
k _{vs} (c _{vs})-value:	see table "K _v -values for measurement"
Pressure accuracy:	+/- 10 % of actual preset value in ideal conditions for presetting higher than 20 % of maximum

1. In case of usage above 90 °C discuss the application with customer care.
In the event of sub-zero temperatures and/or condensation, we recommend installing insulation shells (see Accessories, page 8).

Construction

V5007T(Z/N)10... variants

Overview	Components	Materials
	1 Hexagon for presetting the valve. Easy presetting by standard tool (SW19)	High performance polymer
	2 Valve housing for internal and external threads (V5007TZ... variant) and internal threads (V5007TN... variant)	Dezincification-resistant brass
	3 Metallic cover with draining connection secured by nut allows PN25	Dezincification-resistant brass
	4 Two SafeCon™ pressure test valves for measuring using venturi effect	Dezincification-resistant brass
Not depicted components:		
Valve insert with diaphragm assembly		High resistant polymer with EPDM diaphragm and stainless steel components
Sealings		EPDM
Presetting parts		High resistant polymer and brass
Inner parts		Brass, stainless steel, high resistant polymer and EPDM
Installation and setup instructions		Paper

Method of Operation

The V5007 combines the functionality of a dynamic balancing valve and a control valve in one product.

The dynamic balancing function maintains a constant differential pressure over the control valve.

The control valve regulates the flow by means of a variable orifice which is controlled by the actuator (with the equal percentage characteristics of the control).

The constant differential pressure across the control valve ensures accurate control and full valve authority, independent of the pressure conditions in the system.

To adjust the maximum flow setting:

- 1) disengage actuator by removing actuator from valve or loosening the actuator nut while securing actuator
- 2) turn the hexagon to required flow setting
- 3) remount the actuator

Measurement

The V5007TN10... and V5007TZ10... variant of the valve enables two type measurement using pressure test valves. These measuring ports gets its pressure on the inner orifice, which is only dependent on the presetting of the valve and thus not changing with the differential pressure regulated on the valve. One of the ports (+) is in front of the orifice, one is behind the inner orifice on the outlet of the valve. The measurement available is following:

Flow measurement

For the flow measurement the differential pressure measurement and the k_v -value correspondent to the presetting of the valve is necessary. The valve plug has to be in fully open position (i.e. the actuator has to be fully opened or not installed on the valve). K_v values are dependent on the position of the measurement points and the measurement may be influenced by the actual turbulence and flow conditions. The precision of the measurement may be affected. The differential pressure can be obtained by measurement on the pressure test valves according to the following schematics:

Flow rate can be calculated according to a following formula:

$$Q = kv \times \sqrt{\Delta p_Q}$$

Formula	Unit	Description
K_v	[l/h]	Coefficient obtained from following table (in accordance with actual presetting of the valve
Δp_Q	[bar]	Measured differential pressure

Fig. 1 Flow measurement

Differential pressure measurement

In case the overall differential pressure over the whole valve needs to be obtained, the additional accessory for measurement needs to be used which enables the pressure measurement in front of the valve (Measuring adapter with heat sink – see Item No. in the accessories section). The pressure measurement port on the accessory and  port on the valve (see Fig. 2) should be used for the measurement.

Fig. 2 Differential pressure measurement

Transportation and Storage

Keep parts in their original packaging and unpack them shortly before use.
The following parameters apply during transportation and storage:

Parameter	Value
Environment:	clean, dry and dust free
Min. ambient temperature:	5 °C
Max. ambient temperature:	60 °C
Min. ambient relative humidity:	5 % *
Max. ambient relative humidity:	90 % *

*non condensing
