## Legal information

### Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

#### **DANGER**

indicates that death or severe personal injury **will** result if proper precautions are not taken.

#### **WARNING**

indicates that death or severe personal injury **may** result if proper precautions are not taken.

#### **CAUTION**

indicates that minor personal injury can result if proper precautions are not taken.

#### **NOTICE**

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

### Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

### Proper use of Siemens products

Note the following:

#### **WARNING**

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

### Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

### Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

# Introduction

## 1.1 About SINUMERIK

From simple, standardized CNC machines to premium modular machine designs – the SINUMERIK CNCs offer the right solution for all machine concepts. Whether for individual parts or mass production, simple or complex workpieces – SINUMERIK is the highly dynamic automation solution, integrated for all areas of production. From prototype construction and tool design to mold making, all the way to large-scale series production.

Visit our website for more information SINUMERIK (<https://www.siemens.com/sinumerik>).

## 1.2 About this documentation

### Target group

This publication is intended for:

- Project engineers
- Commissioning engineers
- Machine operator
- Service and maintenance personnel

### Purpose

The Diagnostics Manual refers to the alarms / messages from the NC area, HMI, PLC and SINAMICS. It should be used as a reference manual and allows operators at the machine tool:

- To correctly assess special situations when operating the machine.
- To understand the response of the system to the special situation.
- To utilize the options for continued operation following the special situation.
- To follow references to other documentation containing further details.

### Benefits

The Diagnostics Manual enables the intended target group to evaluate error and fault indications and to respond accordingly.

With the help of the Diagnostics Manual, the target group has an overview of the various diagnostic options and diagnostic tools.

### Standard scope

This documentation only describes the functionality of the standard version. This may differ from the scope of the functionality of the system that is actually supplied. Please refer to the ordering documentation only for the functionality of the supplied drive system.

It may be possible to execute other functions in the system which are not described in this documentation. This does not, however, represent an obligation to supply such functions with a new control or when servicing.

For reasons of clarity, this documentation cannot include all of the detailed information on all product types. Further, this documentation cannot take into consideration every conceivable type of installation, operation and service/maintenance.

The machine manufacturer must document any additions or modifications they make to the product themselves.

**Websites of third-party companies**

This document may contain hyperlinks to third-party websites. Siemens is not responsible for and shall not be liable for these websites and their content. Siemens has no control over the information which appears on these websites and is not responsible for the content and information provided there. The user bears the risk for their use.

## 1.3 Documentation on the internet

### 1.3.1 Documentation overview SINUMERIK 828D

Comprehensive documentation about the functions provided in SINUMERIK 828D Version 4.8 SP4 and higher is provided in the 828D documentation overview (<https://support.industry.siemens.com/cs/ww/en/view/109766724>).

You can display documents or download them in PDF and HTML5 format.

The documentation is divided into the following categories:

- User: Operating
- User: Programming
- Manufacturer/Service: Configuring
- Manufacturer/Service: Commissioning
- Manufacturer/Service: Functions
- Manufacturer/Service: Safety Integrated
- SINUMERIK Integrate/MindApp
- Info & Training

### 1.3.2 Documentation overview SINUMERIK operator components

Comprehensive documentation about the SINUMERIK operator components is provided in the Documentation overview SINUMERIK operator components (<https://support.industry.siemens.com/cs/document/109783841/technische-dokumentation-zu-sinumerik-bedienkomponenten?dti=0&lc=en-WW>).

You can display documents or download them in PDF and HTML5 format.

The documentation is divided into the following categories:

- Operator Panels
- Machine control panels

- Machine Pushbutton Panel
- Handheld Unit/Mini handheld devices
- Further operator components

An overview of the most important documents, entries and links to SINUMERIK is provided at SINUMERIK Overview - Topic Page (<https://support.industry.siemens.com/cs/document/109766201/sinumerik-an-overview-of-the-most-important-documents-and-links?dti=0&lc=en-WW>).

## 1.4 Feedback on the technical documentation

If you have any questions, suggestions or corrections regarding the technical documentation which is published in the Siemens Industry Online Support, use the link "Send feedback" link which appears at the end of the entry.

## 1.5 mySupport documentation

With the "mySupport documentation" web-based system you can compile your own individual documentation based on Siemens content, and adapt it for your own machine documentation.

To start the application, click on the "My Documentation" tile on the mySupport homepage (<https://support.industry.siemens.com/cs/ww/en/my>):

The configured manual can be exported in RTF, PDF or XML format.

---

### Note

Siemens content that supports the mySupport documentation application can be identified by the presence of the "Configure" link.

---

## 1.6 Service and Support

### Product support

You can find more information about products on the internet:

Product support (<https://support.industry.siemens.com/cs/ww/en/>)

The following is provided at this address:

- Up-to-date product information (product announcements)
- FAQs (frequently asked questions)
- Manuals
- Downloads
- Newsletters with the latest information about your products
- Global forum for information and best practice sharing between users and specialists
- Local contact persons via our Contacts at Siemens database (→ "Contact")
- Information about field services, repairs, spare parts, and much more (→ "Field Service")

### Technical support

Country-specific telephone numbers for technical support are provided on the internet at address (<https://support.industry.siemens.com/cs/ww/en/sc/4868>) in the "Contact" area.

If you have any technical questions, please use the online form in the "Support Request" area.

### Training

You can find information on SITRAIN at the following address (<https://www.siemens.com/sitrain>).

SITRAIN offers training courses for automation and drives products, systems and solutions from Siemens.

### Siemens support on the go

With the award-winning "Siemens Industry Online Support" app, you can access more than 300,000 documents for Siemens Industry products – any time and from anywhere. The app can support you in areas including:

- Resolving problems when implementing a project
- Troubleshooting when faults develop
- Expanding a system or planning a new system

Furthermore, you have access to the Technical Forum and other articles from our experts:

- FAQs
- Application examples
- Manuals
- Certificates
- Product announcements and much more

The "Siemens Industry Online Support" app is available for Apple iOS and Android.

### **Data matrix code on the nameplate**

The data matrix code on the nameplate contains the specific device data. This code can be read with a smartphone and technical information about the device displayed via the "Industry Online Support" mobile app.

## 1.7 Important product information

### Using OpenSSL

This product can contain the following software:

- Software developed by the OpenSSL project for use in the OpenSSL toolkit
- Cryptographic software created by Eric Young.
- Software developed by Eric Young

You can find more information on the internet:

- OpenSSL (<https://www.openssl.org>)
- Cryptsoft (<https://www.cryptsoft.com>)

### Compliance with the General Data Protection Regulation

Siemens observes standard data protection principles, in particular the data minimization rules (privacy by design).

For this product, this means:

The product does not process or store any personal data, only technical function data (e.g. time stamps). If the user links this data with other data (e.g. shift plans) or if he/she stores person-related data on the same data medium (e.g. hard disk), thus personalizing this data, he/she must ensure compliance with the applicable data protection stipulations.

## Fundamental safety instructions

### 2.1 General safety instructions

#### **WARNING**

##### **Danger to life if the safety instructions and residual risks are not observed**

If the safety instructions and residual risks in the associated hardware documentation are not observed, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

#### **WARNING**

##### **Malfunctions of the machine as a result of incorrect or changed parameter settings**

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

## 2.2 Warranty and liability for application examples

Application examples are not binding and do not claim to be complete regarding configuration, equipment or any eventuality which may arise. Application examples do not represent specific customer solutions, but are only intended to provide support for typical tasks.

As the user you yourself are responsible for ensuring that the products described are operated correctly. Application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

## 2.3 Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit

<https://www.siemens.com/industrialsecurity> (<https://www.siemens.com/industrialsecurity>).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under

<https://www.siemens.com/industrialsecurity> (<https://new.siemens.com/global/en/products/services/cert.html#Subscriptions>).

Further information is provided on the Internet:

Industrial Security Configuration Manual (<https://support.industry.siemens.com/cs/ww/en/view/108862708>)

### WARNING

#### Unsafe operating states resulting from software manipulation

Software manipulations, e.g. viruses, Trojans, or worms, can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a holistic, state-of-the-art industrial security concept for the installation or machine.
- Make sure that you include all installed products into the holistic industrial security concept.
- Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.
- On completion of commissioning, check all security-related settings.

## Explanation of the alarms

### 3.1 Structure of alarm descriptions

#### Overview of alarms

You can find descriptions of the alarms in chapters:

- NC alarms (Page 25)
- Cycle alarms (Page 449)
- HMI alarms (Page 617)
- SINAMICS alarms (Page 627)
- I/O alarms (Page 1239)
- PLC alarms (Page 1251)

In each chapter, the alarm descriptions are sorted according to ascending alarm number. There are gaps in the sequence.

#### Structure of the SINUMERIK alarm descriptions

The descriptions of the alarms have the following layout:

---

**<Alarm No.>      <Alarm text>**

**Explanation:**

**Reaction:**

**Help:**

**Continue  
program:**

Each alarm is uniquely identified using the <Alarm number> and the <Alarm text>.

The description of the alarms is classified according to the following categories:

- Explanation
- Response  
See Chapter: System reactions to SINUMERIK alarms (Page 1259)
- Remedy  
See Chapter: Cancel criteria for alarms (Page 1261)
- Program continuation  
See Chapter: Cancel criteria for alarms (Page 1261)

**SINAMICS alarms**

The faults and states detected by the individual components of the drive system are flagged using alarms. These SINAMICS alarms are categorized into faults and alarms.

The differences between faults and alarms are as follows:

|              |                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fault</b> | <p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> <li>• The appropriate fault response is initiated.</li> <li>• Status signal ZSW1.3 is set.</li> <li>• The fault is entered in the fault buffer.</li> </ul> <p>How are faults resolved?</p> <ul style="list-style-type: none"> <li>• Remove the cause of the fault</li> <li>• Acknowledge the fault</li> </ul> |
| <b>Alarm</b> | <p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> <li>• Status signal ZSW1.7 is set.</li> <li>• The alarm is entered into the alarm buffer.</li> </ul> <p>How are alarms resolved?</p> <ul style="list-style-type: none"> <li>• Alarms acknowledge themselves. When the cause has been removed, the alarms reset themselves automatically.</li> </ul>          |

**Structure of SINAMICS alarm descriptions**

The descriptions of the SINAMICS alarms have the following layout:

---

**<Alarm No.>      <Location data>    <Alarm text>**

**Message value:**

**Drive object:**

**Reaction:**

**Acknowledgment:**

**Cause:**

**Help:**

Each alarm is uniquely identified using the <Alarm number> and the <Alarm text>.

The <Location data> is optional display information. Location data can include:

- Axis name and drive number  
OR
- Bus and slave number of the PROFINET or PROFIBUS DP component affected

The place holder <Location data> is kept in the alarm description for this optional information.

The description of the SINAMICS alarms is classified according to the following categories:

- **Message value**  
The information provided under the message value tells you about the composition of the fault/alarm value.  
Example:  
Message value: Component number: %1, cause: %2  
This fault value or alarm value contains information about the component number and cause. The entries %1 and %2 are place holders, which are filled appropriately in online operation with the commissioning software.
- **Drive object**  
For each alarm (fault/alarm) it is specified in which drive object this message can be found. A message can belong to either one, several or all drive objects.
- **Response**  
Specifies the default response in the event of a fault.
- **Acknowledgment**  
Specifies the default method of acknowledging the fault/alarm after the cause has been removed.
- **Cause**  
Describes the possible causes. For the cause of the alarm, the fault/alarm value is essentially prepared in text form.
- **Remedy**  
Describes the possible remedies.

A detailed description of the fault responses and acknowledgment can be found in Chapter: System reactions for SINAMICS alarms (Page 1262).

## References

You can find additional information about SINAMICS messages in the following manual:  
SINAMICS S120/S150 List Manual.

### Syntax:

The syntax of the parameter messages can be derived as follows:

In the diagnostic manual, the messages initiated by SINAMICS always start with a "2" followed by a 5-digit number.

In the SINAMICS S120/S150 List Manual, the messages begin with a letter, followed by a 5-digit number:

- "F" (Fault)
- "A" (Alarm)
- "N" (No Report)
- "C" (Safety message)

If you require further information on the alarms, you can find a description in the SINAMICS List Manual by replacing the first number "2" of the message number with the letter "F", "A", "N", or "C".

### 3.1 Structure of alarm descriptions

**Example:**

You can find a description of alarm **207016** in the SINAMICS S120/S150 List Manual under fault **F07016**.

You can find a description of alarm **201330** in the SINAMICS S120/S150 List Manual under fault **A01330**.

## Synchronization of time and date

---

**Note**

**Synchronization of time**

The SINAMICS drives have no real-time clock. The time of day and date of the SINAMICS clock are synchronized in a 10-second cycle with the SINUMERIK real-time clock.

The result is that after a change of the date and/or the clock of the SINUMERIK real-time clock up to 10 seconds collapses until these changes have been synchronized with the SINAMICS drives.

If in this up period of up to 10 seconds SINAMICS messages occur (number range 200000 - 299999), this SINAMICS messages still receive the outdated date/time stamp. The SINUMERIK alarms (alarm numbers < 200000 and > 300000) triggered as a result of the SINAMICS messages, on the other hand, already receive the new date/ time stamp.

---

## 3.2 Alarm number ranges

The following tables show an overview of all reserved number ranges for alarms/messages.

Table 3-1 System error

|                   |              |                                                                                                     |
|-------------------|--------------|-----------------------------------------------------------------------------------------------------|
| 001.000 - 001.199 | System error | The following alarms are system errors:<br>If a system error occurs, contact the Technical Support, |
|-------------------|--------------|-----------------------------------------------------------------------------------------------------|

Table 3-2 NC alarms/messages

|                   |                       |                                             |
|-------------------|-----------------------|---------------------------------------------|
| 000.000 - 009.999 | General alarms        |                                             |
| 010.000 - 019.999 | Channel alarms        |                                             |

| <b>Explanation:</b>           | With this alarm, internal alarm states are displayed that, in conjunction with the transferred error number, provide information on the cause and location of the error. Especially with parameter %3 (system error number) = 840001 = Problem with tool management, the identification for the axis is not contained in parameter %2, but instead, further information for the diagnostics (= Status of the data management/magazine no./location no./T no.) |

| <b>Explanation:</b> | The floating point unit of the processor has found a computational error.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Reaction:</b>    | NC not ready.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Alarm reaction delay is canceled.                                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>      | If you experience such a system error, please contact Technical Support.<br><a href="http://www.siemens.com/sinumerik/help">www.siemens.com/sinumerik/help</a><br>Please supply the following information to ensure quick processing: <ul style="list-style-type: none"><li>- Alarm number together with alarm text</li><li>- Description of the operation/mode before the alarm message</li><li>- Generate log files using the key combination: &lt;Ctrl&gt; + &lt;Alt&gt; + &lt;D&gt;</li></ul> |

**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

---

### 1019 [Channel %1: ] Floating point arithmetic error at address %3 task %2 FPU state %4

**Parameters:** %1 = Channel number  
 %2 = Task ID  
 %3 = Code address of operation that triggered the error  
 %4 = FPU status

**Explanation:** The floating point unit of the processor has triggered an exception on account of a computational error.

**Reaction:** NC not ready.  
 Mode group not ready, also effective for single axes.  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.  
 Alarm reaction delay is canceled.

**Remedy:** If you experience such a system error, please contact Technical Support.  
[www.siemens.com/sinumerik/help](http://www.siemens.com/sinumerik/help)  
 Please supply the following information to ensure quick processing:  
 - Alarm number together with alarm text  
 - Description of the operation/mode before the alarm message  
 - Generate log files using the key combination: <Ctrl> + <Alt> + <D>

**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

---

### 1020 [Channel %1: ] Floating-point arithmetic error in CC %2 addresses %3 task, FPU status %4

**Parameters:** %1 = Channel number  
 %2 = CC filename  
 %3 = Code address (absolute + incremental) of the operation causing the error  
 %4 = FPU status and task ID

**Explanation:** The floating-point unit of the processor has triggered an exception due to an arithmetic error.  
 The arithmetic error was made in a compile cycle.

**Reaction:** NC not ready.  
 Mode group not ready, also effective for single axes.  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.  
 Alarm reaction delay is canceled.

**Remedy:** If you experience such a system error, please contact Technical Support.  
[www.siemens.com/sinumerik/help](http://www.siemens.com/sinumerik/help)  
 Please supply the following information to ensure quick processing:  
 - Alarm number together with alarm text  
 - Description of the operation/mode before the alarm message  
 - Generate log files using the key combination: <Ctrl> + <Alt> + <D>

**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

---

### 1160 Assertion failed in %1: %2

**Parameters:** %1 = String (path with program name)  
 %2 = String (line number)

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | This alarm is purely a development alarm and will not appear in a delivered software version. For an OEM customer, this alarm could indicate that an alarm has occurred in the system software. Handling of the 'assertion' allows error conditions leading to this alarm to be defined in the system software during the development phase. After the development phase, this alarm output is no longer active. |
| <b>Reaction:</b>              | NC not ready.<br>The NC switches to follow-up mode.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Alarm reaction delay is canceled.                                                                                                                                                                                         |
| <b>Remedy:</b>                | Check the cause of the error in the specified software component at the specified line number.                                                                                                                                                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with the RESET key in all channels. Restart part program.                                                                                                                                                                                                                                                                                                                                            |

## 2000 PLC sign-of-life monitoring

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The PLC must give a sign of life within a defined period of time (MD10100 \$MN_PLC_CYCLIC_TIMEOUT). If this does not occur, the alarm is triggered.<br>The sign of life is a counter reading on the internal NC/PLC interface which the PLC causes to count up with the 10 ms time alarm. The NCK also tests cyclically whether the counter reading has changed.<br>The PLC must give a sign of life within a defined period of time. If this does not occur, this alarm is triggered.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Reaction:</b>              | NC not ready.<br>Local alarm reaction.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Check monitoring time frame in MD10100 \$MN_PLC_CYCLIC_TIMEOUT (reference value: 100 ms).<br>Establish the cause of the error in the PLC, and eliminate it (analysis of the ISTACK. If monitoring has responded with a loop in the user program rather than with a PLC Stop, there is no ISTACK entry).<br>This alarm is also caused by PLC stop.<br>(PLC stop with programming tool,<br>PLC stop by commissioning switch,<br>PLC stop by alarm)<br>If none of these cases applies, please contact Technical Support.<br><a href="http://www.siemens.com/sinumerik/help">www.siemens.com/sinumerik/help</a><br>Please supply the following information to ensure quick processing:<br>- Alarm number together with alarm text<br>- Description of the operation/mode before the alarm message<br>- Generate log files using the key combination: <Ctrl> + <Alt> + <D> |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 2110 NCK temperature alarm

|                               |                                                                               |
|-------------------------------|-------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The temperature sensor has reached the response threshold.                    |
| <b>Reaction:</b>              | Alarm display.                                                                |
| <b>Remedy:</b>                | In order to reset the sensor, the temperature must be reduced by 7 degrees C. |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                  |

---

## 2130 **Note: The standard password is still active for at least one of the access levels: manufacturer, service or user. %1**

|                               |                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Access level(s)                                                                                                                                                        |
| <b>Explanation:</b>           | For reasons of IT security do not use any standard passwords on the machine.<br>Please assign individual passwords to protect the machines from unauthorized modifications. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                              |
| <b>Remedy:</b>                | Change the password for the corresponding access level (-> "Setup area" -> "Password" -> "Change password").                                                                |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                |

---

## 2140 **The actual service switch position forces the SRAM to be cleared at the next Power On (general reset active)**

|                               |                                                                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The initialization switch is currently set to overall reset. This means that the module's SRAM is deleted with the next module reset. The NC data memory is cleared during this operation. |
| <b>Reaction:</b>              | NC not ready.<br>Interface signals are set.<br>Alarm display.                                                                                                                              |
| <b>Remedy:</b>                | Reset the initialization switch to zero.                                                                                                                                                   |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                     |

---

**2900 Reboot is delayed**

|                               |                                                                                                                                                                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | This alarm indicates a delayed reboot.<br>This alarm only occurs when reboot was carried out by the HMI and MD10088 \$MN_REBOOT_DELAY_TIME was set greater than zero.<br>The alarm can be suppressed with MD11410 \$MN_SUPPRESS_ALARM_MASK Bit 20.                              |
| <b>Reaction:</b>              | NC not ready.<br>The NC switches to follow-up mode.<br>Mode group not ready, also effective for single axes.<br>Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Alarm reaction delay is canceled. |
| <b>Remedy:</b>                | See MD10088 \$MN_REBOOT_DELAY_TIME and MD11410 \$MN_SUPPRESS_ALARM_MASK                                                                                                                                                                                                         |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                        |

---

**3000 Emergency stop**

|                               |                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The EMERGENCY STOP request is applied to the NCK/PLC interface DB2600 DBX0.1 (Emergency stop).                                                                                                                        |
| <b>Reaction:</b>              | NC not ready.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Alarm reaction delay is canceled. |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Remove the cause of the emergency stop and acknowledge the emergency stop via the PLC/NCK interface DB2600 DBX0.2 (emergency stop acknowledgment).         |
| <b>Programm continuation:</b> | Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                                                                                        |

---

**3001 Internal emergency stop**

|                               |                                                                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | This alarm is not displayed.                                                                                                                              |
| <b>Reaction:</b>              | NC not ready.<br>Local alarm reaction.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>NC Stop on alarm. |
| <b>Remedy:</b>                | No remedy required                                                                                                                                        |
| <b>Programm continuation:</b> | Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                            |

---

**4000 [Channel %1: ] Machine data %2[%3] has gap in axis assignment**

|                     |                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = String: MD identifier                                                                                                                                   |
| <b>Explanation:</b> | The assignment of a machine axis to a channel by the MD20070 \$MC_AXCONF_MACHAX_USED must be contiguous. At system power-up (Power On) gaps are detected and displayed as an alarm. |

|                               |                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | NC not ready.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                    |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. The entries for the indices for the machine axes used in the channels must be contiguous in table MD20070 \$MC_AXCONF_MACHAX_USED. Channel axis gaps must be enabled via MD11640\$MN_ENABLE_CHAN_AX_GAP. |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                            |

| <b>Explanation:</b>           | <p>For some applications, it is useful to operate an axis in several channels (C axis or spindle on single spindle or double carriage machines).</p> <p>The machine axes which are defined through the channel-specific MD20070 \$MC_AXCONF_MACHAX_USED in several channels, must be assigned to a master channel with the axis-specific MD30550 \$MA_AXCONF_ASSIGN_MASTER_CHAN.</p> <p>For axes that are activated in one channel only, the number of this channel or zero must be entered as a master channel.</p> |

| <b>Explanation:</b>           | MD20070 \$MC_AXCONF_MACHAX_USED defines which machine axes can be used in this channel. This also defines the number of active axes in the channel. This upper limit was exceeded. Note: The channel axis gaps may cause certain indices of MD20070 \$MC_AXCONF_MACHAX_USED to remain unused, and therefore do not count as active channel axes.<br>Example:<br>- CHANDATA(2)<br>- \$MC_AXCONF_MACHAX_USED[0] = 7<br>- \$MC_AXCONF_MACHAX_USED[1] = 8<br>- \$MC_AXCONF_MACHAX_USED[2] = 0<br>- \$MC_AXCONF_MACHAX_USED[3] = 3<br>- \$MC_AXCONF_MACHAX_USED[4] = 2<br>- \$MC_AXCONF_MACHAX_USED[5] = 0<br>- \$MC_AXCONF_MACHAX_USED[6] = 1<br>- \$MC_AXCONF_MACHAX_USED[7] = 0<br>This channel uses the five machine axes 1, 2, 3, 8, 7, i.e. it has 5 active channel axes. |

| <b>Parameters:</b>            | %1 = String: Name of identifier<br>%2 = String: MD identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | When determining a name in the NCK tables (arrays) for: machine axes, Euler angles, direction vectors, normal vectors, interpolation parameters and intermediate point coordinates, an identifier has been used that already exists in the control.                                                                                                                                                                                                                                                                                                      |
| <b>Reaction:</b>              | NC not ready.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                         |

**Remedy:** Please inform the authorized personnel/service department. Select for the identifier to be entered a character string that is not yet used in the system (max. 15 characters).

**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

---

**4021 [Channel %1: ] Identifier %2 used several times in machine data %3**

**Parameters:** %1 = Channel number  
%2 = String: Name of identifier  
%3 = String: MD identifier

**Explanation:** To determine the name in the channel-specific tables for geometry axes and channel axes an identifier already existing in the control has been used.

**Reaction:** NC not ready.  
Mode group not ready, also effective for single axes.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Please inform the authorized personnel/service department. Select for the identifier to be entered a character string that is not yet used in the system (max. 15 characters).

**Programm continuation:** Switch control OFF - ON.

---

**4030 [Channel %1: ] Identifier missing in machine data %2[%3]**

**Parameters:** %1 = Channel number  
%2 = String: MD identifier  
%3 = Index: MD array index

**Explanation:** An axis identifier is expected for the displayed MD in accordance with the axis configuration in the MD20070 \$MC\_AXCONF\_MACHAX\_USED and MD20050 \$MC\_AXCONF\_GEOAX\_ASSIGN\_TAB.

**Reaction:** NC not ready.  
Mode group not ready, also effective for single axes.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Please inform the authorized personnel/service department.  
Check axis configuration and enter the missing identifier into the MD or, should the axis not exist, specify for this channel axis the machine axis 0 in the channel-specific MD20070 \$MC\_AXCONF\_MACHAX\_USED. If this concerns a geometry axis that is not to be used (this applies only for 2-axis machining, e.g. on turning machines), then channel axis 0 must be entered additionally in the channel-specific MD20050 \$MC\_AXCONF\_GEOAX\_ASSIGN\_TAB.

**Programm continuation:** Switch control OFF - ON.

---

**4032 [Channel %1: ] Wrong identifier for facing axis in %2**

**Parameters:** %1 = Channel number  
%2 = String: MD identifier

**Explanation:** According to the axis configuration in MD20150 \$MC\_GCODE\_RESET\_VALUES or MD20100 \$MC\_DIAMETER\_AX\_DEF, a facing axis identifier is expected at the specified location.

**4059           Error during reading of system configuration (%1, %2)**

|                     |                                                              |
|---------------------|--------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = MD number<br>%2 = Error code                            |
| <b>Explanation:</b> | An error occurred while reading in and scaling machine data. |

|                               |                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | NC not ready.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm. |
| <b>Remedy:</b>                | - Please notify the authorized service personnel.                                                                                             |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                      |

---

#### 4060 **Standard machine data loaded (%1, %2, %3, %4)**

|                               |                                                                                                                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Identifier 1<br>%2 = Identifier 2<br>%3 = Identifier 3<br>%4 = Identifier 4                                                                                                                               |
| <b>Explanation:</b>           | The standard MD were loaded because<br>- a cold start was requested or<br>- the MD buffer voltage failed or<br>- an initialization was requested for loading the standard machine data (MD11200 \$MN_INIT_MD). |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                 |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. After automatically loading the standard MDs, the individual MDs must be entered or loaded in the relevant system.                                  |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                           |

---

#### 4062 **Backup data loaded**

|                               |                                                                               |
|-------------------------------|-------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The user data saved on the compact flash card have been loaded into the SRAM. |
| <b>Reaction:</b>              | Alarm display.                                                                |
| <b>Remedy:</b>                | Reload the specific machine data again.                                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                          |

---

#### 4065 **Buffered memory was restored from backup medium (potential loss of data!)**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The user data of the NC and the retentive data of the PLC are stored in a buffered memory area (SRAM). A possible inconsistency was detected in this buffered memory during ramp-up of the control.<br>The buffered memory was initialized with the last backup copy. Consequently, changes that have been made since the last update of the backup copy in the buffered memory have been lost.<br>A possible reason for a data inconsistency could be that the backup time was exceeded. Please note the required ON time of the control specified in your commissioning guide. |
| <b>Reaction:</b>              | NC not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Remedy:</b>                | Restart the control.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**4070 Normalizing machine data has been changed**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>The control uses internal physical units (mm, degrees, s, for paths, velocities, acceleration, etc.). During programming or data storage, some of these values are input and output using different units (rev./min, m/s<sup>2</sup>, etc.).</p> <p>The conversion is carried out with the scaling factors that can be entered (system-specific MD array MD10230 \$MN_SCALING_FACTORS_USER_DEF USER_DEF[n] (n ... index number 0 - 10), when the corresponding masking bit is set to "1".</p> <p>If the masking bit is set to "0", scaling takes place with the internal standard factors.</p> <p>The following machine data influence the scaling of other MDs:</p> <p>MD10220: \$MN_SCALING_USER_DEF_MASK<br/>MD10230: \$MN_SCALING_FACTORS_USER_DEF<br/>MD10240: \$MN_SCALING_SYSTEM_IS_METRIC<br/>MD10250: \$MN_SCALING_VALUE_INCH<br/>MD30300: \$MA_IS_ROT_AX</p> <p>If these data are modified, the NCK must be powered up again. Only then will the input of dependent data be performed correctly.</p> |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remedy:</b>                | <p>Please inform the authorized personnel/service department.</p> <p>If the alarm has been displayed after downloading an MD file which is consistent within itself, then the download operation must be repeated with a new NC power-up. (The file contains scaling-dependent machine data in front of the scaling factors).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**4071 Check the position of the encoder**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>A machine data has been changed that affects the value of an absolute encoder position. Please check the position values.</p> <p>For absolute encoders:</p> <p>Encoder adjustment has been changed, the machine reference of the axis position may have changed, check the encoder adjustment.</p> <p>Other encoders:</p> <p>The reference point of the axis position has been changed, check the referencing procedure.</p> |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                    |

---

**4075 Machine data %1 (and maybe others) not changed due to missing permission level %2**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | <p>%1 = String: MD identifier</p> <p>%2 = Write protection level of the MD</p>                                                                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | On executing an MD file or when writing machine data from the part program, an attempt has been made to write an item of data with a higher protection level than the access authorization currently set in the control. The item of data in question has not been written and program execution is continued. This alarm is set only when a write access violation is detected for the first time. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Set the required access level by means of keyswitch or password entry or delete the machine data concerned from the MD file/part program.                                                                                                                                                                                                |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                        |

|                    |                                                                   |
|--------------------|-------------------------------------------------------------------|
| <b>Parameters:</b> | <p>%1 = Number of MDs</p> <p>%2 = Preset access authorization</p> |
|--------------------|-------------------------------------------------------------------|

|                               |                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | On executing a TOA file or when writing data from the part program an attempt has been made to write data with a higher protection level than the access authorization currently set in the control. The data in question have not been written and program execution is continued without hindrance. This alarm is issued on acknowledging alarm 4075. It can be cleared only with Power ON. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Set the required access level by means of keyswitch or password entry or delete the machine data concerned from the MD file/part program.                                                                                                                                                                                          |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Explanation:</b>           | <p>An attempt was made to enter a new value in the specified memory configuration machine data. It was not possible to modify the value, as this would have required more user memory than was available.</p> <p>The third parameter specifies the number of kilobytes by which the maximum user memory would be exceeded. Note: 1 kB = 1024 bytes. 1 MB = 1024 kB.</p> <p>The fourth parameter specifies the type of memory whose limit was exceeded.</p> <ul style="list-style-type: none"> <li>- "D" stands for dynamic or non-buffered user memory. This is where, for example, the LUD variables are stored and the interpolation buffer size is entered. The capacity of this memory type can be taken from MD18210 \$MN_MM_USER_MEM_DYNAMIC, and is defined by OD19240 \$ON_USER_MEM_DYNAMIC.</li> <li>- "S" stands for static or buffered user memory. Part programs, offset data, R parameters, tool data, etc. are typically stored there. The capacity of this memory type can be taken from MD18230 \$MN_MM_USER_MEM_BUFFERED, and is defined by OD19250 \$ON_USER_MEM_BUFFERED.</li> <li>- "IS" stands for internal static or buffered user memory. This memory type is defined by the current memory configuration and is not settable. A few NCK functions use this memory.</li> </ul> |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | <p>You can continue without making a change. The alarm has no negative effects.</p> <p>To make the change, you have the following possibilities of eliminating the error. Note that removing the access right depends on the current memory configuration of the NCK:</p> <ul style="list-style-type: none"> <li>- Try again with a lower value. Observe the change in the value of parameter 3.</li> <li>- If the control model used allows it, enlarge the memory. Note that this is not possible if parameter 4 equals "IS".</li> <li>- If permissible, enlarge the NCK user memory. With the appropriate access authorization, you can change the machine data (see above). An increase in buffered memory is generally subject to charge.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Remedy:</b>                | You have the following possibilities of eliminating the error: <ul style="list-style-type: none"> <li>Configure an M function in MD10715 \$MN_M_NO_FCT_CYCLE[n] that is not occupied by the system.</li> <li>Configure a valid array index in MD10718 \$MN_M_NO_FCT_CYCLE_PAR.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Programm continuation:** Switch control OFF - ON.

---

**4152 Illegal configuration of the 'Block display with absolute values' function**

**Explanation:** The "Block display with absolute values" function has been illegally parameterized:  
- An illegal block length has been set with MD28400 \$MC\_MM\_ABSBLOCK:  
While ramping up, the machine data will be checked for the following value range:  
0, 1, 128 to 512  
- An invalid display range has been set with MD28402 \$MC\_MM\_ABSBLOCK\_BUFFER\_CONF[. While ramping up, the machine data will be checked for the following upper and lower limits:  
0 <= MD28402 \$MC\_MM\_ABSBLOCK\_BUFFER\_CONF[0] <= 8  
0 <= MD28402 \$MC\_MM\_ABSBLOCK\_BUFFER\_CONF[1] <= (MD28060 \$MC\_MM\_IPO\_BUFFER\_SIZE + MD28070 \$MC\_MM\_NUM\_BLOCKS\_IN\_PREP).  
Alarm 4152 is issued if the limits are violated.

**Reaction:** Mode group not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Configure block length/display range within the permissible limits.

**Programm continuation:** Switch control OFF - ON.

---

**4170 Invalid M function number for channel synchronisation assigned**

**Explanation:** An M number between 0 and 99 has been specified In machine data MD10800 \$MN\_EXTERN\_CHAN\_SYNC\_M\_NO\_MIN or MD10802 \$MN\_EXTERN\_CHAN\_SYNC\_M\_NO\_MAX for the configuration of the M number range for channel synchronization in ISO2/3 mode or the machine data MD10802 \$MN\_EXTERN\_CHAN\_SYNC\_M\_NO\_MAX is smaller than MD10800 \$MN\_EXTERN\_CHAN\_SYNC\_M\_NO\_MIN.

**Reaction:** Mode group not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Check MD10800 \$MN\_EXTERN\_CHAN\_SYNC\_M\_NO\_MIN and MD10802 \$MN\_EXTERN\_CHAN\_SYNC\_M\_NO\_MAX.

**Programm continuation:** Switch control OFF - ON.

---

**4182 [Channel %1: ] Invalid M auxiliary function number in %2%3, MD reset**

**Parameters:** %1 = Channel number  
%2 = MD identifier  
%3 = If required, MD index

**Explanation:** In the specified machine data, a number has been specified for the configuration of an M function which is occupied by the system, and cannot be used for an assignment. (M0 to M5, M17, M30, M40 to M45 and also M98, M99 with applied ISO dialect). The value set by the user has been reset to the default value by the system.

**Reaction:** Mode group not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

|                               |                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remedy:</b>                | Configure an M function in the specified machine data which is not occupied by the system (M0 to M5, M17, M30, M40 to M45 and also M98, M99 with applied ISO dialect). |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                   |

---

#### 4183 [Channel %1: ] M auxiliary function number %2 used several times (%3 and %4)

|                               |                                                                                                                                                       |

#### 4230 [Channel %1: ] Data alteration from external not possible in current channel state

|                               |                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number                                                                                                                                    |
| <b>Explanation:</b>           | It is not allowed to enter this data while the part program is being executed (e.g. setting data for working area limitation or for dry run feedrate). |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                         |
| <b>Remedy:</b>                | The data to be entered must be altered before starting the part program.                                                                               |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                           |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>4240</b>                   | <b>Runtime overflow on the IPO or position controller level %1 Parameter %2 %3 %4</b>                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters:</b>            | <p>%1 = Operating system error number<br/>%2 = Operating system error parameter 1<br/>%3 = Operating system error parameter 2<br/>%4 = Operating system error parameter 3</p>                                                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | <p>The settings for the interpolation and position control cycle were modified before the last power-up such that too little computing time is now available for the requisite cyclic task.</p> <p>The alarm occurs immediately after power-up if too little runtime is available even when the axes are stationary and the NC program has not started. However, task overflow can occur only when computation-intensive NC functions are called during program execution.</p> |
| <b>Reaction:</b>              | <p>NC not ready.</p> <p>The NC switches to follow-up mode.</p> <p>Mode group not ready, also effective for single axes.</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm.</p> <p>Alarm reaction delay is canceled.</p>                                                                                                                                                                                 |
| <b>Remedy:</b>                | <p>Please inform the authorized personnel/service department.</p> <p>Take greater care when optimizing the clock times MD10050 \$MN_SYSCLOCK_CYCLE_TIME, MD10060 \$MN_POSCTRL_SYSCLOCK_TIME_RATIO and/or MD10070 \$MN_IPO_SYSCLOCK_TIME_RATIO.</p> <p>The test should be performed with an NC program that represents the highest possible control load. To be on the safe side, a margin of 15 to 25% should be added to the times determined in this way.</p>                |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Check hardware or correct the MD, if necessary. Note: monitoring of the hardware configuration is performed independently of the number of activated inputs/outputs (MD10300 \$MN_FASTIO_ANA_NUM_INPUTS, MD10310 \$MN_FASTIO_ANA_NUM_OUTPUTS, MD10350 \$MN_FASTIO_DIG_NUM_INPUTS, MD10360 \$MN_FASTIO_DIG_NUM_OUTPUTS) |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                                                                                          |
| <b>4282</b>                   | <b>Hardware of external NCK outputs assigned repeatedly</b>                                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | Several outputs have been configured on the same hardware byte.                                                                                                                                                                                                                                                                                                                   |
| <b>Reaction:</b>              | NC not ready.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                     |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Alter MD10368 \$MN_HW_ASSIGN_DIG_FASTOUT or MD10364 \$MN_HW_ASSIGN_ANA_FASTOUT.                                                                                                                                                                                                                                        |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                                                                                          |
| <b>4300</b>                   | <b>Declaration in MD %1 is not allowed for axis %2.</b>                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters:</b>            | %1 = String: MD identifier<br>%2 = Axis name, spindle number                                                                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | The axis cannot be operated as competing positioning axes,<br>for example because the axis is the slave axis within a closed gantry group or a gantry group to be closed.                                                                                                                                                                                                         |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                    |

**Remedy:** Please inform the authorized personnel/service department. Reset MD30450 \$MA\_IS\_CONCURRENT\_POS\_AX for the axis concerned.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**4310 Declaration in MD %1 index %2 is not allowed.**

**Parameters:** %1 = String: MD identifier  
%2 = Index: MD array index

**Explanation:** The machine data values must be written in the array in ascending order.

**Reaction:** Mode group not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Inform the authorized personnel/service department. Correct the MD.

**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

---

**4320 Axis %1 function %2 %3 and %4 not allowed**

**Parameters:** %1 = String: Axis identifier  
%2 = String: MD identifier  
%3 = String: Bit  
%4 = String: MD identifier

**Explanation:** The functions declared by the specified machine data cannot simultaneously be active for one axis.

**Reaction:** Mode group not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Deactivate one of the two functions.

**Programm continuation:** Switch control OFF - ON.

---

**4334 [Channel %1: ] The amount of fine correction in parameter %2 of the orientable toolholder %3 is too large**

**Parameters:** %1 = Channel number  
%2 = Invalid parameter of the orientable toolholder  
%3 = Number of the orientable toolholder

**Explanation:** The maximum permissible value of the fine correction in an orientable toolholder is limited by the MD20188 \$MC\_TOCARR\_FINE\_LIM\_LIN for linear variables, and by the MD20190 \$MC\_TOCARR\_FINE\_LIM\_ROT for rotary variables. The alarm can only occur if the SD42974 \$SC\_TOCARR\_FINE\_CORRECTION is not equal to zero.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm at block end.

**Remedy:** Enter a valid fine correction value.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

|                               |                                                                                                                                                                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>4336</b>                   | <b>[Channel %1: ] Orientable toolholder no. %2 for orientation transformation %3 does not exist</b>                                                                                                                                     |

|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>This alarm is output if an attempt is made to set multiple transformations of a group.</p> <p>Only a limited number of machine data sets, usually 2, is available for each related group of transformations (e.g. orientation transformations, Transmit, Tracyl, etc.).</p> <p>Example:</p> <p>Two orientation transformations are allowed. The machine data contains, for example:</p> <p>TRAFO_TYPE_1 = 16 ; 1st orientation transformation</p> <p>TRAFO_TYPE_2 = 33 ; 2nd orientation transformation</p> <p>TRAFO_TYPE_3 = 256 ; 1st transmit transformation</p> <p>TRAFO_TYPE_4 = 20 ; 3rd orientation transformation ==&gt; This entry triggers the alarm</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm at block end.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | Enter valid machine data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>A chained transformation is incorrectly configured (MD24995 \$MC_TRACON_CHAIN_1 or MD24996 \$MC_TRACON_CHAIN_2). The following causes of the error are possible:</p> <ul style="list-style-type: none"> <li>- The list of transformations to be chained starts with a 0. At least one entry not equal to zero is required.</li> <li>- The list of transformations to be chained contains the number of a transformation which does not exist.</li> <li>- The number of a transformation in the list is greater than or equal to the number of the chained transformation. Example: The cascaded transformation is the fourth transformation in the system, i.e. MD24400 \$MC_TRAFO_TYPE_4 = 8192. In this case, only values 1, 2 or 3 may be entered in the associated list (e.g. MD24995 \$MC_TRACON_CHAIN_1[...]).</li> <li>- The chaining setting is invalid. The following restrictions currently apply. A maximum of two transformations can be chained. The first transformation must be an orientation transformation, transmit, peripheral curve transformation or inclined axis. The second transformation must be the inclined axis transformation.</li> </ul> |

Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                           |

---

|             |                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4348        | [Channel %1: ] Block %2 Configuration error %6 in transformation \$NT_NAME[%5] = '%3'.                                                                                                           |
| Parameters: | <div>%1 = Channel number</div> <div>%2 = Block number, label</div> <div>%3 = Name of the transformation data record</div> <div>%4 = Index of the transformation data record   error number</div> |

**Explanation:**

The transformation data set is incorrect. The cause of the error is given by the following error number:

- 1. The transformation type is not known, i.e. \$NT\_TRAFO\_TYPE[n] contains an invalid name.
- 2. The machine kinematics have not been defined, in other words, neither in \$NT\_T\_CHAIN\_LAST\_ELEM[n] nor in \$NT\_P\_CHAIN\_LAST\_ELEM[n] is there a reference to a kinematic chain element in the kinematic description of the machine.
- 3. The kinematic chain element with the name contained in \$NT\_T\_CHAIN\_LAST\_ELEM[n] has no connection to the root element.
- 4. The kinematic chain element with the name contained in \$NT\_P\_CHAIN\_LAST\_ELEM[n] has no connection to the root element.
- 5. The kinematic chain element with the name contained in \$NT\_T\_CHAIN\_LAST\_ELEM[n] was not found.
- 6. There is no kinematic chain element (MD18880 \$MN\_MM\_MAXNUM\_KIN\_CHAIN\_ELEM is zero).
- 8. The kinematic chain element with the name contained in \$NT\_P\_CHAIN\_LAST\_ELEM[n] was not found.
- 9. The kinematic chain element with the name contained in \$NT\_T\_REF\_ELEM[n] was not found.
- 10. The rotary axis defined in \$NT\_ROT\_AX\_NAME[n,0] was not found in the kinematic chain.
- 11. The rotary axis defined in \$NT\_ROT\_AX\_NAME[n,1] was not found in the kinematic chain.
- 12. The rotary axis defined in \$NT\_ROT\_AX\_NAME[n,2] was not found in the kinematic chain.
- 16. The rotary axis defined in \$NT\_ROT\_AX\_NAME[n,1] has been defined more than once.
- 17. The rotary axis defined in \$NT\_ROT\_AX\_NAME[n,2] has been defined more than once.
- 20. The linear axis defined in \$NT\_GEO\_AX\_NAME[n,0] was not found in the kinematic chain.
- 21. The linear axis defined in \$NT\_GEO\_AX\_NAME[n,1] was not found in the kinematic chain.
- 22. The linear axis defined in \$NT\_GEO\_AX\_NAME[n,2] was not found in the kinematic chain.
- 26. The linear axis defined in \$NT\_GEO\_AX\_NAME[n,1] has been defined more than once.
- 27. The linear axis defined in \$NT\_GEO\_AX\_NAME[n,2] has been defined more than once.
- 28. In the kinematic description of the transformation, a linear axis was specified more than once (at least two chain elements of the type AXIS\_LIN refer to the same machine axis in component \$NK\_AXIS[n]).
- 29. In the kinematic description of the transformation, a rotary axis was specified more than once (at least two chain elements of the type AXIS\_ROT refer to the same machine axis in component \$NK\_AXIS[n]).
- 30. The base orientation has not been defined, in other words, all three components of \$NT\_BASE\_ORIENT[n, 0..2] are zero.
- 31. The orientation normal vector has not been defined, in other words all three components of \$NT\_BASE\_ORIENT\_NORMAL[n, 0..2] are zero.
- 32. The vectors for definition of the base orientation (\$NT\_BASE\_ORIENT[n, 0..2]) and the base normal vector (\$NT\_BASE\_ORIENT\_NORMAL[n, 0..2]) are parallel.
- 36. The number of relevant rotary axes found in the part chain is not the same as the content of \$NT\_ROT\_AX\_CNT[n,0].
- 37. The number of relevant rotary axes found in the tool chain is not the same as the content of \$NT\_ROT\_AX\_CNT[n,1].
- 40. The first and the second orientation axes of an orientation transformation are parallel.
- 41. The second and the third orientation axes of an orientation transformation are parallel.
- 42. No orientation axis has been defined (an orientation transformation requires at least one orientation axis).
- 43. Invalid 3-axis orientation transformation: The orientation axis is not perpendicular to the plane created by the two geometry axes.
- 47. System variable \$NT\_CLOSE\_CHAIN\_P is disabled in the current software version, and may only contain the zero string.
- 48. The chain element specified in \$NT\_CLOSE\_CHAIN\_T was not found.
- 50. Fewer than two geometry axes have been defined for an orientation transformation or an inclined axis transformation.
- 51. Not all three geometry axes have been defined for an orientation transformation with more than one orientation axis.
- 60. Geometry axes 1 and 2 are parallel.
- 61. Geometry axes 1 and 3 are parallel.
- 62. Geometry axes 2 and 3 are parallel.
- 65. The 3 geometry axes are on one plane.
- 68. The function "Close the part chain" is not defined for this transformation.
- 69. The function "Close the tool chain" is not defined for this transformation.
- 80. Invalid definition sequence of orientation axes. The orientation axes in \$NT\_ROT\_AX\_NAME[n, 0..2] must be defined without gaps starting at index 0. The axis sequence in \$NT\_ROT\_AX\_NAME[n, 0..2] must be equal to the axis sequence in the kinematic chains (when running through the chains from the end of the part chain to the end of the tool chain).
- 81. An orientation axis has been programmed more than once.
- 82. Parameterization of the first orientation axis as a spindle is not permissible.

- 83. Parameterization of the second orientation axis as a spindle is not permissible.
- 84. Parameterization of the third orientation axis as a spindle is not permissible.
- 87. Parameterization of the first orientation axis as a Hirth axis is incorrect, in other words at least one of the machine data MD30502 \$MA\_INDEX\_AX\_DENOMINATOR, MD30501 \$MA\_INDEX\_AX\_NUMERATOR, or MD30330 \$MA\_MODULO\_RANGE (for modulo axes) is zero.
- 88. Parameterization of the second orientation axis as a Hirth axis is incorrect. The error conditions are the same as for error number 87.
- 89. Parameterization of the third orientation axis as a Hirth axis is incorrect. The error conditions are the same as for error number 87.
- 100. The maximum number of kinematic elements (sum of linear axes, rotary axes and constant elements) has been exceeded. In this case, a sequence of constant elements in a chain, which is not interrupted by an axis, is only considered as one element.

A maximum of 15 kinematic elements is currently permissible for orientation transformations.

- 101. The maximum number of rotary axes in the kinematic chains for the definition of a transformation has been exceeded.
- 103. The maximum number of elements in the definition of the kinematic chain for the tool has been exceeded.
- 104. The maximum number of elements in the definition of the kinematic chain for the workpiece has been exceeded.
- 105. The maximum permissible number of constant transformation axes (redundant (rotary) axes), which must not move with an active transformation, has been exceeded.

A maximum of 6 rotary axes is currently permissible for orientation transformations.

- 106. The maximum permissible number of chain elements for internal representation of the machine kinematics has been exceeded.
- 110. The kinematic chain element with the name contained in \$NT\_T\_CHAIN\_FIRST\_ELEM[n] was not found.
- 111. The kinematic chain element with the name contained in \$NT\_P\_CHAIN\_FIRST\_ELEM[n] was not found.
- 141. The three-bit number for identifying the permutation of the geometry axes (bit 11 to bit 13 in \$NT\_CNTRL[n] with Transmit or Tracyl) contains a value greater than 5.
- 142. Impermissible permutation of the geometry axes (bit 11 to bit 13 in \$NT\_CNTRL[n] with Transmit or Tracyl). In the assignment of the geometry axes to the input axes of the transformation, unassigned places must not be transposed.
- 143. The parameterization of the Transmit or Tracyl transformation requires a center offset axis.
- 144. An axis name must be entered in \$NT\_ROT\_AX\_NAME[n, 1], and only there.
- 145. After the polar axis (\$NT\_ROT\_AX\_NAME[n, 1]), an invalid offset has been entered in the kinematic chain in the direction toward the workpiece zero.
- 146. If bit 19 is set in \$NT\_CNTRL[n] for Transmit or Tracyl, the last element in the kinematic chain must be a rotary axis or a constant rotation.
- 149. After the polar axis (\$NT\_ROT\_AX\_NAME[n, 1]), an impermissible rotation is active in the direction toward the workpiece zero (constant rotation or constant rotary axis).
- 150. Impermissible type of chain element (system error).
- 160. No axis name entered in \$NT\_GEO\_AX\_NAME[n, 0].
- 161. No axis name entered in \$NT\_GEO\_AX\_NAME[n, 1] although a center offset axis specified.
- 170. The only defined geometry axis must be in \$NT\_GEO\_AX\_NAME[n, 2].
- 171. The parameter \$NT\_GEO\_AX\_NAME[n, 2] is empty. The entry in \$NT\_GEO\_AX\_NAME[n, 2] must always be present.
- 180. No spindle was defined (the interpolated turning transformation requires a spindle).
- 181. More than one rotary axis was defined (the interpolated turning transformation requires exactly one rotary axis that is defined as a spindle).
- 182. For the interpolated turning transformation, the spindle must be defined in \$NT\_ROT\_AX\_NAME[n, 0].
- 183. For the interpolated turning transformation, a rotary axis was defined in \$NT\_ROT\_AX\_NAME[n, 0] that is not configured as a spindle.
- 184. For the interpolated turning transformation, the direction of the spindle in \$NK\_OFF\_DIR was not entered as (0,0,-1).
- 200. At the end of the part chain, a correction element is defined although bit 7 is set in \$NT\_CNTRL[n] (close part chain).
- 201. At the start of the tool chain, a correction element is defined although bit 8 is set in \$NT\_CNTRL[n] (close tool chain).
- 300. The chain element to which \$NT\_CORR\_ELEM\_P[n, 0] refers was not found.
- 301. The chain element to which \$NT\_CORR\_ELEM\_P[n, 1] refers was not found.
- 302. The chain element to which \$NT\_CORR\_ELEM\_P[n, 2] refers was not found.
- 303. The chain element to which \$NT\_CORR\_ELEM\_P[n, 3] refers was not found.
- 310. The chain element to which \$NT\_CORR\_ELEM\_T[n, 0] refers was not found.

- 311. The chain element to which \$NT\_CORR\_ELEM\_T[n, 1] refers was not found.
- 312. The chain element to which \$NT\_CORR\_ELEM\_T[n, 2] refers was not found.
- 313. The chain element to which \$NT\_CORR\_ELEM\_T[n, 3] refers was not found.
- 320. The chain element to which \$NT\_CORR\_ELEM\_P[n, 0] refers is not in the associated section.
- 321. The chain element to which \$NT\_CORR\_ELEM\_P[n, 1] refers is not in the associated section.
- 322. The chain element to which \$NT\_CORR\_ELEM\_P[n, 2] refers is not in the associated section.
- 323. The chain element to which \$NT\_CORR\_ELEM\_P[n, 3] refers is not in the associated section.
- 330. The chain element to which \$NT\_CORR\_ELEM\_T[n, 0] refers is not in the associated section.
- 331. The chain element to which \$NT\_CORR\_ELEM\_T[n, 1] refers is not in the associated section.
- 332. The chain element to which \$NT\_CORR\_ELEM\_T[n, 2] refers is not in the associated section.
- 333. The chain element to which \$NT\_CORR\_ELEM\_T[n, 3] refers is not in the associated section.
- 500. No transformation chain is defined for a concatenated transformation, at least one transformation must be defined with \$NT\_TRACON\_CHAIN[.].
- 501. The transformation stated in \$NT\_TRACON\_CHAIN[n, 0] is not defined.
- 502. The transformation stated in \$NT\_TRACON\_CHAIN[n, 1] is not defined.
- 503. The transformation stated in \$NT\_TRACON\_CHAIN[n, 2] is not defined.
- 504. The transformation stated in \$NT\_TRACON\_CHAIN[n, 3] is not defined.
- 520. The stated transformation data block is defective on activation of a concatenated transformation.
- 521. The definition of the transformation chain leads to an endless recursion.
- 522. Too many concatenated transformations are defined for the definition of a transformation chain (8 is the maximum possible here).
- 523. An impermissible chain of partial transformations has been configured in a concatenated transformation.
- 1000. The OEM transformation cannot be activated because it was not logged on by the CC.
- 1001. The OEM transformation has been logged on as an orientation transformation, but it is not configured as an orientation transformation.
- 1002. The OEM transformation is configured as an orientation transformation, but it was not logged on as an orientation transformation.
- 1003. The activated OEM transformation does not behave like an orientation transformation, although the transformation was not configured or logged on for orientations.
- 1004. No geometry axes are defined for the activated OEM transformation (neither by the CC nor in the system variable \$NT\_GEO\_AX\_NAME[n, i]).
- 1005. No orientation axes are defined for the activated OEM transformation, although this was configured as an orientation transformation (neither by the CC nor in the system variable \$NT\_ROT\_AX\_NAME[n, i]).
- 1006. The OEM transformation does not support any rotation of the orientation, although the transformation was configured with 3 orientation axes.
- 1007. The OEM transformation was created for rotations of the orientation, but the transformation was not configured in this way (fewer than 3 orientation axes).
- 1050. The OEM transformation reports a general kinematic analysis error. (This occurs, for example, if the analyseChain() method has not been implemented in the CC.)
- 1051. An unknown element was discovered during the analysis of the kinematic chain by the OEM transformation.
- 1052. An offset element is incorrectly arranged in the kinematic chain for the OEM transformation.
- 1053. The stated arrangement of a linear axis is not allowed in the kinematic chain.
- 1054. The stated arrangement of a rotary axis is not allowed in the kinematic chain.
- 1055. The stated direction of a linear axis is not allowed in the kinematic chain.
- 1056. The stated direction of rotation of a rotary axis is not allowed in the kinematic chain.
- 1057. Reserved for error messages of the kinematic analysis of compile cycles.
- 1058. Reserved for error messages of the kinematic analysis of compile cycles.
- 1059. Reserved for error messages of the kinematic analysis of compile cycles.

- 1089. Reserved for error messages from the analysis of the transformation parameters of compile cycles.
- 1090. Reserved for error messages from the analysis of the transformation parameters of compile cycles.
- 10000. Invalid redundant rotary axis. Only one redundant rotary axis is permissible for orientation transformation (for the time being). This rotary axis must be the first axis in the kinematic chain.

Note:

Parameter 4 contains the descriptions of parameters 5 and 6 separated by the "|" character.

- 5 = Index of the transformation data block
- 6 = Error code

**Reaction:**

Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm at block end.

**Remedy:**

Define valid transformation data record.

**Programm  
continuation:**

Clear alarm with the RESET key. Restart part program

---

**4349**

**[Channel %1: ] No free memory space available for transformations.**

**Parameters:**

%1 = Channel number  
%2 = Number of the transformations already active

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | Any kinematic transformation in the NCK requires a defined memory space. If MD18866 \$MN_MM_NUM_KIN_TRAFOS does not equal zero, it indicates how many kinematic transformations are allowed to be active in the NCK at the same time. If MD18866 \$MN_MM_NUM_KIN_TRAFOS equals zero, the maximum number of kinematic transformations that are active at the same time, is determined automatically (currently twenty times the number of the existing channels). |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                                                                                                                                                                                                                                                                                                                                               |
| <b>Remedy:</b>                | Increase the value of MD18866 \$MN_MM_NUM_KIN_TRAFOS.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                 |

|                               |                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>4400</b>                   | <b>MD alteration will cause reorganization of buffered memory (Art %1), (loss of data!) - %2</b>                                                                                                                                                                                                                                                                                      |
| <b>Parameters:</b>            | %1 = Memory type<br>%2 = MD identifier, if required                                                                                                                                                                                                                                                                                                                                   |
| <b>Explanation:</b>           | A machine data has been altered that configures the buffered memory. If the NCK powers up with the altered data, this will lead to reorganization of the buffered memory and thus to the loss of all buffered user data (part programs, tool data, GUD, leadscrew error compensation, ...)<br>Meaning of the 1st parameter<br>0x00 buffered memory (internal)<br>0x01 buffered memory |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | If the control includes user data that have not yet been saved, then a data backup must be performed before the next NC power-up. By manually resetting the altered MD to the value it had before the last power-up, reorganization of the memory can be avoided.                                                                                                                     |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                                                                                                                                                                |

|                               |                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>4402</b>                   | <b>%1 causes a machine data reset</b>                                                                                                                                                                                                                                                                                        |
| <b>Parameters:</b>            | %1 = Machine data                                                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | If this machine data is set, the current machine data values are overwritten by the default values at the next ramp-up. Under certain circumstances, this may cause data loss (even in the buffered memory).                                                                                                                 |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                               |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. If the control includes user data that has not yet been saved, then a data backup must be performed before the next NCK power-up. By manually resetting the altered MD to the value it had before the last power-up, reorganization of the memory can be avoided. |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                                                                                                       |

| <b>Programm continuation:</b> | Switch control OFF - ON.                                                             |

|                     |                                                                             |
|---------------------|-----------------------------------------------------------------------------|
| <b>4501</b>         | <b>While reading the AMR backup file %1, error %2 occurred (data loss!)</b> |
| <b>Parameters:</b>  | %1 = File name<br>%2 = Error code                                           |
| <b>Explanation:</b> | The backup file for automatic memory reconfiguration could not be read      |

**Reaction:** Alarm display.  
**Remedy:** Please inform the authorized personnel/service department.  
**Programm continuation:** Switch control OFF - ON.

---

**4503 [TO unit %1: ] H number %2 assigned more than once. Machine data is not set.**

**Parameters:** %1 = TO unit  
%2 = H number

**Explanation:** This error can only occur if MD10880 \$MN\_MM\_EXTERN\_CNC\_SYSTEM= 1 or 2. MD10890, \$MN\_EXTERN\_TOOLPROG\_MODE bit 3 is reset (this MD becomes effective at power-on). On checking data management, it was found that various edges of the same TO unit had the same H number. MD10890 \$MN\_EXTERN\_TOOLPROG\_MODE bit 3 remains set and is not included in data management.

**Reaction:** Alarm display.

**Remedy:** H numbers must be assigned only once in a TO unit. Then, MD10890, \$MN\_EXTERN\_TOOLPROG\_MODE, bit 3 can be set = 0 and a restart can be performed.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**4600 Invalid handwheel type for handwheel %1**

**Parameters:** %1 = Handwheel number

**Explanation:** The handwheel type (hardware segment) for handwheel %1 requested through MD11350 \$MN\_HANDWHEEL\_SEGMENT is invalid.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** Configure a valid type for the corresponding handwheel through MD11350 \$MN\_HANDWHEEL\_SEGMENT.

**Programm continuation:** Switch control OFF - ON.

---

**4610 Invalid handwheel module for handwheel %1**

**Parameters:** %1 = Handwheel module

**Explanation:** The handwheel module for handwheel %1 requested through MD11351 \$MN\_HANDWHEEL\_MODULE is not available. Therefore MD11351 \$MN\_HANDWHEEL\_MODULE = 1 must always be set for directly connected handwheels.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** Set machine data MD11351 \$MN\_HANDWHEEL\_MODULE = 1 for the corresponding handwheel.

**Programm continuation:** Switch control OFF - ON.

---

**4611 Invalid handwheel input for handwheel %1**

**Parameters:** %1 = Handwheel input

**Explanation:** The handwheel input for handwheel %1 requested through MD11352 \$MN\_HANDWHEEL\_INPUT is not available. A maximum of 2 or 3 handwheels can be connected directly to diverse systems.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** Configure MD11352 \$MN\_HANDWHEEL\_INPUT for a valid input for the corresponding handwheel

**Programm continuation:** Switch control OFF - ON.

---

**4620 Invalid handwheel module for handwheel %1**

**Parameters:** %1 = Handwheel module

|                               |                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Handwheel input                                                                                                                                       |
| <b>Explanation:</b>           | The handwheel input for handwheel %1 requested through MD11352 \$MN_HANDWHEEL_INPUT is not available. A maximum of 2 handwheels can be directly connected. |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                               |
| <b>Remedy:</b>                | Configure MD11352 \$MN_HANDWHEEL_INPUT for a valid input for the corresponding handwheel.<br>MD11350 \$MN_HANDWHEEL_SEGMENT should also be checked.        |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                   |

---

#### 4630 Invalid handwheel module for handwheel %1

|                               |                                                                                                                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Handwheel module                                                                                                                                                                                                                |
| <b>Explanation:</b>           | For PROFIBUS/PROFINET only:<br>The reference in \$MN_HANDWHEEL_MODULE to a corresponding entry in machine data array \$MN_HANDWHEEL_LOGIC_ADDRESS[] which is required for configuring PROFIBUS/PROFINET handwheels is not available. |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                                                                         |
| <b>Remedy:</b>                | Configure the machine data MD11351 \$MN_HANDWHEEL_MODULE for the corresponding PROFIBUS/PROFINET handwheel so that there is a valid reference to an entry in the machine data array MD11353 \$MN_HANDWHEEL_LOGIC_ADDRESS[].          |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                             |

---

#### 4631 Invalid handwheel slot for handwheel %1

|                               |                                                                                                                                                                           |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Handwheel slot                                                                                                                                                       |
| <b>Explanation:</b>           | For PROFIBUS/PROFINET only:<br>The handwheel slot for handwheel %1 requested through machine data \$MN_HANDWHEEL_INPUT is not available for PROFIBUS/PROFINET handwheels. |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                              |
| <b>Remedy:</b>                | Configure machine data MD11352 \$MN_HANDWHEEL_INPUT to a valid handwheel slot for the corresponding PROFIBUS/PROFINET handwheel.                                          |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                  |

---

#### 4632 Logical PROFIBUS/PROFINET handwheel slot base address for %1. handwheel not found

|                     |                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Handwheel number                                                                                                                                                                                                                                             |
| <b>Explanation:</b> | For PROFIBUS/PROFINET only:<br>The logical basic address of the PROFIBUS/PROFINET handwheel slot in machine data array \$MN_HANDWHEEL_LOGIC_ADDRESS[] indexed in machine data \$MN_HANDWHEEL_MODULE was not found in the current PROFIBUS/PROFINET configuration. |
| <b>Reaction:</b>    | Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                      |

**Remedy:** Check if MD11351 \$MN\_HANDWHEEL\_MODULE of the corresponding handwheel is correct. Check if indexed logical base address of PROFIBUS/PROFINET handwheel slot in machine data array MD11353 \$MN\_HANDWHEEL\_LOGIC\_ADDRESS[] is correct.

**Programm continuation:** Switch control OFF - ON.

---

**4640 Invalid handwheel module for handwheel %1**

**Parameters:** %1 = Handwheel module

**Explanation:** For ETHERNET only:

The handwheel module for handwheel %1 requested through MD11351 \$MN\_HANDWHEEL\_MODULE is not available for ETHERNET handwheels. MD11351 \$MN\_HANDWHEEL\_MODULE = 1 must always be set when configuring ETHERNET handwheels.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** Set machine data MD11351 \$MN\_HANDWHEEL\_MODULE = 1 for the corresponding handwheel.

**Programm continuation:** Switch control OFF - ON.

---

**4641 Invalid handwheel input for handwheel %1**

**Parameters:** %1 = Handwheel input

**Explanation:** For ETHERNET only:

The handwheel input for handwheel %1 requested through MD11352 \$MN\_HANDWHEEL\_INPUT is not available for ETHERNET handwheels. A maximum of 6 handwheels can be configured.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** Configure MD11352 \$MN\_HANDWHEEL\_INPUT for a valid input for the corresponding handwheel

**Programm continuation:** Switch control OFF - ON.

---

**5000 Communication job not executable %1**

**Parameters:** %1 = Reference to which resources are no longer available.

**Explanation:** The communication job cannot be executed because there is insufficient memory space. Cause: too many communication jobs in parallel.

**Reaction:** Alarm display.

**Remedy:** Please notify the authorized service personnel.

Reduce the number of communication jobs taking place at the same time or increase MD10134 \$MN\_MM\_NUM\_MMC\_UNITS

The alarm can be suppressed with MD11410 \$MN\_SUPPRESS\_ALARM\_MASK bit 15.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**5010 Communication job not executable %1**

**Parameters:** %1 = Reference to which resources are no longer available.

**Explanation:** The communication job cannot be executed because there is insufficient memory space. Cause: too many communication jobs in parallel.

**Reaction:** Alarm display.

**Remedy:** Please notify the authorized service personnel.

Reduce the number of communication jobs taking place simultaneously. Resources cannot be increased any further.

The alarm can be suppressed with MD11410 \$MN\_SUPPRESS\_ALARM\_MASK bit 15.

**Programm continuation:** Clear alarm with the Delete key or NC START.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>5020</b>                   | <b>Communication job is too extensive %1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters:</b>            | %1 = Indication of what is illegal.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Explanation:</b>           | The communication job is illegal. Cause: the job is too extensive for the size of the PDU used.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Remedy:</b>                | Please notify the authorized service personnel.<br>Correct the configuration of the communication job on the client side (HMI, PLC or OPCUA).<br>The alarm can be suppressed with MD11415 \$MN_SUPPRESS_ALARM_MASK2 bit 27.                                                                                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>5030</b>                   | <b>Communication job not executable %1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Parameters:</b>            | %1 = Reference to which resources are no longer available.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | The communication job cannot be executed because the transmission path of the communication is generally overloaded.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Remedy:</b>                | Please notify the authorized service personnel.<br>Check whether more devices are connected to the NCK than is permitted.<br>The alarm can be suppressed with MD11415 \$MN_SUPPRESS_ALARM_MASK2 bit 28.                                                                                                                                                                                                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>6000</b>                   | <b>Memory reorganized using standard machine data</b>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | The memory management was not able to allocate the NC user memory with the values in the machine data. It did not have enough memory available because the total memory available is provided as dynamic and static memory for the NC user (e.g. for macro definitions, user variables, number of tool offsets, number of directories and files etc.).                                                                                                                           |
| <b>Reaction:</b>              | NC not ready.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | Redefine the NC memory structure!<br>A specific MD for NC user memory allocation cannot be stated to be the cause of the alarm. The MD initiating the alarm therefore has to be determined on the basis of the default values in the machine data by changing the user-specific memory structure step by step.<br>Usually, it is not just one single MD that has been set too large. Therefore it is advisable to reduce the memory area by a certain proportion in several MDs. |
| <b>Programm continuation:</b> | Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>6010</b>                   | <b>[Channel %1: ] Data block %2 not or not completely created, error code %3</b>                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = String (block name)<br>%3 = Internal error code                                                                                                                                                                                                                                                                                                                                                                                                      |

**Explanation:** Data management has detected an error during ramp-up. The specified data block may not have been created. The error number specifies the type of error. An error number >100000 indicates a fatal system error. Other error numbers indicate that the user memory area provided is too small. In this case the (user) error numbers have the following meaning:

- Error number 1: No memory space available
- Error number 2: Maximum possible number of symbols exceeded
- Error number 3: Index 1 lies outside the valid value range
- Error number 4: Name already exists in channel
- Error number 5: Name already exists in NCK

If the alarm occurs after cycle programs, macro definitions or definitions for global user data (GUD) have been introduced, the machine data for the user memory configuration has been configured incorrectly. In all other cases, changes to machine data that is already correct lead to errors in the user memory configuration.

The following block names (2nd parameter) are known in the NCK (all system and user data blocks; in general, only problems in the user data blocks can be remedied by user intervention):

- \_N\_NC\_OPT - System internal: option data, NCK global
- \_N\_NC\_SEA - System internal: setting data, NCK global
- \_N\_NC\_TEA - System internal: machine data, NCK global
- \_N\_NC\_CEC - System internal: 'cross error compensation'
- \_N\_NC\_PRO - System internal: protection areas, NCK global
- \_N\_NC\_GD1 - User: 1st GUD block defined by \_N\_SGUD\_DEF, NCK global
- \_N\_NC\_GD2 - User: 2nd GUD block defined by \_N\_MGUD\_DEF, NCK global
- \_N\_NC\_GD3 - User: 3rd GUD block defined by \_N\_UGUD\_DEF, NCK global
- \_N\_NC\_GD4 - User: 4th GUD block defined by \_N\_GUD4\_DEF, NCK global
- \_N\_NC\_GD5 - User: 5th GUD block defined by \_N\_GUD5\_DEF, NCK global
- \_N\_NC\_GD6 - User: 6th GUD block defined by \_N\_GUD6\_DEF, NCK global
- \_N\_NC\_GD7 - User: 7th GUD block defined by \_N\_GUD7\_DEF, NCK global
- \_N\_NC\_GD8 - User: 8th GUD block defined by \_N\_GUD8\_DEF, NCK global
- \_N\_NC\_GD9 - User: 9th GUD block defined by \_N\_GUD9\_DEF, NCK global
- \_N\_NC\_MAC - User: macro definitions
- \_N\_NC\_FUN - System internal: predefined functions and procedures, NCK global
- \_N\_CHc\_OPT - System internal: option data, channel-specific
- \_N\_CHc\_SEA - System internal: setting data, channel-specific
- \_N\_CHc\_TEA - System internal: machine data, channel-specific
- \_N\_CHc\_PRO - System internal: protection areas, channel-specific
- \_N\_CHc\_UFR - System internal: frames, channel-specific
- \_N\_CHc\_RPA - System internal: R-variables, channel-specific
- \_N\_CHc\_GD1 - User: 1st GUD block defined by \_N\_SGUD\_DEF, channel-specific
- \_N\_CHc\_GD2 - User: 2nd GUD block defined by \_N\_MGUD\_DEF, channel-specific
- \_N\_CHc\_GD3 - User: 3rd GUD block defined by \_N\_UGUD\_DEF, channel-specific
- \_N\_CHc\_GD4 - User: 4th GUD block defined by \_N\_GUD4\_DEF, channel-specific
- \_N\_CHc\_GD5 - User: 5th GUD block defined by \_N\_GUD5\_DEF, channel-specific
- \_N\_CHc\_GD6 - User: 6th GUD block defined by \_N\_GUD6\_DEF, channel-specific
- \_N\_CHc\_GD7 - User: 7th GUD block defined by \_N\_GUD7\_DEF, channel-specific
- \_N\_CHc\_GD8 - User: 8th GUD block defined by \_N\_GUD8\_DEF, channel-specific
- \_N\_CHc\_GD9 - User: 9th GUD block defined by \_N\_GUD9\_DEF, channel-specific
- \_N\_AXa\_OPT - System internal: option data, axial
- \_N\_AXa\_SEA - System internal: setting data, axial
- \_N\_AXa\_TEA - System internal: machine data, axial
- \_N\_AXa\_EEC - System internal: leadscrew error compensation data, axial
- \_N\_AXa\_QEC - System internal: quadrant error compensation data, axial
- \_N\_ToT\_TOc - System internal: toolholder data, TOA-specific
- \_N\_ToT\_TOA - System internal: tool data, TOA-specific
- \_N\_ToT\_TMA - System internal: magazine data, TOA-specific
- \_N\_NC\_KIN - System internal: data to describe kinematic chains, NCK-specific

- `_N_NC_NPA` - System internal: data to describe 3D protection areas, NCK-specific
- `_N_NC_TRA` - System internal: transformation data sets, NCK-specific
- `_N_NC_WAL` - System internal: data to describe coordinate-specific working area limitation
- `_N_COMPLETE_CYD` - System internal: cycle and display machine data, NCK-, channel-, axis-specific

c = Channel number

a = Machine axis number

t = TOA unit number

There are also other internal system data blocks with identifiers.

**Reaction:**

NC not ready.

Channel not ready.

NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm.

**Remedy:**

Correct the machine data or undo the changes made.

Please inform the authorized personnel/service department. There are two determining machine data for cycle programs:

- MD18170 `$MN_MM_NUM_MAX_FUNC_NAMES` = max. number of all cycle programs, error number = 2 shows that this value is too small.

- MD18180 `$MN_MM_NUM_MAX_FUNC_PARAM` = max. number of all parameters defined in the cycle programs, error number = 2 shows that this value is too small

(If these MDs are modified, the memory backup is retained)

The following applies to macro definitions:

MD18160 `$MN_MM_NUM_USER_MACROS` = max. number of all macro definitions, error number = 2 shows that this value is too small.

(If these MDs are modified, the memory backup is retained)

The following applies to GUD variables:

- MD18118 `$MN_MM_NUM_GUD_MODULES` = max. number of GUD data blocks per area (NCK/channel) (if GD1, GD2, GD3, GD9 are to be defined, then the value must be = 9 and not e.g. = 4).

- MD18120 `$MN_MM_NUM_GUD_NAMES_NCK` = max. number of all NCK global GUD variables, error number = 2 shows that this value is too small.

- MD18130 `$MN_MM_NUM_GUD_NAMES_CHAN` = max. number of all channel-specific GUD variables in the channel, error number = 2 shows that this value is too small.

- MD18150 `$MN_MM_GUD_VALUES_MEM` = total value memory of all GUD variables together, error number = 1 shows that this value is too small.

**Programm continuation:**

Switch control OFF - ON.

## 6020

### Machine data have been changed - now memory %1 is reorganized

**Parameters:**

%1 = Detailed information

**Explanation:**

Machine data have been changed that define the NC user memory allocation. Data management has restructured the memory in accordance with the altered machine data.

Meaning of the parameter value:

- AFS = The active file system was reconfigured. The files of the passive file system were retained.

- PFS/AFS = The passive and active file systems were reconfigured.

Via the machine data `$MN_IS_AUTOMATIC_MEM_RECONFIG` it is configured whether NCK configures the AFS automatically (value=TRUE) or not (value=FALSE).

**Reaction:**

Alarm display.

**Remedy:**

No remedial measures are required. Any user data that are required must be input again.

**Programm continuation:**

Clear alarm with the RESET key. Restart part program

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Parameters:</b>            | %1 = Free memory capacity in KB defined for the control model<br>%2 = Actual maximum capacity of free memory in KB<br>%3 = Type of memory, "D" =non-battery-backed, "S" =battery-backed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | <p>The alarm can only occur after a 'cold start' (=NCK start-up with standard machine data). The alarm is only a notice. There is no interference with any NCK functions. It shows that the NCK has less free user memory available than specified by Siemens for this control variant. The value of the actually available free user memory can also be taken from the MD18050 \$MN_INFO_FREE_MEM_DYNAMIC, MD18060 \$MN_INFO_FREE_MEMS_STATIC.</p> <p>Siemens supplies NCK with default settings that, depending on the model, have certain (free) memory space available for the specific settings of the actual applications. The original factory setting of NCK systems is thus that the alarm does not occur with a cold start.</p>     |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | Reasons for the message: <ul style="list-style-type: none"> <li>- The NCK contains compile cycle software, that uses so much memory space that the hardware cannot provide the required memory.</li> <li>- The NCK runs on hardware that is not intended for this NCK release (i.e. that has not enough memory capacity).</li> <li>- If the application runs properly with the remaining free user memory (i.e. can be setup without any errors), the message can simply be ignored.</li> <li>- If the actual application cannot be configured because there is not enough memory capacity available, either the existing compile cycle must be reduced or, if possible, the system must be upgraded with additional memory space.</li> </ul> |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. | <b>Explanation:</b>           | The tool cannot be moved into the selected tool magazine. There is no appropriate location for this tool. A suitable location is mainly determined by the status. The status must indicate that this location is free, not disabled, not reserved and not co-occupied by a tool that is too large. Furthermore, it is important that the type of tool matches the type of any magazine location that may be free. (If, for example, all magazine locations are of the 'B' type and these are all free and the tool is of type 'A', then this tool cannot be put into this magazine).                                                                                                                                                          |

| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | - Check whether the magazine data are correctly defined (especially the location type).<br>- Check whether the tool data are correctly defined (especially the location type).                                                                                                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                         |
| <b>6409</b>                   | <b>[Channel %1: ] Block %2 If MTH is programmed then T must also be programmed.</b>                                                                                                                                                                                                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                          |
| <b>Explanation:</b>           | Function: Multitools and T= location programming. There is no T programming in the block. Only MTL is programmed.                                                                                                                                                                                                                                        |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Correct NC program:<br>- Program T in the block<br>- or delete MTL from the block                                                                                                                                                                                                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                         |

---

**6410 [TO unit %1: ] Tool %2 has reached its prewarning limit with D = %4**

**Parameters:** %1 = TO unit  
%2 = Tool identifier (name)  
%3 = -Not used-  
%4 = D number

**Explanation:** Tool monitoring: This message informs that the specified D offset has reached its prewarning limit for a time-, quantity- or wear-monitored tool. If possible, the D number is displayed; if not, value 0 is assigned to the 4th parameter.  
If the function additive offset is being used, additive offset monitoring may be active instead of tool wear monitoring. The actual type of tool monitoring is a tool property (see \$TC\_TP9). If replacement tools are not being used, the duplo number specified has no meaning. The alarm is triggered through the HMI or PLC (=OPI interface). The channel context is not defined. The TO unit was specified for this reason (see MD28085 \$MC\_MM\_LINK\_TOA\_UNIT).

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** This alarm is for information only. Check the possible ways of eliminating the error.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**6411 [Channel %1: ] Tool %2 has reached its prewarning limit with D = %4**

**Parameters:** %1 = Channel number  
%2 = Tool identifier (name)  
%3 = -Not used-  
%4 = D number

**Explanation:** Tool monitoring: This message informs that the specified D offset has reached its prewarning limit for a time-, quantity- or wear-monitored tool. If possible, the D number is displayed; if not, value 0 is assigned to the 4th parameter.  
If the function additive offset is being used, additive offset monitoring may be active instead of tool wear monitoring. The actual type of tool monitoring is a tool property (see \$TC\_TP9).  
If replacement tools are not being used, the duplo number specified has no meaning.  
The alarm originates during NC program execution.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** This alarm is for information only. Check the possible ways of eliminating the error.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**6412 [TO unit %1: ] Tool %2 has reached its monitoring limit with D = %4**

**Parameters:** %1 = TO unit  
%2 = Tool identifier (name)

| <b>6430</b>                   | <b>Workpiece counter: overflow in table of monitored cutting edges.</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Explanation:</b>           | <p>No more cutting edges can be entered in the piece counter table.</p> <p>As many cutting edges can be noted for the workpiece counter as are possible in total in the NCK.</p> <p>This means that if for each tool each cutting edge in each TO unit is used precisely once for a workpiece then the limit is reached.</p> <p>If several workpieces are made on several toolholders/spindles simultaneously, it is possible to note MD18100 \$MN_MM_NUM_CUTTING_EDGES_IN_TOA cutting edges for the workpiece counter for all of the workpieces.</p> <p>If this alarm occurs, it means that cutting edges used subsequently are no longer quantity monitored until the table has been emptied again, e.g. by means of the NC language command SETPIECE or by the relevant job from HMI, PLC (PI service).</p> |
| <b>Reaction:</b>              | <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**6433 [Channel %1: ] Block %2 %3 not available with tool management**

|                                   |                                                                                                                                       |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>                | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source symbol                                                                 |
| <b>Explanation:</b>               | The system variable specified in %3 is not available with active tool management. The function GELSELT should be used with \$P_TOOLP. |
| <b>Reaction:</b>                  | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                 |
| <b>Remedy:</b>                    | Modify program. If \$P_TOOLP has been programmed, the GETSELT function should be used instead.                                        |
| <b>Programm<br/>continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                  |

---

**6434 [Channel %1: ] Block %2 NC command SETMTH not allowed because tool holder function not active**

|                                   |                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>                | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                         |
| <b>Explanation:</b>               | No master toolholder has been defined for the initial state (MD20124 \$MC_TOOL_MANAGEMENT_TOOLHOLDER = 0), therefore no toolholder is available. The NC command SETMTH has neither been defined. In this setting, the tool change is carried out referring to the master spindle. The master spindle is set with SETMS. |
| <b>Reaction:</b>                  | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                               |
| <b>Remedy:</b>                    | Correct the NC program (delete or replace SETMHT) or enable toolholder function via machine data.                                                                                                                                                                                                                       |
| <b>Programm<br/>continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                        |

---

**6436 [Channel %1: ] Block %2 command '%3' cannot be programmed. Function '%4' has not been activated.**

|                     |                                                                                                                                                                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label<br>%3 = Programmed command<br>%4 = Function identifier                                                                                                                                             |
| <b>Explanation:</b> | The command cannot be programmed due to the lack of a function enable or activation.<br>Function code (4th parameter):<br>1 = Flat D numbers<br>2 = Tool monitoring<br>3 = Magazine management<br>4 = Multitools<br>5 = T=Magazine location number |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                   |

**Remedy:** Correct the NC program  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**6437 [Channel %1: ] Block %2 Command '%3' cannot be programmed. Function '%4' is activated.**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Programmed command  
 %4 = Function identifier

**Explanation:** The command cannot be programmed as the specified function is active.  
 Function code (4th parameter):  
 1 = Flat D numbers  
 2 = Tool monitoring  
 3 = Magazine management  
 4 = Multitools  
 5 = T=Magazine location number

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Correct the NC program  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**6438 [Channel %1: ] Block %2 inconsistent data modification is not permitted.**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** In a defined multitool, for example, the distance coding \$TC\_MTP\_KD cannot be changed once the multitool location has been generated.

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Correct the NC program  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**6441 Writing of \$P\_USEKT not allowed.**

**Explanation:** An attempt was made to write the value of \$P\_USEKT. This is not possible since programming T='location number' with automatic setting of \$P\_USEKT is active.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** - Check how the NC is supposed to be configured. (See bit16 and bit22 in MD 20310 \$MC\_TOOL\_MANAGEMENT\_MASK).  
 - Is a part program being used that is intended for an NC control without T='location number' with automatic setting of \$P\_USEKT? This program cannot be started on an NC control with T='location number' with automatic setting of \$P\_USEKT.  
 - Either run the part program on an appropriate NC control or edit the part program.

**Programm continuation:** Clear alarm with the Delete key or NC START.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>6442</b>                   | <b>[Channel %1: ] Function not executable. No tool assigned to desired magazine/magazine location %2.</b>                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters:</b>            | %1 = Channel ID<br>%2 = Magazine/magazine location no.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Explanation:</b>           | PLC logic is presumably incorrect. Tool change with reject tool is configured. Preparatory command is pending. Selected tool is (e.g. from PLC) unloaded from its location. PLC acknowledges preparatory command with 'Repeat tool selection' (e.g. status =7). NCK cannot find the tool at the magazine location specified in the PLC command.<br>Or: Illegal operator intervention in an active tool selection (unloading of the tool to be selected) has occurred. Therefore the PLC acknowledgment fails.         |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Remedy:</b>                | PLC programmer must note the following:<br>- Ensure that the tool is not removed from the specified magazine location (e.g. incorrect PLC program).<br>- Do not remove the tool from the programmed tool change before the final acknowledgment of the command (= unload).<br>!! It is however permissible to change the location of the tool to be loaded. The NCK can deal with this situation.<br>This alarm supplements Alarm 6405, if it contains the identifier 8. Therefore, the diagnostics should be easier. |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>6450</b>                   | <b>[Channel %1: ] Block %2 tool change not possible. Invalid magazine location no. %3 in buffer magazine</b>                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters:</b>            | %1 = Channel ID<br>%2 = Block number, label<br>%3 = Magazine location number                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Explanation:</b>           | The desired tool change is not possible. The specified magazine location is either toolholder/spindle or empty.<br>Only the numbers of the buffer that are not toolholder/spindle may be programmed with the NC command TCI, i.e. the location number of a gripper is allowed.                                                                                                                                                                                                                                        |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | - Check whether the magazine data (\$TC_MPP1) have been defined correctly.<br>- Check whether the alarm-causing program command _ e.g. TCI _ has been programmed correctly.                                                                                                                                                                                                                                                                                                                                           |

| <b>6454</b>                   | <b>[Channel %1: ] Block %2 tool change not possible. No distance relation available.</b>                                                                                    |
| <b>Parameters:</b>            | %1 = Channel ID<br>%2 = Block number, label                                                                                                                                 |
| <b>Explanation:</b>           | The desired tool change is not possible. Neither the spindle nor the buffer magazine location have a distance relation.                                                     |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                            |
| <b>Remedy:</b>                | - Check whether the magazine data (\$TC_MDP2) have been defined correctly.<br>- Check whether the alarm-causing program command _ e.g. TCI _ has been programmed correctly. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                            |

|                     |                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>6455</b>         | <b>[Channel %1: ] Block %2 tool change not possible. Magazine location no. %3 not available in magazine %4</b>       |
| <b>Parameters:</b>  | %1 = Channel ID<br>%2 = Block number, label<br>%3 = Magazine location number<br>%4 = Magazine number                 |
| <b>Explanation:</b> | The desired tool change is not possible. The indicated magazine location is not available in the indicated magazine. |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                     |

**Remedy:** - Check whether the causing program command - e.g. TCI - has been parameterized correctly.  
- Check whether magazine data have been defined correctly. (\$TC\_MAP6 and \$TC\_MAP7 of the intermediate location magazine)

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**6460 [Channel %1: ] Block %2 Command '%3' can only be programmed for tools. '%4' does not designate a tool.**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Programmed command  
%4 = Programmed parameter

**Explanation:** The specified command can only be programmed for tools. The command parameter is not a T number or a tool name. If a multitool has been programmed: The command cannot be programmed for multitools.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the NC program

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**6462 [Channel %1: ] Block %2 Command '%3' can only be programmed for magazines. '%4' does not designate a magazine.**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Programmed command  
%4 = Programmed parameter

**Explanation:** The specified command can only be programmed for magazines. The command parameter is not a magazine number or a magazine name. If a multitool has been programmed: The command cannot be programmed for multitools.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the NC program

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**6500 NC memory full**

**Explanation:** The NCK file system is full.  
The available buffered memory does not suffice. Note: At first commissioning, files of the NC file system may be affected such as drive data, HMI files, FIFO files, NC programs...

**Reaction:** Alarm display.

**Remedy:** You have the following possibilities of eliminating the error:  
Adjust the size of the buffered memory with MD18230 \$MN\_MM\_USER\_MEM\_BUFFERED.  
Increase the space available in the buffered memory, e.g. by unloading part programs that are no longer being used.  
Decrease the size of the ring buffer (see MD18230 \$MC\_RESU\_RING\_BUFFER\_SIZE).

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**6510 Too many part programs in the NC memory**

**Explanation:** The maximum number of possible files in the NC file system (part of the NC memory) has been reached. Note: During first commissioning, this can affect files from the NC file system, e.g. drive data, HMI files, FIFO files, NC programs, cycle programs, ...

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Remedy:</b>                | Inform the authorized personnel/service department.<br>You have the following possibilities of eliminating the error:<br>- Delete or unload files (e.g. part programs)<br>- Increase the number of files in the file system in MD18320 \$MN_MM_NUM_FILES_IN_FILESYSTEM or MD18321 MD_MAXNUM_SYSTEM_FILES_IN_FILESYSTEM.<br>- With the Siemens cycle storage, increase the number of files in the resource file. |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                    |

---

|                               |                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>6520</b>                   | <b>The value of the machine data %1%2 is too low</b>                                                                                                       |
| <b>Parameters:</b>            | %1 = String: MD identifier<br>%2 = If required, index: MD array                                                                                            |
| <b>Explanation:</b>           | MD18370 \$MN_MM_PROTOD_NUM_FILES specifies the number of protocol files for the protocol users. However, more protocol files are used than are configured. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                             |
| <b>Remedy:</b>                | Increase the number of protocol files in MD18370 \$MN_MM_PROTOD_NUM_FILES.                                                                                 |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                               |

---

|                               |                                                                                                                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>6540</b>                   | <b>Too many directories in the NC memory</b>                                                                                                                                                              |
| <b>Explanation:</b>           | The number of directories in the NC file system (part of the NC memory) has reached the maximum limit.                                                                                                    |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                            |
| <b>Remedy:</b>                | You have the following possibilities of eliminating the error:<br>- Delete or unload the directory (e.g. the workpiece)<br>- Increase the number of directories in MD18310 \$MN_MM_NUM_DIR_IN_FILESYSTEM. |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                              |

---

|                               |                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>6560</b>                   | <b>Data format not allowed</b>                                                                                                                                                                                                                                                                             |
| <b>Explanation:</b>           | An attempt was made to write impermissible data in an NCK file. This error can occur in particular when the attempt was made to load binary data in the NCK as ASCII file.<br>The error can also occur during preprocessing of cycles (see MD10700 \$MN_PREPROCESSING_LEVEL) if the NC block is very long. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | You have the following possibilities of eliminating the error:<br>Mark the file as binary data, e.g. with the extension: .BIN).<br>If the part program block is very long, split it up.                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                               |

---

|                               |                                                                                    |
|-------------------------------|------------------------------------------------------------------------------------|
| <b>6568</b>                   | <b>Limit of the extended CNC memory reached</b>                                    |
| <b>Explanation:</b>           | The memory space assigned to the function 'Extended CNC user memory' is exhausted. |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Alarm display.                                |
| <b>Remedy:</b>                | Delete files in the extended CNC memory                                            |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                           |

---

|                     |                                                                             |
|---------------------|-----------------------------------------------------------------------------|
| <b>6569</b>         | <b>HMI user memory limit reached on the memory card.</b>                    |
| <b>Explanation:</b> | The memory space in the reserved user area on the memory card is exhausted. |

**Reaction:** NC Start disable in this channel.  
Alarm display.

**Remedy:** Delete files on the memory card

**Programm continuation:** Switch control OFF - ON.

---

**6570 NC memory full**

**Explanation:** The DRAM file system of the NCK is full. The task cannot be executed. Too many system files were created in the DRAM.

**Reaction:** Alarm display.

**Remedy:** Start fewer "execute from external" processes.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**6581 NC user memory full**

**Explanation:** The DRAM file system of the user area is full. The order cannot be executed.

**Reaction:** Alarm display.

**Remedy:** Delete or unload files (e.g. part programs)

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**6582 NC machine OEM memory full**

**Explanation:** The DRAM file system of the machine OEM area is full. The order cannot be executed.

**Reaction:** Alarm display.

**Remedy:** Delete or unload files (e.g. part programs)

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**6583 NC system memory full**

**Explanation:** The DRAM file system of the system area (Siemens) is full. The order cannot be executed.

**Reaction:** Alarm display.

**Remedy:** Increase MD18354 \$MN\_MM\_S\_FILE\_MEM\_SIZE or, with Siemens cycles, increase the partition size in the cycle resource file.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**6584 NC memory limit TMP reached**

**Explanation:** The DRAM file system of the TMP (temporary) area is full. The job cannot be executed.

**Reaction:** Alarm display.

**Remedy:** Increase MD18351 \$MN\_MM\_DRAM\_FILE\_MEM\_SIZE or MD18355 \$MN\_MM\_T\_FILE\_MEM\_SIZE or switch off the precompilation of individual or all cycles or delete files in the TMP area.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**6693 File %1 lost**

**Parameters:** %1 = File name

**Explanation:** Due to a power failure, a file change could not be terminated properly. The file is lost.

**Reaction:** NC not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Import the file again.  
**Programm continuation:** Switch control OFF - ON.

---

#### 6694 **Drives could not be mounted**

**Explanation:** The external drives could not be mounted within the configured time (see MD10128 \$MN\_EES\_MAX\_MOUNT\_TIME).  
**Reaction:** NC not ready.  
Interface signals are set.  
Alarm display.  
**Remedy:** Check logdrives.ini and increase MD10128 \$MN\_EES\_MAX\_MOUNT\_TIME if necessary.  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

#### 6700 **[Channel %1: ] Value of the machine data %2%3 is too low**

**Parameters:** %1 = Channel number  
%2 = MD identifier  
%3 = If required, field index  
**Explanation:** The MD28302 \$MC\_MM\_PROTOK\_NUM\_ETP\_STD\_TYP specifies the number of default event types for the protocol users. However, more types are used than configured.  
**Reaction:** Alarm display.  
**Remedy:** Increase MD28302 \$MC\_MM\_PROTOK\_NUM\_ETP\_STD\_TYP.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

#### 6710 **Data loss with trace in the diagnostics operating area. The IPO cycle is too heavily loaded by the trace.**

**Explanation:** Data loss with trace in the diagnostics operating area. The IPO cycle is too heavily loaded by the trace, so data blocks have to be rejected. This should prevent the trace impairing production.  
The alarm can be suppressed with MD11415 \$MN\_SUPPRESS\_ALARM\_MASK2 bit 26.  
**Reaction:** Alarm display.  
**Remedy:** Select less data or lengthen the IPO cycle.  
The alarm can be suppressed with MD11415 \$MN\_SUPPRESS\_ALARM\_MASK2 bit 26.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

#### 6720 **Data loss with trace in the diagnostics operating area. Communication with the HMI is too heavily loaded by the trace.**

**Explanation:** Data loss with trace in the diagnostics operating area. Communication with the HMI is too heavily loaded by the trace, so data blocks have to be rejected. This should prevent the trace impairing production.  
The alarm can be suppressed with MD11415 \$MN\_SUPPRESS\_ALARM\_MASK2 bit 26.  
**Reaction:** Alarm display.  
**Remedy:** Select less data or reduce the sampling rate.  
The alarm can be suppressed with MD11415 \$MN\_SUPPRESS\_ALARM\_MASK2 bit 26.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

| <b>Parameters:</b>            | %1 = Block number<br>%2 = Programmed command<br>%3 = Current protection level of the command<br>%4 = Programmed protection level of the command                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | On assigning a protection level for a part program command via REDEF command<br>- an impermissible part program command has been programmed<br>- a protection level has been programmed that is logically smaller (larger in value) than the protection level currently applicable for this command.<br>- the relevant definition file has not been protected sufficiently against write access. The write protection of the file must be at least as high as the highest protection level that has been assigned to a part program command in this definition file. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Modify definition files /_N_DEF_DIR/_N_MACCESS_DEF or /_N_DEF_DIR/_N_UACCESS_DEF-CESS_DEF. Please see the Siemens Programming Guide or the OEM documentation for the language commands permissible for the relevant system configurations.                                                                                                                                                                                                                                                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>8010</b>                   | <b>Option 'activation of more than %1 axes' not set</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Parameters:</b>            | %1 = Number of axes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | More machine axes have been defined through the MD20070 \$MC_AXCONF_MACHAX_USED than are allowed in the system.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Reaction:</b>              | NC not ready.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                     |

**Remedy:** Please inform the authorised personnel/service department.  
 The sum of all axes that have been configured using the channel-specific MD20070 \$MC\_AXCONF\_MACHAX\_USED must not exceed the maximum number of axes.  
 Reduce the number of active axes or enable additional axes via option.  
 Please also observe the information relating to the definition of 'auxiliary axes/spindles', 'simulation axes', and 'virtual axis for master value coupling with curve table'.

**Programm continuation:** Switch control OFF - ON.

## **8012 The 'Activation of more than %1 SI axes' option is not set**

**Parameters:** %1 = Number of licensed axes  
 %2 = Number of axes with active dbSi

**Explanation:** The drive-based safety functions were activated for more axes than permitted in the system.

**Reaction:** NC not ready.  
 Mode group not ready, also effective for single axes.  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.

**Remedy:** Please notify the authorized personnel / service department. Reduce the number of axes activated with drive-based safety functions or release additional axes in the option date.

**Programm continuation:** Switch control OFF - ON.

## **8020 Option 'activation of more than %1 channels' not set**

**Parameters:** %1 = Number of active channels

**Explanation:** More than the permissible number of channels have been activated.

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Please inform the authorized personnel/service department.  
 In the system-specific MD10010 \$MN\_ASSIGN\_CHAN\_TO\_MODE\_GROUP, reduce the number of active channels or enable additional channels via option.

**Programm continuation:** Switch control OFF - ON.

## **8021 Option 'activation of more than %1 mode groups' not set**

**Parameters:** %1 = Number of mode groups

**Explanation:** The option for the number of mode groups is not compatible with the activated mode group.

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** You have the following possibilities of eliminating the error:  
 Retrofit the option for more mode groups.  
 Activate fewer mode groups.

**Programm continuation:** Switch control OFF - ON.

## **8022 The 'Activation of more than %1 handling channels' option is not set**

**Parameters:** %1 = Number of active handling channels

|                               |                                                                                                                                                                                                                                                                                    |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | More than the permissible number of handling channels have been activated by the channel-specific MD20010 \$MC_IS_ADD_CHAN.                                                                                                                                                        |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                  |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department.<br>In the system-specific MD10010 \$MN_ASSIGN_CHAN_TO_MODE_GROUP or in the channel-specific MD20010 \$MC_IS_ADD_CHAN, reduce the number of active handling channels or enable additional handling channels with option. |

| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                               |

---

|                    |                                         |
|--------------------|-----------------------------------------|
| <b>8027</b>        | <b>'%1&lt;OPTNX&gt;' option not set</b> |
| <b>Parameters:</b> | %1 = Brief description of option        |

**Explanation:** The option for the 'Grinding Advanced' functionality is not set.

**Reaction:** NC Start disable in this channel.

Alarm display.

**Remedy:** Please contact the authorized personnel/Service.

- Buy option

- Deactivate the 'Grinding Advanced' functionality

- 'Grinding Advanced' functional scope:

Cylinder error compensation

**Programm continuation:** Switch control OFF - ON.

---

### 8028 Axis %1: '%2<OPTNX>' option not set

**Parameters:** %1 = Axis

**Explanation:** The option for 'pitch compensation' functionality is not set

**Reaction:** NC Start disable in this channel.

Alarm display.

**Remedy:** Please inform the authorized personnel/service department.

- Purchase option

- Reset the activation of the 'pitch compensation' functionality (MD37310 \$MA\_NOCO\_INPUT\_AX\_1, MD37320 \$MA\_NOCO\_INPUT\_AX\_2, MD37330 \$MA\_NOCO\_INPUT\_AX\_3)

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

### 8029 [Channel %1: ] Block %2 Collision avoidance requires too many channels. %3 are required, %4 are configured.

**Parameters:** %1 = Channel number

%2 = Block number, label

%3 = Number of required channels

%4 = Number of configured channels

**Explanation:** The collision model uses more channels than covered by the option.

The maximum number of collision-relevant channels is configured in the option data OD19840

\$ON\_NUM\_CHANNELS\_CA\_STL or OD19841 \$ON\_NUM\_CHANNELS\_CA\_PRIMITIVES.

**Reaction:** Alarm display.

**Remedy:** Please notify authorized personnel/service.

- Purchase additional channel options for collision avoidance

- Reduce collision model to fewer channels

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

### 8030 [Channel %1: ] Block %2 option 'interpolation of more than %3 axes' not set

**Parameters:** %1 = Channel number

%2 = Block number, label

%3 = Number of permissible axes

**Explanation:** The number of axes programmed in the interpolating group exceeds the permissible number of interpolating axes.

**Reaction:** Interpreter stop

NC Start disable in this channel.

Interface signals are set.

Alarm display.

**Remedy:** In the part program, program as many axes as are permitted by the configuration of the controller or enable additional axes via option.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**8031 [Channel %1: ] Block %2 axis %3: Axis has no IPO functionality**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis, spindle number

**Explanation:** An axis/spindle that has been defined as a special axis/auxiliary spindle (see MD30460 \$MA\_BASE\_FUNCTION\_MASK bit8), should be operated as an interpolating axis.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Define axis as interpolating axis (see MD30460 \$MA\_BASE\_FUNCTION\_MASK bit8) or change part program

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**8032 [Collision avoidance requires too many channels. %1 are required, %2 are configured.]**

**Parameters:** %1 = Number of required channels  
%2 = Number of configured channels

**Explanation:** The preview uses more channels than configured in the option data OD19842 \$ON\_NUM\_CHANNELS\_CA\_OPEN.

**Reaction:** Alarm display.

**Remedy:** Please notify the authorized personnel/service.  
- Buy additional channel options for collision avoidance  
- Reduce the preview to fewer channels

**Programm continuation:** Switch control OFF - ON.

---

**8037 Axis %1: APC option '%2<OPTNX>' is not set**

**Parameters:** %1 = Axis  
%2 = Option ID

**Explanation:** More than six current setpoint filters were activated in the drive, although the corresponding option had not been set.

**Reaction:** NC not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** - Buy option  
- Deactivate the 'Advanced Positioning Control' (APC) function in the drive.  
- Set a maximum of six current setpoint filters in the drive.

**Programm continuation:** Switch control OFF - ON.

---

**8040 Machine data %1 reset, corresponding option is not set**

**Parameters:** %1 = String: MD identifier

**Explanation:** A machine data has been set that is locked by an option.

**Reaction:** Alarm display.

**Remedy:** Please inform the authorized personnel/service department.  
For retrofitting the option, please refer to your machine manufacturer or to a sales representative of SIEMENS AG, A&D MC.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 8041 Axis %1: MD %2, corresponding option not sufficient

**Parameters:** %1 = Axis number  
%2 = String: MD identifier

**Explanation:** The number of axes specified in the associated option data has been exceeded.  
More axes have been selected in the corresponding machine data than are permitted by the function associated with the option.

The alarm can be reconfigured in MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY to "Channel not ready".

**Reaction:** Mode group not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.  
Channel not ready.

**Remedy:** Inform the authorized personnel/service department.  
- Increase the option data  
- Reduce the number of axes

**Programm continuation:** Switch control OFF - ON.

---

### 8042 Option '%1<OPTNX>' is not set

**Parameters:** %1 = Brief description of option

**Explanation:** Please inform the authorized personnel/service department.  
A non-released option was used  
The stated option or an equivalent one is required to execute the action.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Terminate action, upgrade option.  
Please compare the available option data and/or (if available) the license image of your controller

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 8043 '%1<OPTNX>' option not set

**Parameters:** %1 = Brief description of option

**Explanation:** A non-released option was used  
The stated option or an equivalent one is required for execution of the action.

**Reaction:** NC Start disable in this channel.  
Channel not ready.  
Alarm display.

**Remedy:** Please inform the authorized personnel/service department.  
Stop action. Retrofit option.  
-Please compare the available option data and/or (if available) the license image of your control

**Programm continuation:** Switch control OFF - ON.

---

### 8045 'Activation drive integrated ESR' option not set

**Explanation:** 'Extended stop and retract (ESR)' was activated in the drive, although the corresponding option was not set.

|                               |                                                                                                                                               |

**Remedy:** Please notify the authorized personnel/service.

- Reset drive option
- Purchase option

**Programm continuation:** Switch control OFF - ON.

### 8053 Drive: Option %1 is unknown

**Parameters:** %1 = Drive, option ID

**Explanation:** Drive option is unknown

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please notify the authorized personnel/service.

- Reset drive option

**Programm continuation:** Switch control OFF - ON.

### 8055 Error when initializing handling channels: Cause %1, Additional info 1 %2 (Additional info 2 %3)

**Parameters:** %1 = Cause  
%2 = Additional information  
%3 = Additional information

**Explanation:** An error occurred during configuration of handling channels. This may be due to one of the following causes:

- 1 - More axes than allowed have been assigned to both a machining and a handling channel by MD20070 \$MC\_AXCONF\_MACHAX\_USED. Additional info1 contains the number of axes affected, additional info2 the maximum number allowed.
- 2 - In connection with the activation of handling channels, the permissible number of active axes in the system was exceeded. Additional info1 contains the maximum number of axes that can be activated.
- 3 - A channel was declared as a handling channel and more than the permissible number of axes for it were activated. Additional info1 contains the channel number, additional info2 contains the maximum permissible number of axes.
- 4 - A channel was declared as a handling channel and more than the permissible number of spindles were activated for it. Additional info1 contains the channel number, additional info2 contains the maximum permissible number of spindles.
- 5 - The total number of permissible axes was exceeded in the machining channels. Additional info1 contains the maximum total number of axes that can be declared over all machining channels.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please inform the authorized personnel/service department.

- 1 - In the channel-specific MD20010 \$MC\_IS\_ADD\_CHAN, define the channel as a machining channel or remove the corresponding axis from one of the two channels.
- 2 - In the channel-specific MD20070 \$MC\_AXCONF\_MACHAX\_USED, deactivate axes or enable additional handling channels with option.
- 3 - In the channel-specific MD20010 \$MC\_IS\_ADD\_CHAN, define the channel as a machining channel or reduce the number of active axes in the channel.
- 4 - In the channel-specific MD20010 \$MC\_IS\_ADD\_CHAN, define the channel as a machining channel or reduce the number of active spindles in the channel.
- 5 - In the channel-specific MD20070 \$MC\_AXCONF\_MACHAX\_USED, deactivate axes in the respective channels.

**Programm continuation:** Switch control OFF - ON.

### 8060 CNC lock function: The request cannot be processed: cause %1

**Parameters:** %1 = Cause

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                     |                                                                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>8066</b>         | <b>CNC lock function: Changing the date has reduced the length of the remaining runtime.</b>                                                       |
| <b>Explanation:</b> | Activating the CNC lock function has brought forward the date of the control. This has reduced the length of time before the lock date is reached. |

**Reaction:** Alarm display.  
**Remedy:** The date of the control can be reset before switching off/on.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**8067 CNC lock function: A system alarm has occurred: cause %1**

**Parameters:** %1 = Cause  
**Explanation:** The CNC lock function has found problems:  
1 - Internal interface 1  
X - Internal interface X  
**Reaction:** NC not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.  
**Remedy:** If you experience such a system error, please contact Technical Support.  
[www.siemens.com/sinumerik/help](http://www.siemens.com/sinumerik/help)  
Please supply the following information to ensure quick processing:  
- Alarm number together with alarm text  
- Description of the operation/mode before the alarm message  
- Generate log files using the key combination: <Ctrl> + <Alt> + <D>  
**Programm continuation:** Switch control OFF - ON.

---

**8080 %1 option(s) is/are activated without setting the license key**

**Parameters:** %1 = Number of non-licensed options  
**Explanation:** One or more options were activated but no license key was set to prove the purchase of the option(s).  
**Reaction:** Alarm display.  
**Remedy:** Generate a license key on the internet at <http://www.siemens.com/automation/license> and enter it in the operating area "Setup", function (HSK) "Licenses".  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**8081 %1 option(s) is/are activated that are not licensed by the license key**

**Parameters:** %1 = Number of non-licensed options  
**Explanation:** One or more options were activated, that are not licensed by the license key entered.  
**Reaction:** Alarm display.  
**Remedy:** Generate a new license key on the internet at <http://www.siemens.com/automation/license> and enter it in the operating area "Setup", function (HSK) "Licenses"..  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**8082 A wrong license key was entered three times, Power On required before next try.**

**Explanation:** The license key was entered wrongly at least three times. Before the next input, a new power ON is required.  
**Reaction:** Alarm display.  
**Remedy:** Execute NCK Power On and enter the license key (correctly).  
**Programm continuation:** Clear alarm with the Delete key or NC START.

| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Remedy:** Generate a new license key through the Internet at <http://www.siemens.com/automation/license> and enter in the operating area "Startup", function (HSK) "Licenses".  
Enter a valid license key in the operating area "Startup", function (HSK) "Licenses".

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**8089      The function 'Select tool offsets' is not possible**

**Explanation:** The current options do not permit a tool offset.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Disable tools offsets or  
reset option packages that include the tool offset as a reduced function.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**8090      CNC lock function: No license available**

**Explanation:** The CNC lock function is not licensed.  
A test license is not acceptable.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Generate a new license key on the internet at <http://www.siemens.com/automation/license> and enter it in the operating area "Setup", function (HSK) "Licenses"..

**Programm continuation:** Switch control OFF - ON.

---

**8100      [Channel %1: ] Block %2: function not possible**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** - Impossible due to embargo regulations:  
- 1. Synchronized actions: Writing of feedrate, override and axial offsets (\$AA\_VC, \$AC\_VC, \$AA\_OVR, \$AA\_VC and \$AA\_OFF) from synchronized actions as well as Continuous Dressing can be programmed only once in a block.  
- 2. Extended measurement: The "Cyclic measurement" (MEAC) and "Measurement from synchronized action" are not possible.  
- 3. Axis interpolation: The number of axes interpolating with one another must not exceed 4. This also includes synchronized coupling of axes via synchronized actions "DO POS[X]=\$A..." "DO FA[X]=\$A...".

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Modify the part program.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**8101      [Channel %1: ] Block %2 Function %3 Option '%4<OPTNX>' is not set**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Funktionsname  
%4 = Brief description of option

|                               |                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The option stage is not set for the desired function.                                                                                                            |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                            |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department.<br>- Buy option<br>- Activate the collision avoidance functionality (set MD19830 \$ON_COLLISION_MASK) |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                             |

## 8102 [Channel %1: ] Block %2 motion synchronous action: %3 function not possible

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, line number<br>%3 = Synact ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Explanation:</b>           | - Impossible due to embargo regulations:<br>- 1. Synchronous actions: Writing of feed, override and axial offsets (\$AA_VC, \$AC_VC, \$AA_OVR, \$AA_VC and \$AA_OFF) from synchronous actions as well as Continuous Dressing can be programmed only once in a block.<br>- 2. Extended measurement: 'Cyclic measurement' (MEAC) and 'Measurement from synchronous action' is not possible.<br>- 3. Axis interpolation: The number of axes interpolating with one another must not exceed 4 (this also includes synchronous coupling of axes via synchronous actions "DO POS[X]=\$A..." "DO FA[X]=\$A..."). |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remedy:</b>                | Modify part program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 8122 [Channel %1: ] Block %2 Slave axis/spindle %3 Generic coupling option CP-STATIC required (type %4)

|                               |                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number<br>%3 = Slave axis<br>%4 = Option type                                                                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | The option level CP-STATIC is required for the required function. Possible reasons:<br>- More couplings of the option type were created than permissible.<br>- The functional scope of one or several couplings has not been released.<br>The generic coupling involved with the specified slave spindle is the following option type:<br>- 1: COUP with coupling factor  1:1  without superimposed motion |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | - Purchase an adequate option level (CP-STATIC).<br>- Reduce the number of simultaneously active couplings of the option type.<br>- Only use the function scope that has been released.                                                                                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                       |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Reaction:</b>    | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

- Remedy:**
- Purchase an adequate option level (CP-COMFORT).
  - Reduce the number of simultaneously active couplings of the option type.
  - Reduce the number of master axes per coupling.
  - Only use the functional scope that has been released.
  - No superimposed programming of synchronous spindles

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**8128 [Channel %1: ] Block %2 Slave axis/spindle %3 Generic coupling option CP-EXPERT required (type %4)**

**Parameters:**

- %1 = Channel number
- %2 = Block number
- %3 = Slave axis
- %4 = Option type

**Explanation:** For the required function, option level CP-EXPERT is required. Possible causes:

- More couplings of the option type less than or equal to the option type were created than permissible.
- For one or several couplings, the number permissible master axes was exceeded.
- The functional scope of one or several couplings has not been released.
- Superimposing a synchronous spindle (coupling factor |1:1|) is not possible
- The curve table functionality (corresponds to option type 2) has not been released.

The generic coupling involved with the specified slave axis/spindle is the following option type:

- 0: TRAIL (in the BCS)
- 1: COUP with coupling factor |1:1| without superimposed motion
- 2: TRAIL and LEAD also in MCS, also mixed in synchronized actions, spindles and rotary axes, COUP
- 3: CP couplings (without curve tables) with up to 3 master axes, also mixed in synchronized actions, spindles and axes
- 4: CP couplings with up to 5 master axes, also possible mixed in synchronized actions, spindles and axes, cascades

**Reaction:**

Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

- Remedy:**
- Purchase an adequate option level (CP-EXPERT).
  - Reduce the number of simultaneously active couplings of the option type.
  - Reduce the number of master axes per coupling.
  - Only use the functional scope released.
  - No superimposed programming of synchronous spindles

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**8130 [Channel %1: ] Block %2 Slave axis/spindle %3 Generic coupling function not possible (type %4)**

**Parameters:**

- %1 = Channel number
- %2 = Block number
- %3 = Slave axis
- %4 = Option type

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Explanation:</b> | <p>NC start has been activated in the MDI or AUTOMATIC mode and at least one axis that needs to be referenced has not reached its reference point.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Reaction:</b>    | <p>Interface signals are set.<br/>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Remedy:</b>      | <p>Please inform the authorized personnel/service department. Via the channel-specific MD20700: \$MC_REFP_NC_START_LOCK (NC Start without reference point) you can decide whether or not the axis has to be referenced before NC Start. The start of referencing can be enabled channel-specific or axis-specific.</p> <p>Channel-specific reference point approach: The rising edge of the NC/PLC interface signal DB3200 DBX1.0 (Activate referencing) starts an automatic sequence which starts the axes of the channel in the same sequence as specified in the axis-specific MD34110 \$MA_REFP_CYCLE_NR (axis sequence channel-specific referencing). 0: The axis does not participate in channel-specific referencing, but it must be referenced for NC Start, -1: The axis does not participate in channel-specific referencing, but it need not be referenced for NC Start, 1- 8: Starting sequence for the channel-specific referencing (simultaneous start at the same no.), 1 - 31: CPU type</p> <p>Axis-specific referencing: Press the direction key that corresponds to the approach direction in the axis-specific MD34010 \$MA_REFP_CAM_MDIR_IS_MINUS (reference point approach in minus direction).</p> |

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

| <b>Explanation:</b>           | A specific user action is to be executed, which leads to a (possibly other) internal action, for which at least one axis that needs to be referenced has not reached its reference point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Please reference the axis that needs to be referenced.<br><br>If the user action as an internal action leads to an NC start, whether or not the axis has to be referenced before NC start can be decided via the channel-specific MD20700 \$MC_REFP_NC_START_LOCK (NC start without reference point). If the user action as internal actions leads to a user ASUB start, whether or not the axis has to be referenced before ASUB start can be decided via the channel-specific MD20115 \$MC_IGNORE_REFP_LOCK_ASUP (ASUB start without reference point). If the user action as internal actions leads to a Prog Event start, whether or not the axis has to be referenced before Prog Event start can be decided via the channel-specific MD20105 \$MC_PROG_EVENT_IGN_REFP_LOCK (Prog Event start without reference point).<br><br>Channel or axis-specific referencing can be triggered.<br><br>Please inform the authorized personnel/service department. Whether or not the axis has to be referenced before NC start can be determined via the channel-specific MD20700: \$MC_REFP_NC_START_LOCK (NC start without reference point).<br>Channel or axis-specific referencing can be triggered.<br><br>Channel-specific reference point approach: The rising edge of the NC/PLC interface signal DB3200 DBX1.0 (activate referencing) starts an automatic sequence, which starts the axes of the channel in the same sequence as specified in the axis-specific MD34110 \$MA_REFP_CYCLE_NR (axis sequence channel-specific referencing). 0: The axis does not participate in channel-specific referencing, but it must be referenced for NC start, -1: The axis does not participate in channel-specific referencing, but it need not be referenced for NC start, 1- 8: Starting sequence for the channel-specific referencing (simultaneous start at the same no.), 1- 31: CPU type<br><br>Axis-specific referencing: Press the direction key that corresponds to the approach direction in the axis-specific MD34010 \$MA_REFP_CAM_MDIR_IS_MINUS (reference point approach in minus direction). |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                               |                                                                                                                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>10208</b>                  | <b>[Channel %1: ] Continue program with NC start</b>                                                                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number                                                                                                                                                                       |
| <b>Explanation:</b>           | After block search with calculation, the control is in the desired state. The program can now be started with NC Start or the state can be changed for the time being with overstore/jog. |
| <b>Reaction:</b>              | Interpreter stop<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                   |
| <b>Remedy:</b>                | Press NC Start.                                                                                                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                          |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>10209</b>        | <b>[Channel %1: ] Internal NC stop after block search</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters:</b>  | %1 = Channel number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b> | Internal alarm which only initiates the alarm response NC Stop.<br>The alarm is output in the following situations:<br>- If MD11450 \$MN_SEARCH_RUN_MODE, bit 0 ==1 and the last action block is loaded in the main run after block search. Alarm 10208 is then activated as a function of the NC/PLC interface signal DB3200 DBX1.6 (PLC action finished).<br>- Search alarm 10208 has been suppressed by the PI service _N_FINDBL (third decade of the parameter supplied with "2"). Alarm 10209 is set as a function of whether or not a search ASUB has been configured (MD11450 \$MN_SEARCH_RUN_MODE bit 1) with the end of the search ASUB or the loading of the last action block in the main run. |

**Reaction:** Interpreter stop  
NC Stop on alarm.

**Remedy:** Continue the program with NC start.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**10222 [Channel %1: ] Inter-channel communication not possible**

**Parameters:** %1 = Channel number

**Explanation:** This channel has received a negative acknowledgment from the inter-channel communication because the destination channel number is not known, e.g.: START(x) or WAITE(x) but channel x has not been initialized

**Reaction:** Alarm display.

**Remedy:** This is an indication of possible discrepancies. The program continues if no acknowledgment is called for.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**10223 [Channel %1: ] Command %2 is already occupied**

**Parameters:** %1 = Channel number  
%2 = Event name

**Explanation:** This channel has received a negative acknowledgment from the inter-channel communication because this command is already active or has not yet been terminated, e.g.: INIT(x,"ncprog") but a program select request is already active for channel x.

**Reaction:** Alarm display.

**Remedy:** This is an indication of possible discrepancies. The program continues if no acknowledgment is called for.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**10225 [Channel %1: ] command denied**

**Parameters:** %1 = Channel number

**Explanation:** The channel has received a command that cannot be executed.

**Reaction:** Alarm display.

**Remedy:** Press RESET.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**10226 [Channel %1: ] Reset/program end canceled**

**Parameters:** %1 = Channel number

**Explanation:** An error occurred during reset or program end, so that the channel cannot be switched to a ready state.  
This can occur, for example, if the interpreter reports an error during the processing of the init. blocks created during reset and program end.  
As a rule, further alarms indicate the exact problem.

**Reaction:** NC Start disable in this channel.  
Channel not ready.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Rectify the problem indicated by the other alarms, and press RESET again.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**10299 [Channel %1: ] Auto-Repos function is not enabled**

**Parameters:** %1 = Channel number

|                               |                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The Auto-Repos function (operating mode) was selected in the channel but is not implemented. |
| <b>Reaction:</b>              | Alarm display.                                                                               |
| <b>Remedy:</b>                | This message is purely informational.                                                        |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                 |

### 10605 [Channel %1: ] Block %2 thread pitch decrease too high

|                               |                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                           |
| <b>Explanation:</b>           | The thread pitch decrease is causing an axis standstill in the thread block.                              |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Reduce the thread pitch decrease or path length in the part program.                                      |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                          |

---

**10610 [Channel %1: ] Axis %2 not stopped**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** An axis/spindle has been positioned over several NC blocks using the POSA/SPOSA instruction. The programmed target position had not yet been reached ("exact stop fine" window) when the axis/spindle was reprogrammed.

Example:

```
N100 POSA[U]=100
```

```
:
```

```
N125 X... Y... U... ; e.g.: U axis still travels from N100!
```

**Reaction:** NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm.

**Remedy:** Check and correct the part program (analyze whether motion beyond block boundaries is appropriate here). Prevent block change by means of the keyword WAITP for axes or WAITS for spindles until the positioning axes or positioning spindles have also reached their target position.

Example for axes:

```
N100 POSA[U]=100
```

```
:
```

```
N125 WAITP(U)
```

```
N130 X... Y... U...
```

Example for spindles:

```
N100 SPOSA[2]=77
```

```
:
```

```
N125 WAITS(2)
```

```
N130 M6
```

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**10620 [Channel %1: ] Block %3 axis %2 at software limit switch %4**

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number  
%3 = Block number, label  
%4 = String

**Explanation:** During the traversing motion, the system detected that the software limit switch would be traversed in the direction indicated. Exceeding the traversing range was not detected during block preparation because there has either been a motion overlay or a work offset has been executed or a coordinate transformation is active.

**Reaction:** Local alarm reaction.

NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm at block end.

**Remedy:** Depending on the reason for this alarm being triggered, the following remedial measures should be undertaken:

- Handwheel override: Cancel the motion overlay and avoid this or keep it smaller when the program is repeated.

- Transformation: Check the preset/programmed work offsets (current frame). If the values are correct, the tool holder (fixture) must be moved in order to avoid triggering the same alarm when the program is repeated, which would again cause the program to be canceled.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>10625</b>                  | <b>[Channel %1: ] Block %3 Slave axis/spindle %2 with CP-SW limit stop %4</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number<br>%3 = Block number, label<br>%4 = String                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Explanation:</b>           | The slave axis/spindle was stopped because there is a risk that the software limit switch will be passed in the displayed direction. Depending on MD30455 \$MA_MISC_FUNCTION_MASK, bit 11 and CPMBRAKE, it is possible that also the complete coupling group was braked in the specific direction.                                                                                                                                                                                                                                                                                                 |
| <b>Reaction:</b>              | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Remedy:** Depending on the reason for this alarm being triggered, the following remedial measures should be undertaken:

- Handwheel override: Cancel the motion overlay and avoid this or keep it smaller when the program is repeated.
- Transformation: Check the preset/programmed work offsets (current frame). If the values are correct, the tool holder (fixture) must be moved in order to avoid triggering the same alarm when the program is repeated, which would again cause the program to be canceled.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**10630 [Channel %1: ] Block %2 axis %3 at working area limit %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis, spindle number  
%4 = String (+ or -)

**Explanation:** The specified axis violates the working area limitation. This is recognized only in the main run either because the minimum axis values could not be measured before the transformation or because there is a motion overlay.

**Reaction:** Local alarm reaction.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm at block end.

**Remedy:** Program other motion or do not perform overlaid motion.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**10631 [Channel %1: ] Axis %2 rests at working area limit %3%4**

**Parameters:** %1 = Channel number  
%2 = Axis, spindle  
%3 = String (+ or -)  
%4 = The axis of the working area limitation is only output if different from the traversing axis.

**Explanation:** The specified axis reaches the working area limitation in JOG mode.

**Reaction:** Alarm display.

**Remedy:** Check SD43420 \$SA\_WORKAREA\_LIMIT\_PLUS and SD43430 \$SA\_WORKAREA\_LIMIT\_MINUS for the working area limitation.  
**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**10632 [Channel %1: ] Block %2 axis %3 reaches the coordinate system-specific working area limit %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis, spindle number  
%4 = String (+ or -)

**Explanation:** The specified axis violates the coordinate system-specific working area limitation. This is not detected until the main run, either because the minimum axis values could not be determined before the transformation or because there is an overlaid movement.

**Reaction:** Local alarm reaction.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm at block end.

**Remedy:** Program other motion or do not perform overlaid motion.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

|                               |                                                                                                                                                                                                                                                                  |

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**10637 [Channel %1: ] Axis %2, tool radius compensation is inactive for type %3 working area limitation, reason: Tool not active.**

**Parameters:** %1 = Channel number  
%2 = Axis, spindle  
%3 = 0: BCS, 1: WCS / SZS

**Explanation:** The tool radius compensation of the working area limitation of the stated axis is not taken into account.  
Reason: No tool is active.  
The alarm is reported in JOG mode.

**Reaction:** Alarm display.

**Remedy:** The tool radius compensation for working area limitations in JOG mode cannot be taken into account without an active tool.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**10650 [Channel %1: ] Axis %2 incorrect gantry machine data, error code %3**

**Parameters:** %1 = Channel number  
%2 = Axis  
%3 = Error no.

**Explanation:** An incorrect value was entered in the gantry-specific axial machine data. Further information can be derived from the error number.

- Error no. = 1 => either an incorrect gantry unit has been entered or the designation of the following axis is incorrect.
- Error no. = 2 => master axis has been specified more than once.

**Reaction:** NC not ready.  
Mode group not ready, also effective for single axes.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Please inform the authorized personnel/service department. Correct the machine data:  
MD37100 \$MA\_GANTRY\_AXIS\_TYPE  
0: No gantry axis 1: Master axis grouping 1 11: Slave axis grouping 1 2: Master axis grouping 2 12: Slave axis grouping 2 3:  
Master axis grouping 3 13: Slave axis grouping 3

**Programm continuation:** Switch control OFF - ON.

---

**10651 [Channel %1: ] Gantry configuration error. Error code %2**

**Parameters:** %1 = Channel number  
%2 = Reason

| <b>Remedy:</b>      | <ul style="list-style-type: none"><li>a) Check NC program for correct positional data and, if necessary, make corrections.</li><li>b) Check work offsets (current frame)</li><li>c) Correct working area limitation via G25/G26, or</li><li>d) Correct working area limitation via setting data, or</li><li>e) Deactivate working area limitation via setting data 43410 WORKAREA_MINUS_ENABLE=FALSE</li></ul>                                                                                             |

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 10731 [Channel %1: ] Block %3 axis %2 working area limitation %4

**Parameters:** %1 = Channel number  
 %2 = Axis name, spindle number  
 %3 = Block number, label  
 %4 = String ( + or - )

**Explanation:** The motion planned for the axis violates the currently active working area limit.  
 The alarm is activated during the preparation of approach or rest blocks for REPOS.  
 This alarm is issued instead of alarm 10733 if bit 11 is not set in MD11411 \$MN\_ENABLE\_ALARM\_MASK.

**Reaction:** Local alarm reaction.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Determine the cause of the offset from the initial or target position. The REPOS command is executed at the end of an ASUB or system ASUB. See also cross reference from ASUBs.  
 Check the currently active work offset via the current frame.  
 Also check the external work offsets, overlaid movements (\$AA\_OFF), DRF and transformation components.  
 Cancel NC program with NC reset.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

### 10732 [Channel %1: ] Block %5 axis %2 working area limitation violated, residual distance: %6 %3<ALUN>

**Parameters:** %1 = Channel number  
 %2 = Axis name, spindle number  
 %3 = Unit of distance  
 %4 = Block number, label|residual distance

**Explanation:** This alarm was triggered during the preparation of the displayed block.  
 Cause:  
 The programmed path violates the active working area limitation for the displayed axis.  
 Note:  
 Parameter 4 contains the descriptions of parameters 5 and 6 separated by the character "|".  
 - 5 = Block number, label  
 - 6 = Distance-to-go  
 Alarm 10732 is displayed for MD11411 \$MN\_ENABLE\_ALARM\_MASK, bit 11 == 1 instead of alarm 10730.  
 Alarm 10732 offers an expanded diagnostics option for the working area limitation violation.  
 Condition:  
 Alarm file ALUN\* is present in the HMI.  
 See also:  
 Diagnostics Manual for alarm 10730

**Reaction:** Correction block is reorganized.  
 Local alarm reaction.  
 Interface signals are set.  
 Alarm display.

**Remedy:** a) Check NC program for correct positional data and, if necessary, make corrections.  
 b) Check work offsets (current frame)  
 c) Correct working area limitation via G25/G26, or  
 d) Correct working area limitation via setting data, or  
 e) Deactivate working area limitation via SD43410 \$SA\_WORKAREA\_MINUS\_ENABLE=FALSE

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Explanation:</b>           | Possible causes:<br>In a WAB block, the parameter DISR has not been specified or its value is less than or equal to 0.<br>During approach or retraction with circle and active tool radius, the radius of the internally generated - WAB contour is negative. The internally generated WAB contour is a circle with a radius which, when offset with the current offset radius (sum of tool radius and offset value OFFN), yields the tool center point path with the programmed radius DISR. |

#### 10747 [Channel %1: ] Block %2 retraction direction not defined for WAB

|                     |                                                                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                           |
| <b>Explanation:</b> | In a WAB retraction block with quarter circle or semi-circle (G248 or G348), the end point in the machining plane was not programmed, and either G143 or G140 without tool radius compensation is active. |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                                                                                                                                                                                                                                                                  |
| <b>Remedy:</b>                | Modify the part program. You can make the following changes: <ul style="list-style-type: none"><li>- Specify the end point in the machining plane in the WAB block.</li><li>- Activate the tool radius compensation (effective for G140 only, not for G143).</li><li>- Specify the retraction side explicitly with G141 or G142.</li><li>- Use a straight line instead of a circle for retraction.</li></ul> |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                             |

**10751 [Channel %1: ] Block %2 danger of collision due to tool radius compensation**

|                     |                                                                                                                                                                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                          |
| <b>Explanation:</b> | The "Bottleneck detection" (calculation of intersection for the following compensated traversing blocks) has not been able to calculate a point of intersection for the reviewed number of traversing blocks. It is therefore possible that one of the equidistant paths violates the workpiece contour. |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Local alarm reaction.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm at block end.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | <p>Please inform the authorized personnel/service department. Check the part program and, if possible, modify the programming so that inside corners with smaller paths than the correction value are avoided. (Outside corners are not critical because the equidistants are lengthened or intermediate blocks are inserted, so that there is always a point of intersection).</p> <p>Increase the number of reviewed traversing blocks via machine data MD20240 \$MC_CUTCOM_MAXNUM_CHECK_BLOCKS (default: 3), this increases the amount of computing capacity required and consequently also the block change time.</p> <p>Another possible remedy: program CDOF2 for 3D-WRK(CUT3DC), program CDOF for 2D-WRK.</p>                                                                                                                                                                                                                                                                                                         |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Explanation:</b>           | <p>The tool radius compensation must buffer a variable number of intermediate blocks in order to enable calculation of the equidistant tool path for each NC block. The size of the buffer cannot be determined by simple means. It depends on the number of blocks without traversing information in the compensation plane, the number of contour elements to be inserted and the shape of the curvature in spline and polynomial interpolation.</p> <p>The size of the buffer must not exceed the size of the system memory.</p> <p>Additional information about the error state</p> <p>Error code (3rd parameter).</p> <p>0 = Overrun of the local block buffer for tool radius compensation.</p> <p>1 = Local block buffer is presumably parameterized too large by the number of missing blocks (4th parameter).</p>                                                                                                                                                                                                   |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Local alarm reaction.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm at block end.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | <p>Please inform the authorized personnel/service department.</p> <p>Simplify NC program:</p> <ul style="list-style-type: none"> <li>- By avoiding: <ul style="list-style-type: none"> <li>Blocks without traversing information in the compensation plane</li> <li>Blocks with contour elements having a variable curvature (e.g. ellipses) and with curvature radii that are smaller than the compensation radius. (Such blocks are divided up into several subblocks).</li> </ul> </li> <li>- Increase the number of reviewed blocks for collision monitoring (MD20240 \$MC_CUTCOM_MAXNUM_CHECK_BLOCKS).</li> <li>- If (MD20240 \$MC_CUTCOM_MAXNUM_CHECK_BLOCKS) is increased, it must be ensured that the system memory is adequate. That means, if necessary, increasing the number of blocks in MD28070 \$MC_MM_NUM_BLOCKS_IN_PREP.</li> </ul> <p>Parameter 4 serves as an orientation value for the number of missing block locations. This value depends on the situation and has to be determined individually.</p> |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>10755</b>        | <b>[Channel %1: ] Block %2 selection of the tool radius compensation via KONT not possible at the current starting point</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Explanation:</b> | When activating the cutter radius compensation with KONT the starting point of the approach block is within the compensation circle and therefore already violates the contour.<br>If the cutter radius compensation is selected with G41/G42, the approach behavior (NORM or KONT) determines the compensation movement if the present actual position is behind the contour. With KONT, a circle is drawn with the cutter radius around the programmed initial point (= end point of the approach block). The tangent that passes through the present actual position and does not violate the contour is the approach movement.<br>If the start point is within the compensation circle around the target point, no tangent passes through this point. |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Remedy:</b>      | Place selection of the CRC such that the starting point of the approach movements comes to rest outside of the correction circle around the target point (programmed traversing movements > compensation radius). The following possibilities are available:<br>Selection in the previous block<br>Insert intermediate block<br>Select approach behavior NORM                                                                                                                                                                                                                                                                                                                                                                                             |

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**10756 [Channel %1: ] Block %2 deselection of the tool radius compensation via KONT not possible at the programmed end point**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** On deselection of the cutter radius compensation, the programmed end point is within the compensation circle. If this point were in fact to be approached without compensation, there would be a contour violation.  
If the cutter radius compensation is deselected via G40, the approach behavior (NORM or KONT) determines the compensation movement if the programmed end point is behind the contour. With KONT, a circle is drawn with the cutter radius about the last point at which the compensation is still active. The tangent passing through the programmed end position and not violating the contour is the retraction movement.  
If the start point is within the compensation circle around the target point, no tangent passes through this point.

**Reaction:** Correction block is reorganized.  
Local alarm reaction.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm at block end.

**Remedy:** Place deselection of the CRC such that the programmed end point comes to rest outside the compensation circle around the last active compensation point. The following possibilities are available:  
Deselection in the next block  
Insert intermediate block  
Select retract behavior NORM

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**10757 [Channel %1: ] Block %2 Impermissible change of orientation while tool radius compensation is active**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** An orientation change has been programmed which is not permissible with the active tool radius compensation type (G code of group 22, e.g. CUT2D or CUT2DF). As a rule, changes to the tool orientation are only permissible and useful if 3D tool radius compensation is active.  
An (impermissible) orientation change can also be triggered by a change of machining plane (G17 - G19).

**Reaction:** Correction block is reorganized.  
Local alarm reaction.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm at block end.

**Remedy:** Activate a G code from group 22 (e.g. CUT3DC), in which the programmed orientation change is permissible.  
Execute the program with constant tool orientation.  
If a plane change is necessary, first deactivate the tool radius compensation, and reactivate after the plane change.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**10758 [Channel %1: ] Block %2 curvature radius with variable compensation value too small**

**Parameters:** %1 = Channel number  
%2 = Block number, label

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>The current cutter radius compensation (the cutter used) is too large for the programmed path radius.</p> <p>In a block with variable tool radius compensation, a compensation must be possible either anywhere or nowhere on the contour with the smallest and the largest compensation value from the programmed range. There must be no point on the contour in which the curvature radius is within the variable compensation range.</p> <p>If the compensation value varies its sign within a block, both sides of the contour are checked, otherwise only the compensation side.</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Local alarm reaction.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm at block end.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Remedy:</b>                | <p>Use smaller cutters or allow for a part of the cutter radius at the time of contour programming.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Block number, label</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Explanation:</b>           | <p>In a block with spline or polynomial interpolation, the corrected path runs parallel to the tool orientation in at least one point, i.e. the path has a tangent perpendicular to the compensation plane.</p> <p>The tangent at a point on a path is regarded as parallel to the tool orientation if the angle between the two directions is less than the limit value defined by MD21080 \$MC_CUTCOM_PARALLEL_ORI_LIMIT.</p> <p>However, in circumferential milling, single straight lines running parallel to the tool orientation are permissible, as well as circles with a circle plane perpendicular to the compensation plane (application with smooth retraction from the groove). Also only individually, if the circle contains a point with a tangent parallel to the tool orientation.</p> <p>If a compressor (COMPCAD, COMPSURF) is active, the programmed straight lines (and possibly circles) are shown as non-linear polynomials, and that means a block with polynomial interpolation (see above).</p> <p>Straight lines in the direction of the tool orientation are not permissible in face milling (CUT3DF, CUT3DFS, CUT3DFF, CUT3DFD).</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Local alarm reaction.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm at block end.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | <p>Do not use splines or polynomials when writing the contour section, but straight lines and circles instead. Divide up the tool piece geometry and deselect the cutter radius compensation between the various sections.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Explanation:</b>           | When machining the inside of an ellipse, in parts of the ellipse the curvature radii are greater than or smaller than the cutter radius compensation.<br><br>In ellipses, in this case the block would be split up into 4 subblocks with curvature radii that are greater than and less than the compensation radius. Over several revolutions, there would be a tremendous increase in the amount of calculation required by the unlimited number of resulting subblocks, and therefore this situation is rejected by the error message.<br>If compensation is possible everywhere or nowhere on the ellipse, then ellipses are also permissible that cover more than one full revolution.                                                                  |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Remedy:</b>                | Use cutter with smaller radius or program motion block on blocks with no more than one revolution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Remedy:</b>                | - Modify part program<br>- Modify machine data<br>- Check whether SBL2 is activated. With SBL2, a block is generated from each part program line which can lead to exceeding the maximum permissible number of empty blocks between two traversing blocks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>10763</b>                  | <b>[Channel %1: ] Block %2 path component of the block in the compensation plane becomes zero</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Explanation:</b>           | Due to collision monitoring with active tool radius compensation, the path component of the block in the compensation plane becomes zero. If the original block contains no motion information perpendicular to the compensation plane, it means that this block is excluded.<br><br>The alarm is a warning by default. It shows or writes in the alarm log which blocks are omitted, as information for the customer. Machining is not stopped.<br><br>The alarm can be suppressed with MD11410 \$MN_SUPPRESS_ALARM_MASK bit1 = 1.<br><br>The alarm can be configured with MD11411 \$MN_ENABLE_ALARM_MASK Bit16 = 1 so that the machining is stopped. This setting has priority over the above-mentioned behavior of MD11410 \$MN_SUPPRESS_ALARM_MASK Bit1. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Remedy:**

- The behavior is correct at narrow places that cannot be machined with the active tool.
- Modify the part program if necessary.
- Use tool with smaller radius if necessary.
- Program CDOF/CDOF2 if bottleneck detection is active.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**10764 [Channel %1: ] Block %2 discontinuous path with active tool radius compensation**

**Parameters:**

%1 = Channel number  
%2 = Block number, label

**Explanation:** This alarm occurs when, with active tool radius compensation, the starting point used for calculating the compensation is not identical to the end point of the preceding block. This situation can occur, for example, when a geometry axis is traversed between two positions as a positioning axis or when, with an active kinematic transformation (e.g. 5-axis transformation) the tool length compensation is altered.

**Reaction:**

Correction block is reorganized.  
Local alarm reaction.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm at block end.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**10770 [Channel %1: ] Block %2 change of corner type due to change of orientation with active tool radius compensation**

**Parameters:**

%1 = Channel number  
%2 = Block number, label

**Explanation:** The type of a corner (inside or outside corner) depends not only on the programmed path but also on the tool orientation. For this purpose, the programmed path is projected in the plane perpendicularly to the actual tool orientation and the corner type is determined there. If a change in orientation is programmed (in one or several blocks) between two traversing blocks, resulting in the type of corner at the end of the first traversing block being different from that at the start point of the second block, the above error message is issued.

**Reaction:**

Correction block is reorganized.  
Local alarm reaction.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm at block end.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**10776 [Channel %1: ] Block%2 axis %3 must be geometry axis if tool radius compensation is active**

**Parameters:**

%1 = Channel number  
%2 = Block number, label  
%3 = Axis name

**Explanation:** This alarm occurs when an axis that is required for tool radius compensation is not a geometry axis. With CUT2DF, the axis can be a positioning axis perpendicular to the machining plane; with all other types of compensation (CUT2DF, CUT3DC, CUT3DF, CUT3DFF), all geometry axes must be operated as such.

**10794 [Channel %1: ] Block %2 angle specification missing in 2nd block during linear interpolation with angles**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Explanation:</b>           | The angle is missing from the second block when programming two straight lines with angle specification. This error can only occur if an angle was programmed in the preceding block, but no axis of the active plane was programmed in that block. The cause of the error may therefore also have been the intention to program a single straight line with an angle in the previous block. However, in this block, exactly one axis of the active plane must be programmed. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                                                                                                                                                                                                                                                                                                                                   |

|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>The programming of a straight line specified both positions of the active plane and an angle. The position of the end point is thus over-specified.</p> <p>The alarm may also be output if the position of the programmed coordinate cannot be reached with the specified angle. If a contour consisting of two straight lines is to be programmed with angles, it is possible to specify the two axis positions of the plane and an angle in the second block. The error can also occur if, due to a programming error, the preceding block cannot be interpreted as the first subblock of such a contour. A block is interpreted as the first block of a two-block contour if an angle, but not an axis of the active plane, was programmed, and if the block itself is not already the second block of a contour.</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Local alarm reaction.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm at block end.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**10861 [Channel %1: ] Block %3 velocity of positioning axis %2 is zero**

|                               |                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis<br>%3 = Block number, label                                                       |
| <b>Explanation:</b>           | No axis velocity has been programmed and the positioning velocity set in the machine data is zero.                 |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.          |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Enter a different velocity in MD32060 \$MA_POS_AX_VELO. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                   |

|                               |                                                                                                                                                                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>10862</b>                  | <b>[Channel %1: ] Block %2 master spindle also used as path axis</b>                                                                                                                                                                                                            |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                 |
| <b>Explanation:</b>           | A contour has been programmed that also includes the master spindle as contouring axis. However, the velocity of the contour is derived from the rotational speed of the master spindle (e.g. G95).                                                                             |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                       |
| <b>Remedy:</b>                | Modify the program so that no reference is possible to the program itself.                                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                |
| <b>10865</b>                  | <b>[Channel %1: ] Block %2 FZ active, but no tool offset, tool %3</b>                                                                                                                                                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number<br>%3 = Tool                                                                                                                                                                                                              |
| <b>Explanation:</b>           | For the displayed traversing block a tooth feedrate is active, but no tool offset.<br>Traversing can be performed after the error has been acknowledged. For calculation of the effective feedrate one tooth per revolution will be assumed.                                    |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                                                                                                                                     |
| <b>Remedy:</b>                | Check the NC program for correct tool selection and correct it, if required; then continue the program with NC start.<br>Or:<br>Continue the NC program with NC start. For calculation of the effective feedrate one tooth per revolution is assumed.                           |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                |
| <b>10866</b>                  | <b>[Channel %1: ] Block %2 FZ is active, but the number of teeth of the active D number %4 of tool %3 is zero.</b>                                                                                                                                                              |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Identifier<br>%4 = D number                                                                                                                                                                                             |
| <b>Explanation:</b>           | Tooth feedrate is active for the displayed traversing block, but a D number of 0 is selected with \$TC_DPNT (number of teeth).<br>Traversing can be performed after acknowledgment of the error. For calculation of the effective feedrate one tooth per revolution is assumed. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                  |
| <b>Remedy:</b>                | Check the NC program for correct tool selection and correct it, if required; then continue the NC program with NC start.<br>Or:<br>Continue the NC program with NC start. The feedrate will be calculated assuming 1 tooth.                                                     |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                |

| <b>Explanation:</b>           | Between 2 blocks containing the contour elements and to be joined with a chamfer or a radius (CHF, RND), so many dummy blocks have been programmed without contour information that the internal buffer is too small.                                                                                                                                                                                                                                                           |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Modify part program such that the number of dummy blocks is reduced.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                |

|                               |                                                                                                                                                                                                                                                                                                                                                                |

|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | In the B spline the distance between nodes PL (node = point on spline at which 2 polynomials meet) has been programmed with zero too often in succession (i.e. the "multiplicity" of a node is too great).<br>In the quadratic B spline the node distance may not be specified more than twice with 0 in succession, and in the cubic B spline not more than 3 times. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | Program the node distance PL = 0 in succession no more than the degree of the B spline used.                                                                                                                                                                                                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                      |

---

**10900 [Channel %1: ] Block %2 no S value programmed for constant cutting speed**

|                               |                                                                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                               |
| <b>Explanation:</b>           | If G96 is active, the constant cutting speed under address S is missing.                                                                                                                      |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.                                                                                     |
| <b>Remedy:</b>                | Program constant cutting speed under S in [m/min] or deselect the function G96. For example, with G97 the previous feed is retained but the spindle continues to rotate at the current speed. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                              |

---

**10910 [Channel %1: ] Block %2 irregular velocity waveform of one path axis**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b>           | When the path axis waveforms were analyzed during block preparation, a large local deviation relative to the path velocity was detected in the velocity waveform of one or more path axes.<br>Such a situation can have the following causes: <ul style="list-style-type: none"><li>- The path runs close to singular positions of the machine kinematics.</li><li>- The programmed contour characteristic is very uneven.</li><li>- The FGROUP definition is unfavorable relative to the contour.</li><li>- The setting MD28530 \$MC_MM_PATH_VELO_SEGMENTS=0 is inadequate for curvature changes occurring within one block. This problem occurs more frequently with G643, G644 and COMPCAD.</li><li>- A kinematic transformation has been implemented with insufficient numerical accuracy.</li></ul> The path velocity is generally reduced substantially in order to avoid axis overloads safely. An apparent machine standstill may occur. Severe axis movements occur suddenly as soon as the singular position is reached. |
| <b>Reaction:</b>              | Alarm display.<br>Warning display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | Dividing a block into several smaller ones often provides an improvement.<br>If MD28530 \$MC_MM_PATH_VELO_SEGMENTS=0 is set, then the alarm may be avoidable by a value MD28530 \$MC_MM_PATH_VELO_SEGMENTS=3 or 5, as the blocks are then analyzed considerably more accurately.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>10916</b>                  | <b>[Channel %1: ] Block %2 Preparation problem in LookAhead (Identifier %3, Details %4)</b>                                                                                                                    |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Error code<br>%4 = Error details                                                                                                                       |
| <b>Explanation:</b>           | The NCK was incorrectly parameterized (under certain circumstances the parameterized memory is not sufficient), this is the reason that the generated profile is not as smooth and uniform as it could be.     |
| <b>Reaction:</b>              | Local alarm reaction.<br>Alarm display.<br>Warning display.                                                                                                                                                    |
| <b>Remedy:</b>                | Change the parameterization (increase the LookAhead memory and/or IPO buffer, change tolerances).<br>1010: Increase IPO buffer to at least 50 blocks, or maximum number of blocks in the braking ramp times 2. |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                   |

---

|                               |                                                                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>10917</b>                  | <b>[Channel %1: ] Block %2 Warning of COMPSURF function (code %3, details %4)</b>                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Error code<br>%4 = Error details                                          |
| <b>Explanation:</b>           | COMPSURF was only able to work with restrictions.<br>The warning is only displayed if MD11411 \$MN_ENABLE_ALARM_MASK bit1 is set. |
| <b>Reaction:</b>              | No alarm reaction.<br>Warning display.                                                                                            |
| <b>Remedy:</b>                | 1: Modify parameterization (smaller tolerance, larger block buffer).                                                              |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                      |

---

|                               |                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>10930</b>                  | <b>[Channel %1: ] Block %2 interpolation type not allowed in stock removal contour</b>                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                        |
| <b>Explanation:</b>           | The following types of interpolation are allowed in the contour program for stock removal: G00, G01, G02, G03, CIP, CT |
| <b>Reaction:</b>              | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.             |
| <b>Remedy:</b>                | In the contour subroutine, program only path elements that consist of straight lines and arcs.                         |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                   |

|                               |                                                                                                                                                                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>10931</b>                  | <b>[Channel %1: ] Block %2 incorrect stock removal contour</b>                                                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                              |
| <b>Explanation:</b>           | The following errors occurred in the subroutine for the contour during stock removal:<br>- Full circle<br>- Overlapping contour elements<br>- Wrong start position                                                                           |
| <b>Reaction:</b>              | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                   |
| <b>Remedy:</b>                | The errors listed above must be corrected in the subroutine for the stock removal contour.                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                         |
| <b>10932</b>                  | <b>[Channel %1: ] Block %2 preparation of contour has been restarted</b>                                                                                                                                                                     |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                              |
| <b>Explanation:</b>           | The first contour preparation/contour decoding run must be terminated with EXECUTE.                                                                                                                                                          |
| <b>Reaction:</b>              | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                   |
| <b>Remedy:</b>                | Program the keyword EXECUTE to terminate the contour preparation in the part program before again calling up contour segmentation (keyword CONTPRON).                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                         |
| <b>10933</b>                  | <b>[Channel %1: ] Block %2 contour programm does not contain enough contour blocks</b>                                                                                                                                                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                              |
| <b>Explanation:</b>           | The contour program contains:<br>- Less than 3 contour blocks with CONTPRON<br>- No contour blocks with CONTDCON                                                                                                                             |
| <b>Reaction:</b>              | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                   |
| <b>Remedy:</b>                | Increase the size of the program with the stock removal contour to include at least 3 NC blocks with movements in both axes of the current machining plane.                                                                                  |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                         |
| <b>10934</b>                  | <b>[Channel %1: ] Block %2 array for contour segmentation is set too small</b>                                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                              |
| <b>Explanation:</b>           | During contour segmentation (activated with the keyword CONTPRON), the field for the contour table has been detected as too small. For every permissible contour element (circle or straight line) there must be a row in the contour table. |

|                               |                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                          |
| <b>Remedy:</b>                | Base the definition of the field variables of the contour table on the contour elements to be expected. The contour segmentation divides some NC blocks into as many as 3 machining cuts. Example: N100 DEF TABNAME_1 [30, 11] Field variables for the contour table provide for 30 machining cuts. The number of columns (11) is a fixed quantity. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                |

---

|                               |                                                                                                                                                                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>10950</b>                  | <b>[Channel %1: ] Calculation of arc length function too inaccurate</b>                                                                                                                                                                                                         |
| <b>Parameters:</b>            | %1 = Channel number                                                                                                                                                                                                                                                             |
| <b>Explanation:</b>           | With active polynomial interpolation, the arc length function could not be calculated with the required accuracy.                                                                                                                                                               |
| <b>Reaction:</b>              | Alarm display.<br>Warning display.                                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | Increase MD20262 \$MC_SPLINE_FEED_PRECISION.<br>Reserve more memory for the representation of the arc length polynomials. Use MD28540 \$MC_MM_ARCLENGTH_SEGMENTS to specify how many polynomial segments can be used per block in order to approximate the arc length function. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                |

---

|                               |                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>10959</b>                  | <b>[Channel %1: ] Block %2 SUPD is not permissible with active 3DF* radius compensation.</b>                                                |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                             |
| <b>Explanation:</b>           | Suppression of the tool offset is not permissible with active radius compensation for face milling because of the contour violation.        |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end. |
| <b>Remedy:</b>                | Modify part program.                                                                                                                        |

---

|                               |                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>10960</b>                  | <b>[Channel %1: ] Block %2 Radius compensation of type CUT3DF* ( TRC for face milling ) can only be used with the function COMPSURF</b>                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                               |
| <b>Explanation:</b>           | Tool radius compensation for face milling must be used with the function COMPSURF. If CUT3DF* tool radius compensation is active, COMPSURF must be activated. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                   |
| <b>Remedy:</b>                | Modify the part program.                                                                                                                                      |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                              |

|                               |                                                                                                                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>10961</b>                  | <b>[Channel %1: ] Block %2 maximum cubic polynomials are allowed on active radius compensation.</b>                                                                                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                               |
| <b>Explanation:</b>           | With active radius compensation, only up to cubic polynomials are permissible for the geometry axes. In this case no 4th or 5th degree polynomials can be programmed.                                                                         |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                                                                                                   |
| <b>Remedy:</b>                | Modify part program.                                                                                                                                                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                              |
| <b>10963</b>                  | <b>[Channel %1: ] Block %2 COMPSURF is unable to smooth adequately</b>                                                                                                                                                                        |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                               |
| <b>Explanation:</b>           | Smoothing by COMPSURF is not optimal because limited by internal memory sizes.<br>The alarm only occurs if MD11400 \$MN_TRACE_SELECT bit10 is set; otherwise only warning 10917 is output.                                                    |
| <b>Reaction:</b>              | Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>Interpreter stop                                                                                                                                                     |
| <b>Remedy:</b>                | Reduce tolerance (CTOL, OTOL, ATOL) in the part program.                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                          |
| <b>10964</b>                  | <b>[Channel %1: ] Block %2 Certain functions are limited for this system</b>                                                                                                                                                                  |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Cause                                                                                                                                                                                 |
| <b>Explanation:</b>           | Some functions are limited for this system. This alarm may be caused by the following:<br>Cause:<br>1. When COMPSURF is active, more axes are traversed than are permissible for this system.<br>2. CUT3DFD is not permitted for this system. |
| <b>Reaction:</b>              | Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>Interpreter stop                                                                                                                                                     |
| <b>Remedy:</b>                | 1. Program fewer axes per block.<br>2. Deactivate CUT3DFD.                                                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                          |
| <b>10990</b>                  | <b>[Channel %1: ] Block %2 CPRECON not possible for axis %3 with FIR filter</b>                                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis                                                                                                                                                                                  |

|                               |                                                                                                                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | CPRECON is active, but for one axis with FIR filter (MD32402 \$MA_AX_JERK_MODE=5) no memory space was provided with MD38020 \$MA_MM_CPREC_FIR_POINTS.<br>This is a configuration error. |
| <b>Reaction:</b>              | Alarm display.<br>Interface signals are set.<br>Interpreter stop                                                                                                                        |
| <b>Remedy:</b>                | Provide memory space for the function with MD38020 \$MA_MM_CPREC_FIR_POINTS.                                                                                                            |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                    |

**12000 [Channel %1: ] Block %2 address %3 programmed repeatedly**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source string of the address                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Explanation:</b>           | Most addresses (address types) may only be programmed once in an NC block, so that the block information remains unambiguous (e.g. X... T... F... etc. - exception: G and M functions).                                                                                                                                                                                                                                                                                                                                                       |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.<br>- Remove from the NC program addresses that occur more than once (except for those where multiple value assignments are allowed).<br>- Check whether the address (e.g. the axis name) is specified via a user-defined variable (this may not be easy to see if allocation of the axis name to the variable is performed in the program through computational operations only). |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

---

**12010 [Channel %1: ] Block %2 address %3 address type programmed too often**

|                               |                                                                                                                                                                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source string of the address                                                                                                                                                                                                               |
| <b>Explanation:</b>           | The number of times each address type may occur in an NC block is defined internally (for instance, all axes together form one address type to which a block limit also applies).                                                                                                                  |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                   |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECTION. The correction pointer positions on the incorrect block.<br>The program information must be split up over several blocks (but make sure that the functions are of the block-by-block type!). |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                   |

---

**12020 [Channel %1: ] Block %2 illegal address modification**

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Explanation:</b> | Valid address types are 'IC', 'AC', 'DC', 'CIC', 'CAC', 'ACN', 'ACP', 'ACAN', 'CACP'. Not each of these address modifications can be used for each address type. The Programming Guide specifies which of these can be used for the various address types. If this address modification is applied to address types that are not allowed, then the alarm is generated, e.g.:<br>N10 G02 X50 Y60 I=DC(20) J30 F100<br>interpolation parameters with DC. |

|                               |                                                                                                                                                                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                   |
| <b>Remedy:</b>                | Key: Press the NC STOP key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer is then positioned on the incorrect block.<br>Apply block-by-block address modifications only for permissible addresses, in accordance with the Programming Manual. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                   |

---

|                               |                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12030</b>                  | <b>[Channel %1: ] Block %2 invalid parameter or data type in %3</b>                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source string                                                                                                                                                                                                                                                                                                                   |
| <b>Explanation:</b>           | In polynomial interpolation, polynomials must not be greater than the 3rd degree (refer to Programming Guide).<br>$f(p) = a0 + a1 p + a2 p^2 + a3 p^3$<br>The coefficients a0 (the starting points) are identical to the end points of the preceding block and need not be programmed. In the polynomial block, a maximum of 3 coefficients per axis is therefore allowed (a1, a2, a3). |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.                                                                                                                                                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                        |

---

|                    |                                                                                  |
|--------------------|----------------------------------------------------------------------------------|
| <b>12050</b>       | <b>[Channel %1: ] Block %2 DIN address %3 not configured</b>                     |
| <b>Parameters:</b> | %1 = Channel number<br>%2 = Block number, label<br>%3 = DIN address in the block |

|                               |                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The name of the DIN address (e.g. X, U, X1) is not defined in the control. In addition to the fixed DIN addresses, the control also has variable addresses. Refer to "Variable addresses" in the Programming Guide. The names of these addresses can be altered by machine data.<br>e.g.: DIN identifier -> Configured identifier<br>G01 -> LINE, G04 -> WAIT ... |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                  |
| <b>Remedy:</b>                | Study the Programming Guide and the machine data with respect to the addresses actually configured and their significance and correct the DIN block accordingly.                                                                                                                                                                                                  |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                  |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Explanation:</b>           | The G functions that can be used in the part program are divided into groups that are syntax defining or non-syntax defining. Only one G function may be programmed from each G group. The functions within a group are mutually preclusive. The alarm refers only to the non-syntax defining G functions. If several G functions from these groups are called in one NC block, the last of these in a group is active in each case (the previous ones are ignored).<br>Syntax defining G functions: 1. to 4th G group<br>Non-syntax defining G functions: 5. to nth G group |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.<br>No remedy is required. You should, however, check whether the G function last programmed really is the one required.                                                                                                                                                                                                                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>The grammar in this block is incorrect at the text position indicated. The precise reason for this error cannot be specified in more detail because there are too many possibilities for error.</p> <p>Example 1:<br/>N10 IF GOTOF ... ; the condition for the jump is missing!</p> <p>Example 2:<br/>N10 DEF INT VARI=5<br/>N11 X VARI ; the operation is missing for the X and VARI variables</p> <p>Example 3:<br/>N13 R1=5<br/>N15 R1=10 M=R1 ; value assignments must stand alone in the block, there must not be any other commands, such as auxiliary function outputs or traversing.</p> <p>The cause may also be the use of Unicode characters. This is indicated by the representation of characters not included in the ASCII character set in the alarm text.</p> <p>Whether a character not included in the ASCII character set is transformed into a space or alarm 12080 is output can be set using bit 3 of MD 10280 \$MN_PROG_FUNCTION_MASK.</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | <p>Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.</p> <p>Analyze the block and correct it in accordance with the syntax rules given in the Programming Guide.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Remedy:</b>                | <p>Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.</p> <p>Program function without parameter transfer.</p>                                                               |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                                                                                              |

|                     |                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12100</b>        | <b>[Channel %1: ] Block %2 number of passes %3 not permissible</b>                                                                                                                                                                                                                                                                                                              |
| <b>Parameters:</b>  | <p>%1 = Channel number</p> <p>%2 = Block number, label</p> <p>%3 = Number of passes</p>                                                                                                                                                                                                                                                                                         |
| <b>Explanation:</b> | <p>The subroutines called with MCALL are modal, i.e. after each block with positional information a routine run is automatically performed once. For this reason, programming of the number of passes under address P is not allowed.</p> <p>The modal call is effective until another MCALL is programmed, either with a new subroutine name or without (delete function).</p> |
| <b>Reaction:</b>    | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                 |

**Remedy:** Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.  
Program the subroutine call MCALL without number of passes.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12110 [Channel %1: ] Block %2 block syntax cannot be interpreted**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The addresses programmed in the block are not permissible together with the valid syntax defining G function, e.g. G1 I10 X20 Y30 F1000.

An interpolation parameter must not be programmed in the linear block.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.  
Check the block structure and correct in accordance with the programming requirements.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12120 [Channel %1: ] Block %2 G function not separately programmed**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The G function programmed in this block must be alone in the block. No general addresses or synchronous actions may occur in the same block. These G functions are:

G25, G26: Working area and spindle speed limitation  
G110, G111, G112: Pole programming with polar coordinates  
G92: Spindle speed limitation with v constant  
STARTFIFO, STOPFIFO: Control of preprocessing buffer  
E.g. G4 F1000 M100: no M function allowed in the G4 block.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Program G function by itself in the block.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12140 [Channel %1: ] Block %2 functionality %3 not implemented**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Software construct in the source text

**Explanation:** In the full configuration of the control functions are possible that are not yet implemented in the current version.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.  
The displayed function must be removed from the program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

**12162 [Channel %1: ] Block %2 Physical unit not allowed**

**Parameters:**

- %1 = Channel number
- %2 = Block number, label

**Explanation:** In a DEF or REDEF instruction, a physical unit may only be defined for variables of data type INT or REAL. Furthermore, only the following values may be programmed for the physical unit:

- 0 No physical unit
- 1 Linear or angular position, dependent upon axis type
- 2 Linear position [mm ; inch]
- 3 Angular position [degrees]
- 4 Linear or angular velocity, dependent upon axis type
- 5 Linear velocity [mm/min]
- 6 Angular velocity [rev/min ]
- 7 Linear or angular acceleration, dependent upon axis type
- 8 Linear accel. [m/s<sup>2</sup> ; inch/s<sup>2</sup>]
- 9 Angular accel. [rev/s<sup>2</sup> ]
- 10 Linear or angular jerk
- 11 Linear jerk [m/s<sup>3</sup> ; inch/s<sup>3</sup>]
- 12 Angular jerk [rev/s<sup>3</sup> ]
- 13 Time [s]
- 14 Position controller gain [16.667/s]
- 15 Revolutionary feedrate [mm/rev ; inch/rev]
- 16 Unit for temperature compensation values, dependent upon axis type
- 18 Force [N]
- 19 Weight [kg]
- 20 Moment of inertia [kgm<sup>2</sup>]
- 21 Per cent
- 22 Frequency [Hz]
- 23 Voltage [V]
- 24 Current [A]
- 25 Temperature [degrees Celsius]
- 26 Angle [degrees]
- 27 KV [ 1000/min ]
- 28 Linear or angular position [mm|deg or inch|deg]
- 29 Cutting speed [m/min; feet/min]
- 30 Peripheral velocity [m/s; feet/s]
- 31 Resistance [ohms]
- 32 Inductance [mH]
- 33 Torque [Nm]
- 34 Torque constant [Nm/A]
- 35 Current controller gain [V/A]
- 36 Speed controller gain [Nm/rad s<sup>-1</sup>]
- 37 Speed [rev/min]
- 42 Power [kW]
- 43 Low power [μA]
- 46 Low torque [μNm]
- 48 Per mill HZ\_PER\_SEC = 49, [Hz/s]
- 65 Flow [l/min]
- 66 Pressure [bar]
- 67 Volume [cm<sup>3</sup>]
- 68 Controlled system gain [mm/Vmin]
- 69 Controlled system gain force controller [N/V]
- 155 Thread pitch [mm/rev; inch/rev]
- 156 Thread pitch change [mm/rev<sup>2</sup> ; inch/rev<sup>2</sup>]

|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | If the alarm occurs in the part program (DEF instruction), press the NC Stop key and select the function "Compensation block" using PROGRAM CORRECT softkey. The cursor is placed on the incorrect block.<br>In the compensation block the data type can now be adjusted in the DEF instruction, or the physical unit (PHU xy) must be removed.<br>If the alarm occurs on compiling a GUD or ACCESS file, correct the GUD or ACCESS definition file (DEF file). |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                |

---

|                               |                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12163</b>                  | <b>[Channel %1: ] Block %2 Change of access protection not allowed</b>                                                                                                                                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                              |
| <b>Explanation:</b>           | Changing the access rights for system variables (with REDEF) is not allowed in GUD files. They can only be changed in the ACCESS files (_N_SYACCESS_DEF, _N_SACCESS_DEF, _N_MACCESS_DEF and _N_UACCESS_DEF). |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                             |
| <b>Remedy:</b>                | Cut the REDEF instruction from the GUD file and paste it into one of the ACCESS files.                                                                                                                       |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                             |

---

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12164</b>                  | <b>[Channel %1: ] Block %2 access protection programmed more than once %3</b>                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Duplicate protection level programming                                                                                                                                                                                                                                                                                                                                                           |
| <b>Explanation:</b>           | The language commands APW and APR are used to program access protection for access to both the part program and the OPI. APWP and APRP define access protection from the part program; APWB and APRB define access protection via the OPI. Programming APW in the same block together with APWP or APWB or programming APR in the same block together with APRP or APRB will lead to a conflict, as the protection level assignment is no longer unique. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | If access protection in the part program and on the OPI needs to be set to different levels, only the language commands APWP, APWB, APRP and APRB may be used. If access protection is to be the same in the part program and on the OPI, it can also be programmed with APW or APR, although in this case the APWP and APWB or APRP and APRB commands must not be programmed in the same block.                                                         |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                         |

---

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12170</b>        | <b>[Channel %1: ] Block %2 name %3 defined several times</b>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label<br>%3 = Symbol in block                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Explanation:</b> | The symbol shown in the error message has already been defined in the active part program. Note that user-defined identifiers may occur more than once if the multiple definition occurs in other (sub)programs, i.e. local variables may be redefined with the same name if the program has been exited (subprograms) or has already been concluded. This applies both to user-defined symbols (labels, variables) and to machine data (axes, DIN addresses and G functions). |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                               |

|                               |                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remedy:</b>                | The symbol already known to data management is displayed. This symbol must be looked for in the definition part of the current program using the program editor. The 1st or 2nd symbol must be given a different name. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                       |

---

|                               |                                                                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12180</b>                  | <b>[Channel %1: ] Block %2 illegal chaining of operators %3</b>                                                                                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Chained operators                                                                                                                                            |
| <b>Explanation:</b>           | Operator chaining means the writing in sequence of binary and unary operators without using any form of parentheses.<br>Example:<br>N10 ERG = VARA - (- VARB) ; correct notation<br>N10 ERG = VARA - - VARB ; error! |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                     |
| <b>Remedy:</b>                | Formulate the expression correctly and unambiguously making use of parentheses. This improves clarity and readability of the program.                                                                                |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                     |

---

|                               |                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12185</b>                  | <b>[Channel %1: ] Block %2 a bit combination with %3 is not permitted</b>                                                                                                                                             |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Address name                                                                                                                                                  |
| <b>Explanation:</b>           | A bit combination is not possible with the assignment to this address. Bit combinations are permitted only for coupling addresses ( CPMBRAKE, CPMVDI and CPMAL ).                                                     |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                      |
| <b>Remedy:</b>                | Change the part rogram.<br>If the data type of the address permits a bit combination, write the value of the address in a variable, make a bit combination with the variable, and assign the variable to the address. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                      |

---

|                               |                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12190</b>                  | <b>[Channel %1: ] Block %2 variable of type ARRAY has too many dimensions</b>                                                                                                                                                                                                                                         |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | Array with variables of type STRING may be no more than 1-dimensional, and with all other variables no more than 2-dimensional.                                                                                                                                                                                       |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.<br>Correct the array definition, with multi-dimensional arrays define a second 2-dimensional array if necessary and operate it with the same field index. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                      |

|                               |                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12200</b>                  | <b>[Channel %1: ] Block %2 symbol %3 cannot be created</b>                                                                                                                                                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Symbol in block                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | The symbol to be created with the DEF instruction cannot be created because:<br>- it has already been defined (e.g. as variable or function)<br>- the internal memory location is no longer sufficient (e.g. with large arrays)                                                                                                          |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Make the following checks:<br>- Check with the text editor whether the name to be allocated in the active program cycle (main program and called subprograms) has already been used.<br>- Estimate the memory requirements for the symbols already defined and reduce these if necessary by using fewer global and more local variables. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                         |
| <hr/>                         |                                                                                                                                                                                                                                                                                                                                          |
| <b>12205</b>                  | <b>[Channel %1: ] Block %2 area specification missing for GUD area</b>                                                                                                                                                                                                                                                                   |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                          |
| <b>Explanation:</b>           | The area specification<br>(NCK or CHAN) was not programmed in the definition instruction for a GUD variable.                                                                                                                                                                                                                             |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Complete the area specification for the GUD variable definition in the GUD definition file.<br>The definition of a GUD variable must conform to the following syntax:<br>DEF <Area> <Data type> <Variable name> e.g.<br>DEF NCK INT intVar1<br>DEF CHAN REAL realVar1                                                                    |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                         |
| <hr/>                         |                                                                                                                                                                                                                                                                                                                                          |

| <b>Explanation:</b>           | A string can also contain bytes that do not correspond to a character that can be entered or one that is available on a keyboard with a minimized number of keys. These characters can be input as binary or hexadecimal constants. They may occupy up to 1 byte each only - therefore be < 256, e.g.<br>N10 DEF STRING[2] OTTO=" 'HCA' 'HFE' "                                                                                                                                                                                        |

| <b>Explanation:</b>           | The macro technique supplies a 1-line instruction or series of instructions with a new identifier by means of the keyword DEFINE. There may be additional macros in the string of instructions down to a nesting depth of 3.<br>Example:<br>N10 DEFINE MACRO3 AS F100<br>N20 DEFINE MACRO2 AS MACRO3<br>N10 DEFINE MACRO1 AS G01 G91 X123 MACRO2                                                                                                                                                                                                                    |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.<br>Nested macros must be replaced by the full program information.                                                                                                                                                                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>12260</b>                  | <b>[Channel %1: ] Block %2 too many initialization values specified %3</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source string                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Explanation:</b>           | In the initialization of an array (array definition and value assignments to individual array elements) there are more initialization values than array elements. Example: N10 DEF INT OTTO[2,3]=(..., ..., {more than 6 values})                                                                                                                                                                                                                                                                                                                                   |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.<br>Check the NC program to establish whether:<br>1. During array definition the number of array elements (n,m) was indicated correctly (DEF INT FIELDNAME[n,m] e.g. an array with 2 lines and 3 columns: n=2, m=3). 2. During initialization the value assignments have been made correctly (values of the individual field elements separated by comma, decimal point for variables of the type REAL). |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>12261</b>                  | <b>[Channel %1: ] Block %2 initialization of %3 not allowed</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source string                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Explanation:</b>           | Frame type variables cannot be initialized in the definition. Example: DEF FRAME LOCFRAME = CTRANS(X,200)<br>Equally, no default values can be programmed for axes in the program run during field initialization via SET.<br>A REDEF instruction with PRLOC is only permitted for setting data, but not for machine data or variables.                                                                                                                                                                                                                             |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remedy:</b>                | Perform the following initialization in the separate block in the execution part of the program: DEF FRAME LOCFRAME LOCFRAME = CTRANS(X,200)<br>When using the SET expression for axis variables<br>replace DEF AXIS AXIS_VAR [10] AXIS_VAR [5] = SET (X, , Y) by: DEF AXIS AXIS_VAR [10] AXIS_VAR [5] = X AXIS_VAR [7] = Y                                                                                                                                                                                                                                         |

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 12270 [Channel %1: ] Block %2 macro identifier %3 already defined

**Parameters:** %1 = Channel number

%2 = Block number, label

%3 = Source string macro name

**Explanation:** The name of the macro to be selected by the instruction DEFINE is already defined in the control as:

Macro name

Keyword

Variable

Configured identifier.

**Reaction:** Correction block is reorganized.

Interface signals are set.

Alarm display.

**Remedy:** Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.

Select DEFINE instruction with another macro name.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 12280 [Channel %1: ] Block %2 maximum macro length %3 exceeded

**Parameters:** %1 = Channel number

%2 = Block number, label

%3 = Source string

**Explanation:** The string of instructions on the right side of the macro is limited to 256 characters. If an attempt is made to define a longer character string under one macro (possible only through V.24 input of NC blocks, because communication between operator panel and NCK is limited to a block length of 242 characters), an alarm is displayed.

**Reaction:** Correction block is reorganized.

Interface signals are set.

Alarm display.

**Remedy:** Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.

Divide the functions defined under the macro into 2 macros.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 12290 [Channel %1: ] Block %2 arithmetic variable %3 not defined

**Parameters:** %1 = Channel number

%2 = Block number, label

%3 = Source string arithmetic variable

**Explanation:** Only the R-variables are predefined as arithmetic variables. All other arithmetic variables must be defined with the DEF instruction before being used. The number of arithmetic parameters is defined via machine data. The names must be unambiguous and may not be repeated in the control (exception: local variables).

**Reaction:** Correction block is reorganized.

Interface signals are set.

Alarm display.

**Remedy:** Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.

Define the required variable in the definition part of the program (possibly in the calling program if it is to be a global variable).

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12300 [Channel %1: ] Block %2 call-by-reference parameter missing on subroutine call %3**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Source string

**Explanation:** In the subroutine definition, a formal REF parameter (call-by-reference parameter) has been specified with no actual parameter assigned to it.  
The assignment takes place in the subroutine call on the basis of the position of the variable name and not on the basis of the name!

Example:

Subroutine: (2 call-by-value parameters X and Y,  
1 call-by-reference parameter Z)

PROC XYZ (INT X, INT Y, VAR INT Z)

:

M17

ENDPROC

Main program:

N10 DEF INT X

N11 DEF INT Y

N11 DEF INT Z

:

N50 XYZ (X, Y) ; REF parameter Z missing

or

N50 XYZ (X, Z) ; REF parameter Z missing!

**Reaction:** Correction block is reorganized.

Interface signals are set.

Alarm display.

**Remedy:** Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.

Assign a variable to all REF parameters (call-by-reference parameters) of the subroutine when calling. No variable must be assigned to "normal" formal parameters (call-by-value parameters), as these are defaulted with 0.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12310 [Channel %1: ] Block %2 axis parameter missing on procedure call %3**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Source string

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>When calling the subroutine, an AXIS parameter is missing which, according to the EXTERN declaration, should be present. With the EXTERN instruction, user-defined subroutines (procedures) are made "known" that have a parameter transfer. Procedures without parameter transfer require no EXTERN declaration.</p> <p>Example:</p> <p>Subroutine XYZ (with the formal parameters):</p> <p>PROC XYZ (INT X, VAR INT Y, AXIS A, AXIS B)</p> <p>EXTERN instruction (with variable types):</p> <p>EXTERN XYZ (INT, VAR INT, AXIS, AXIS) Subroutine call (with actual parameters):</p> <p>N10 XYZ (, Y1, R_TISCH)</p> <p>Variable X is defaulted with value 0</p> <p>Variable Y is supplied with the value of the variable Y1 and returns the results to the calling program after the subroutine run</p> <p>Variable A is supplied with the axis in R_TISCH</p> <p>Variable B missing!</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | <p>Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.</p> <p>Program the missing AXIS parameter in the call.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                               |                                                                                                                                                                                                                                                                                                              |

| <b>Explanation:</b>           | <p>When calling a procedure (a subroutine) it is found that the type of the actual parameter cannot be converted into the type of the formal parameter. There are two possible cases:</p> <ul style="list-style-type: none"><li>- Call-by-reference parameter: Actual parameter and formal parameter must be of precisely the same type, e.g. STRING, STRING.</li><li>- Call-by-value parameter: Actual parameter and formal parameter can in principle be different providing conversion is basically possible. In the present case, however, the types are generally not compatible, e.g. STRING -&gt; REAL.</li></ul> <p>Overview of type conversions:</p> <ul style="list-style-type: none"><li>- from REAL to: REAL: yes, INT: yes*, BOOL: yes1), CHAR: yes*, STRING: -, AXIS: -, FRAME: -</li><li>- from INT to: REAL: yes, INT: yes, BOOL: yes1), CHAR: if value 0 ...255, STRING: -, AXIS: -, FRAME: -</li><li>- from BOOL to: REAL: yes, INT: yes, BOOL: yes, CHAR: yes, STRING: -, AXIS: -, FRAME: -</li><li>- from CHAR to: REAL: yes, INT: yes, BOOL: yes1), CHAR: yes, STRING: yes, AXIS: -, FRAME: -</li><li>- from STRING to: REAL: -, INT: -, BOOL: yes2), CHAR: only if 1 character, STRING: yes, AXIS: -, FRAME: -</li><li>- from AXIS to: REAL: -, INT: -, BOOL: -, CHAR: -, STRING: -, AXIS: yes, FRAME: -</li><li>- from FRAME to: REAL: -, INT: -, BOOL: -, CHAR: -, STRING: -, AXIS: -, FRAME: yes</li></ul> <p>1) Value &lt;= 0 corresponds to TRUE, value ==0 corresponds to FALSE.<br/>2) String length 0 =&gt; FALSE, otherwise TRUE.<br/>*) At type conversion from REAL to INT fractional values that are &gt;=0.5 are rounded up, others are rounded down.</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.<br/>Interface signals are set.<br/>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remedy:</b>                | <p>Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.<br/>Check transfer parameters of the subroutine call and define the application accordingly as call-by-value or call-by-reference-parameter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Explanation:</b> | <p>An attempt has been made to transfer actual parameters although axis parameters located before them have not been assigned. For procedure or function calls, the assignment of parameters that are no longer required can be omitted if no more parameters are to be transferred subsequently. Example: N10 FGROUP(X, Y, Z, A, B); a max. of 8 axes possible The following call-by-value parameters would then be initialized with zero because the space-dependent assignment has been lost on account of the missing axis parameters. Axes that can be omitted and following parameters do not occur in the predefined procedures and functions.</p> |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block. In predefined procedures and functions either remove the following parameters or transfer any preceding axis parameters. In user-defined procedures and functions, parameter transfer must be programmed in accordance with the instructions given in the machine manufacturer's programming guide. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                |

|                               |                                                                                                                                                                                                                                                                                                                   |

| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block.<br>Array initialization: Check the array index of the addressed element. The 1st array element is given the index [0,0], the 2nd array element [0,1] etc. The right array index (column index) is incremented first.<br>In the 2nd row, the 4th element is also addressed with the index [1,3] (the indices start at zero).<br>Array definition: Check the size of the array. The 1st number indicates the number of elements in the 1st dimension (number of rows), the 2nd number indicates the number of elements in the 2nd dimension (number of columns).<br>An array with 2 rows and 3 columns must be defined by specifying [2,3]. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                               |                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12410</b>                  | <b>[Channel %1: ] Block %2 incorrect index type for %3</b>                                                                                                                                                                                                                                                                  |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source string                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | In assigning a value to an element of an array variable, the array index was specified in a way that is not allowed.<br>Only the following are allowed as array index (in square brackets):<br>- Axis identifier, provided the array variable was defined as data type FRAME.<br>- Integer values for all other data types. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                            |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block. Correct indices of the array element with respect to variable definition or define the array variable differently.                                              |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                            |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12420</b>                  | <b>[Channel %1: ] Block %2 identifier %3 too long</b>                                                                                                                                                                                                                                                                                                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | The symbol to be defined or the specified jump target has a name which is longer than the 31 characters allowed.                                                                                                                                                                                                                                                                                      |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block. The symbol to be created or the target of program jumps (label) must conform to the system specifications, that means the name must begin with 2 letters (but the 1st sign must not be "\$") and may be up to a maximum of 31 characters. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                      |

|                     |                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>12430</b>        | <b>[Channel %1: ] Block %2 specified index is invalid</b>                                                       |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                 |
| <b>Explanation:</b> | In specifying an array index (in the array definition) an index was used that is outside the permissible range. |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                |

**Remedy:** Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block. Specify array index within the permissible range. Value range per array dimension: 1 - 32 767.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12440 [Channel %1: ] Block %2 maximum number of formal arguments exceeded**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** In the definition of a procedure (a subroutine) or in an EXTERN instruction, more than 127 formal parameters have been specified.

Example: PROC ABC (FORMPARA1, FORMPARA2, ... ... FORMPARA127, FORMPARA128, ...) EXTERN ABC (FORMPARA1, FORMPARA2, ... ... FORMPARA127, FORMPARA128, ...)

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block. A check must be made to determine whether all parameters really have to be transferred. If so, the formal parameters can be reduced by using global variables or R variables, or by grouping together parameters of the same type to form an array and transfer them in this form.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12450 [Channel %1: ] Block %2 label defined twice**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The label of this block already exists.

If the NC program is compiled off-line, the entire program is compiled block for block. During this procedure all multiple labels are recognized; this is not always the case with on-line compilation. (Only the actual program run is compiled here, i.e. program branches that are not passed through in this run are disregarded and could therefore contain programming errors).

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer is positioned on the block where the displayed label occurs for the 2nd time. Use the editor to search the part program where this label occurs for the 1st time, and change one of the names.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12460 [Channel %1: ] Block %2 maximum number of symbols exceeded with %3**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Source string

**Explanation:** The max. number of variable definitions (GUD, LUD), macro definitions, cycle programs and/or cycle parameters (PROC instruction) that the controller's data management system is able to handle has been exceeded.

If this alarm occurs in conjunction with alarm 15175, not enough memory for the preprocessing of the cycle program definitions is available (PROC instruction).

If this alarm occurs in conjunction with alarm 15180, then this alarm shows the name of the file (INI or DEF file) causing the error.

(For a list of names of INI files and their meaning -> please refer to alarm 6010)

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source string                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Explanation:</b>           | With indirectly programmed G functions, an invalid or non-allowed group number has been programmed. Allowed group number = 1. and 5 max. number of G groups. In the displayed block, a non-defined G function has been programmed. Only "real" G functions are checked, which begin with the address G, e.g. G555. "Named" G functions such as CSPLINE, BRISK etc. are interpreted as subroutine names.                                                                                                                        |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block. You should decide on the basis of the machine manufacturer's programming guide whether or not the displayed G function exists or is available, or whether a standard G function has been reconfigured (or introduced by an OEM). Remove G function from the part program or program function call in accordance with the machine manufacturer's programming guide. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Explanation:</b>           | The name used in the PROC or EXTERN instruction has already been defined in another call description (e.g. for cycles).<br>Example:<br>EXTERN CYCLE85 (VAR TYP1, VAR TYP2, ...)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Press the NC Stop key and select the function "Correction block" with the softkey PROGRAM CORRECT. The correction pointer positions on the incorrect block. A program name must be selected that has not yet been used as identifier. (Theoretically, the parameter declaration of the EXTERN instruction could also be adapted to the existing subroutine in order to avoid the alarm output. However, it would have been defined identically twice).                                                                                                                                                                                                                                                                     |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <hr/>                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Explanation:</b>           | The desired access authorization was not set. The desired protection level is either beyond the permitted value range or changing the protection level is not allowed.<br>The protection level may be changed only if:<br>1. The current protection level is equal to or higher than the level originally defined, and<br>2. The new protection level will be below the level originally defined.<br>The alarm also occurs if the access authorization is to be changed for a user data block that is not available.<br>The higher numerical values represent the lower protection levels. The lower 4 levels (from 7 to 4) correspond to the keyswitch positions, and the upper 4 levels are associated with 4 passwords. |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>\$A or \$V variables are assessed in real-time in motion synchronous actions, i.e. in the interpolation cycle. All other variables (e.g. user-defined variables) are still computed at block preparation. It is not permissible to index the index of a variable for block preparation with a real-time variable.</p> <p>Example:</p> <pre>DEF INT INPUT[3] WHEN \$A_IN[1] == INPUT[\$A_INA[1]] DO ...</pre> <p>The locally defined variable INPUT must not be indexed with a real-time variable.</p> <p>Program editing:</p> <pre>WHEN \$A_IN[1] == \$AC_MARKER[\$A_INA[1]] DO ...</pre> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | <p>Modify program: Use real-time variables.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Remedy:</b>                | <p>Modify part program. For the functions SYNFACT and PUTFTOCF only certain variables are allowed, for example \$AC_DTGPW.</p>                                                                                                                                                                                                                |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                                                                                                                                                       |

|                              |                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12585</b>                 | <b>[Channel %1: ] Block %2 variable %3 cannot be changed synchronously with motion</b>                                                                                                                                                                                                                                                                                                     |
| <b>Parameters:</b>           | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source symbol                                                                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>          | When assigning SYNFACT in motion synchronous actions and result variables, only special variables are allowed. Real-time synchronous access is allowed here.<br>Example:<br>WHEN \$AA_IM[AX1]>= 100 DO \$AC_TIME=1000. The variable \$AC_TIME (time from beginning of block) cannot be written                                                                                             |
| <b>Reaction:</b>             | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>               | Modify part program. Only certain variables are allowed for the function SYNFACT where real-time synchronous access is possible.                                                                                                                                                                                                                                                           |
| <b>Program continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                           |
| <b>12586</b>                 | <b>[Channel %1: ] Block %2 motion synchronous action: type conflict in variable %3</b>                                                                                                                                                                                                                                                                                                     |
| <b>Parameters:</b>           | %1 = Channel number<br>%2 = Block number<br>%3 = Source symbol                                                                                                                                                                                                                                                                                                                             |
| <b>Explanation:</b>          | Type conversion is not possible for online variables \$A.. or \$V.., which are evaluated or written in the interpolation cycle. Only variables of the same type can be linked or assigned to one another.<br>Example:<br>WHENEVER \$AA_IM[X] > \$A_IN[1] DO ...<br>An online variable of the REAL type (actual value) cannot be compared with a variable of the BOOL type (digital input). |
| <b>Reaction:</b>             | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>               | Modify the part program. Use variables of the same type.<br>Example 1:<br>WHENEVER \$AA_IM[X] > \$A_IN[1] DO ...<br>Instead use: WHENEVER \$AA_IM[X] > \$A_INA[1] DO ...<br>Example 2:<br>WHENEVER ... DO \$AC_MARKER[1]=\$AA_IM[X]-\$AA_MM[X]<br>Instead use: WHENEVER ... DO \$AC_PARAM[1]=\$AA_IM[X]-\$AA_MM[X]                                                                         |
| <b>Program continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                           |
| <b>12587</b>                 | <b>[Channel %1: ] Block %2 motion synchronous action: operation/function %3 not allowed</b>                                                                                                                                                                                                                                                                                                |
| <b>Parameters:</b>           | %1 = Channel number<br>%2 = Block number<br>%3 = Operator/function                                                                                                                                                                                                                                                                                                                         |
| <b>Explanation:</b>          | The specified function / operator is not permissible for logic operations of real-time variables in motion synchronous actions. The following operators/functions are permissible:<br>- == >= <= > < <> + - * /<br>- DIV MOD<br>- AND OR XOR NOT<br>- B_AND B_OR B_XOR B_NOT<br>- SIN COS TAN ATAN2 SQRT POT TRUNC ROUND ABS EXP LNX SPI                                                   |
| <b>Reaction:</b>             | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                           |

**Remedy:** Modify the part program.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12588 [Channel %1: ] Block %2 motion synchronous action: address %3 not allowed**

**Parameters:** %1 = Channel number  
%2 = Block number  
%3 = Address

**Explanation:** - The specified address cannot be programmed in motion-synchronous actions. Example: ID = 1 WHENEVER \$A\_IN[1]==1 DO D3  
- The cutting edge cannot be changed out of a motion-synchronous action.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify the part program.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12589 [Channel %1: ] Block %2 motion synchronous action: variable %3 not allowed with modal ID**

**Parameters:** %1 = Channel number  
%2 = Block number  
%3 = Variable name

**Explanation:** The modal ID in motion synchronous action must not be formed by means of an on-line variable.  
Examples:  
ID=\$AC\_MARKER[1] WHEN \$a\_in[1] == 1 DO \$AC\_MARKER[1] = \$AC\_MARKER[1]+1  
This can be corrected in the following way:  
R10 = \$AC\_MARKER[1]  
ID=R10 WHEN \$a\_in[1] == 1 DO \$AC\_MARKER[1] = \$AC\_MARKER[1]+1  
The ID in a synchronous action is always permanent, and cannot be changed in the interpolation cycle.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify the part program. Replace the on-line variable by an arithmetic variable.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12590 [Channel %1: ] Block %2 global user data cannot be created**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Global user data cannot be created because the user data block for this global user data is not available.  
The number of global user data blocks is defined in MD18118 \$MN\_MM\_NUM\_GUD\_MODULES.  
Here, \_N\_SGUD\_DEF corresponds to block 1, \_N\_MGUD\_DEF corresponds to block 2, \_N\_UGUD\_DEF corresponds to block 3, \_N\_GUD4\_DEF corresponds to block 4 etc.  
In the directory \_N\_DEF\_DIR, there is a file with definitions for global user data, the block number of which is greater than the number of blocks given in the MD.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Please inform the authorized personnel/service department. Increase MD18118 \$MN\_MM\_NUM\_GUD\_MODULES.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

|                               |                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12600</b>                  | <b>[Channel %1: ] Block %2 invalid line checksum</b>                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number                                                                                                           |
| <b>Explanation:</b>           | On processing an INI file or when executing a TEA file, an invalid line checksum has been detected.                                                |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                              |
| <b>Remedy:</b>                | Correct the INI file, or correct the MD and create a new INI file via "upload".                                                                    |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                           |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source string                                                                              |
| <b>Explanation:</b>           | An attempt has been made to use a single character access for a call-by-reference parameter.                                                       |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                   |
| <b>Remedy:</b>                | Save single characters in a user-defined CHAR variable, and transfer it.                                                                           |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                   |
| <b>12620</b>                  | <b>[Channel %1: ] Block %2 accessing this variable as single character not possible %3</b>                                                         |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Source string                                                                              |
| <b>Explanation:</b>           | The variable is not a user-defined variable. The single character access is only allowed for user-defined variables (LUD/GUD).                     |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                   |
| <b>Remedy:</b>                | Save the variable in a user-defined STRING variable, process it, and save it again.                                                                |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                   |
| <b>12630</b>                  | <b>[Channel %1: ] Block %2 skip ID/label in control structure not allowed</b>                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number                                                                                                           |
| <b>Explanation:</b>           | Blocks with control structures (FOR, ENDIF, etc.) cannot be concealed and must not contain any labels.                                             |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                   |
| <b>Remedy:</b>                | Correct the part program as follows:<br>Form the skip ID by an IF query.<br>Write the label alone in the block before the control structure block. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                   |

---

**12640 [Channel %1: ] Block %2 invalid nesting of control structures**

**Parameters:** %1 = Channel number  
%2 = Block number

**Explanation:** Error in program run: Opened control structures (IF-ELSE-ENDIF, LOOP-ENDLOOP etc.) are not terminated or there is no beginning of loop for the programmed end of loop.

Example:

LOOP ENDIF ENDLOOP

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the part program so that all open control structures are terminated.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**12641 [Channel %1: ] Block %2 maximum nesting depth of control structures exceeded**

**Parameters:** %1 = Channel number  
%2 = Block number

**Explanation:** Max. nesting depth control structures (IF-ELSE-ENDIF, LOOP-ENDLOOP etc.) exceeded. At the present time, the max. nesting depth is 8.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the part program. If necessary, move parts to a subroutine.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**12650 [Channel %1: ] block %2 axis identifier %3 different in channel %4**

**Parameters:** %1 = Channel number  
%2 = Block number  
%3 = Source symbol  
%4 = Channel number with different axis definition

**Explanation:** In cycles that are preprocessed at Power On, only those geometry and channel axis identifiers may be used that exist in all channels with the same meaning. In different channels, different axis indices are assigned to the axis identifier.

The axis identifiers are defined via MD20060 \$MC\_AXCONF\_GEOAX\_NAME\_TAB and MD20080 \$MC\_AXCONF\_CHANAX\_NAME\_TAB. Example: C is the 4th channel axis in channel 1 and the 5th channel axis in channel 2.

If the axis identifier C is used in a cycle that is preprocessed at Power On, then this alarm is issued.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Inform the authorized personnel/service department.

1. Modify machine data: Select the same identifiers for geometry and channel axes in all channels. Example: The geometry axes are called X, Y, Z in all channels. They can then also be programmed directly in preprocessed cycles.

2. Do not program the axis directly in the cycle, but as a parameter of the axis type. Example: Cycle definition:

PROC DRILL(AXIS DRILLAXIS) G1 AX[DRILLAXIS]=10 F1000 M17

Call from the main program:

DRILL(Z)

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

|                               |                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12660</b>                  | <b>[Channel %1: ] Block %2 motion synchronous action: variable %3 reserved for motion synchronous actions and technology cycles</b>                                                                                                                                                                                        |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number<br>%3 = Variable name                                                                                                                                                                                                                                                             |
| <b>Explanation:</b>           | The displayed variable may only be used in motion synchronous actions or in technology cycles. For example, '\$R1' may only be used in motion synchronous actions. In standard part programs R variables are programmed with R1.                                                                                           |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Modify the part program.                                                                                                                                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                           |
| <b>12661</b>                  | <b>[Channel %1: ] Block %2 technology cycle %3: no further subprogram call possible</b>                                                                                                                                                                                                                                    |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number<br>%3 = Name of the technology cycle call                                                                                                                                                                                                                                         |
| <b>Explanation:</b>           | In a technology cycle it is not possible to call a subroutine or another technology cycle.                                                                                                                                                                                                                                 |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Modify the part program.                                                                                                                                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                           |
| <b>12700</b>                  | <b>[Channel %1: ] Block %2 contour definition programming not allowed as modal sub-program is active</b>                                                                                                                                                                                                                   |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | In the external language mode, a block is programmed with contour definition and a modal cycle is active at the same time. Because of unclear address assignment (e.g. R = radius for contour definition or return plane for drilling cycle) contour definition programming must not be used when a modal cycle is active. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Modify part program.                                                                                                                                                                                                                                                                                                       |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                           |
| <b>12701</b>                  | <b>[Channel %1: ] Block %2 illegal interpolation type for contour definition active</b>                                                                                                                                                                                                                                    |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | In one contour definition block, G01 is not active as interpolation function. In one contour definition block, the linear interpolation always has to be selected with G01. G00, G02, G03, G33 etc. are not permitted.                                                                                                     |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Modify the part program. Program the linear interpolation with G01.                                                                                                                                                                                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                           |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Explanation:</b>           | During macro call with G65/G66 no program number was defined. The program number must be programmed with address "P".                                                                                                                                                                                                                                                                                                           |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | Modify the part program.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                |
| <hr/>                         |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>12722</b>                  | <b>[Channel %1: ] Block %2 multiple ISO_2/3 macro or cycle calls in the block</b>                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Explanation:</b>           | A mixture of cycle and macro calls are programmed in a block, e.g. as follows:<br>- Cycle calls with G81 - G89 together with an M macro in the block<br>- Macro call with G65/G66 together with M macros in the block.<br>G05, G08, G22, G23, G27, G28, G29, G30, G50.1, G51.1, G72.1, G72.2 functions (ISO mode) also execute subroutine calls. It is only permissible that one macro or cycle call can appear in an NC block. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                |

**Remedy:** Deactivate modal cycles or modal macro calls if one of the above mentioned G functions has been programmed.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

|                               |                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12724</b>                  | <b>[Channel %1: ] Block %2 no radius programmed for cylinder interpolation activation/deactivation</b>                                                                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | When programming G07.1 (cylinder interpolation TRACYL), no cylinder radius has been programmed. Selection of the cylinder interpolation (TRACYL) with G07.1 C <cylinder radius> deselect with G07.1 C0. For "C" the name of the rotary axis defined in the TRACYL machine data has to be programmed. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                     |
| <b>Remedy:</b>                | G07.1 block, program the cylinder radius under the name of the rotary axis for the cylinder interpolation.                                                                                                                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                     |

---

|                               |                                                                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>12726</b>                  | <b>[Channel %1: ] Block %2 illegal plane selection with parallel axes</b>                                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                           |
| <b>Explanation:</b>           | In a block with plane selection (G17 _ G19), a basic axis of the coordinate system must not be programmed together with the parallel axis assigned to it. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                          |
| <b>Remedy:</b>                | For plane selection with G17, G18, G19 either program the basic axis of the coordinate system or the assigned parallel axis.                              |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                          |

| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                 |
| <b>Explanation:</b> | The machine data MD24100 \$MC_TRAFO_TYPE_1, MD24110 \$MC_TRAFO_AXES_IN_1[1], MD24210 \$MC_TRAFO_AXES_IN_2[1] are incorrectly set for G07.1, G12.1.                              |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                |
| <b>Remedy:</b>      | Enter valid transformation identifier for TRACYL in MD24100 \$MC_TRAFO_TYPE_1 and the rotary axis number in MD24110 \$MC_TRAFO_AXES_IN_1[1] or MD24210 \$MC_TRAFO_AXES_IN_2[1]. |

---

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12740 [Channel %1: ] Block %2 modal macro call %3 not possible**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Source string

**Explanation:** When calling a modal macro no other modal macro, modal cycle or modal subroutine may be active.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify part program

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12750 [channel %1: ] block %2 T splitting not possible**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** ISO mode turning: T programming is not possible since the T word cannot be clearly separated by tool number and correction number.

Splitting the T word is determined by the machine data 10888 \$MN\_EXTERN\_DIGITS\_TOOL\_NO and 10889 \$MN\_EXTERN\_DIGITS\_OFFSET\_NO. However, only one of the two functions may be active, and at least one function must be active. Alarm occurs only then when no function is active (both MDs = 0) or both functions are active (both MDs <> 0).

**Reaction:** Interpreter stop  
Interface signals are set.  
Alarm display.

**Remedy:** Machine data  
Adjust 10888 EXTERN\_DIGITS\_TOOL\_NO or  
10889 EXTERN\_DIGITS\_OFFSET\_NO.  
At least one function must be active, but both functions must not be active either.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**12755 [channel %1: ] block %2 formatting %3 not possible**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Faulty format instructions

**Explanation:** The format instructions programmed with the ISOPRINT command are incorrect:

- various format instructions %m.nP and %.nP were applied
- other format instructions than %P were applied

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** - correct ISOPRINT command  
- within an ISOPRINT command, only format instructions of the same type %m.nP or %.nP may be applied

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Explanation:</b>           | The selected program %2 in channel%1 cannot be executed because the channel-specific start disable is set for this channel.<br>Background: When ShopMill or ShopTurn programs are selected or changed, the HMI performs a consistency check of the parameters that have been entered. During this time, the processing of the selected NC program is inhibited by the HMI setting what is known as the "channel-specific start disable". If an NC start is now rejected because of a set channel-specific start disable, then alarm 14004 is output as a function of MD 11411 \$MN_ENABLE_ALARM_MASK bit 15. The alarm is also output in the event of a block search, but in this case it is not dependent on MD 11411 \$MN_ENABLE_ALARM_MASK bit 15.                                                                       |

| <b>Explanation:</b>           | Program %3 cannot be executed, because the program-specific start disable has been set for this file.<br>Background: When an editing operation for a ShopMill or ShopTurn program has been completed, the HMI performs a consistency check of the parameters that have been entered. During this time, CNC program processing is inhibited by setting what is known as the "program-specific start disable" by the HMI. If NC start is pressed during the test, the start is not executed, and alarm 14005 is output as a function of MD 11411 \$MN_ENABLE_ALARM_MASK bit 6.<br>Alarm 14005 is also output if the part program processing encounters a subroutine for which the file attribute "start disable" is set.<br>After the test step has been completed, the program processing can continue by pressing NC start. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>14009</b>                  | <b>[Channel %1: ] Block %2 illegal program path %3</b>                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Program path                                                                                                                 |
| <b>Explanation:</b>           | The part program command CALLPATH was called with a parameter (program path) referring to a directory which does not exist in the file system of the NCK.                            |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                     |
| <b>Remedy:</b>                | - Modify the CALLPATH instruction such that the parameter contains the complete path name of the loaded directory.<br>- Load the programmed directory in the file system of the NCK. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                     |

|                               |                                                                                                                                                                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14010</b>                  | <b>[Channel %1: ] Block %2 invalid default parameter in subroutine call</b>                                                                                                                                                                                                                   |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                               |
| <b>Explanation:</b>           | In a subroutine call with parameter transfer, parameters have been omitted that cannot be replaced by default parameters (call-by-reference parameters or parameters of type AXIS. The other missing parameters are defaulted with the value 0 or with the unit frame in the case of frames). |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                              |
| <b>Remedy:</b>                | The missing parameters must be provided with values in the subroutine call.                                                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                              |

|                    |                                                                          |

| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | <p>Ensure that the subroutine (alarm parameter %3)</p> <ul style="list-style-type: none"><li>- is available in the part program memory</li><li>- has been released and is not being edited</li><li>- is available in the search path if not being called via an absolute path name.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

---

**14012 [Channel %1: ] Block %2 maximum subroutine level exceeded**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Block number, label</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b>           | <p>The maximum nesting depth of 16 program levels has been exceeded.</p> <p>Subroutines can be called from the main program, and these in turn may have a nesting depth of 15.</p> <p>For interrupt routines, two additional program levels can be used. This means that the total number of program levels is increased to 18.</p> <p>The program levels are jointly used by user programs and Siemens cycles and/or Siemens applications such as ShopMill and ShopTurn.</p> |
| <b>Reaction:</b>              | <p>Interpreter stop</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | <p>Modify the machining program so that the nesting depth is reduced, e.g. using the editor copy a subroutine of the next nesting level into the calling program and remove the call for this subroutine. This reduces the nesting depth by one program level.</p>                                                                                                                                                                                                            |
| <b>Programm continuation:</b> | <p>Clear alarm with the RESET key. Restart part program</p>                                                                                                                                                                                                                                                                                                                                                                                                                   |

---

**14013 [Channel %1: ] Block %2 number of subroutine passes invalid**

|                    |                                                            |
|--------------------|------------------------------------------------------------|
| <b>Parameters:</b> | <p>%1 = Channel number</p> <p>%2 = Block number, label</p> |
|--------------------|------------------------------------------------------------|

**Explanation:** In a subroutine call the programmed number of passes P is zero or negative.

**Reaction:** Correction block is reorganized.

Interface signals are set.

Alarm display.

**Remedy:** Program number of passes between 1 and 9 999.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

#### **14014 [Channel %1: ] Selected program %3 not available or will be edited**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Program name

**Explanation:** The selected part program is not in the NCK memory or the execution right for the part program has a higher level than the current access right.

During creation, this program received the protection level of the NC control which was active at the time.

In SW 5 or higher, a program edited on HMI can no longer be started with NC Start.

The alarm will also be issued if a file other than one of the specified definition files has been selected for the GUD or macro definition.

**Reaction:** Alarm display.

**Remedy:** Reload the program in the NCK memory or check and correct the name of the directory (workpiece overview) and the program (program overview) and reselect.

**Programm continuation:** Clear alarm with the Delete key or NC START.

#### **14015 [Channel %1: ] Block %2 program %3 is not enabled**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Program name

**Explanation:** The execution right currently set in the control (e.g. key switch position 0) is inadequate to execute part program %3.

**Reaction:** Correction block is reorganized.

Interface signals are set.

Alarm display.

**Remedy:** - Raise the execution right to match the protection level of part program %3  
- Assign a lower protection level to part program %3 or release (key switch protection level 0)

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

#### **14016 [Channel %1: ] Block %2 error when calling the subroutine via M/T function**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The following conflict was detected in a subprogram call per M or T function:

- In the block referenced by parameter %2, an M or T function replacement has already been activated:
- In the block referenced by parameter %2, a modal subprogram call is active
- In the block referenced by parameter %2, a subprogram return jump is programmed
- In the block referenced by parameter %2, the end of the part program is programmed
- In the block referenced by parameter %2, an M98 subprogram call is active, but only in the external language mode
- In the block referenced by parameter %2, a T function replacement is programmed with D function programming in the same part program line with active TLC (G43/G44) in the ISO2 system.
- In the block referenced by parameter %2, a T function replacement is programmed, configured at the end of block, and a subprogram call, for example by a modal cycle call.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | To replace an M or T function, ensure that a subprogram call or return jump has not already been performed as a result of other program constructs. Correct the part program if necessary.<br>Under the following conditions, you must perform the T function replacement at the start of the block:<br>- A T function replacement is configured with execution at end of block and a subprogram call is programmed in the same block<br>Set MD10719 \$MN_T_NO_FCT_CYCLE_MODE bit 1 = 1. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                         |

---

**14017 [Channel %1: ] Block %2 syntax error when calling the subroutine via M function**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Explanation:</b>           | When calling M code subroutine with parameter transfer, an illegal syntax was detected:<br>- Address extension not programmed as a constant.<br>- M function value not programmed as a constant.<br>Note:<br>If a parameter transfer has been programmed via MD10718 \$MN_M_NO_FCT_CYCLE_PAR for an M function replacement, the following restriction applies to this M function: both the address extension and the M function value must be programmed for replacement as constants. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Change the programming of the M function.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Remedy:</b>                | Modify the part program.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>14027</b>                  | <b>[Channel %1: ] Block %2 motion-synchronous action: Too many technology cycles programmed.</b>                                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | You can call a maximum of eight technology cycles with one motion-synchronous action. You exceeded the upper limit.                                                                                                                                                                                                                                                                                                                                        |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                           |

**Remedy:** Modify part program.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14028 [Channel %1: ] Block %2 motion-synchronous action: Technology cycle programmed with too many parameters**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
**Explanation:** Maximum number of transfer parameters for one technology cycle exceeded.  
**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.  
**Remedy:** Change technology cycle  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14030 [Channel %1: ] Block %2 combine OSCILL and POSP during oscillation with infeedmotion**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
**Explanation:** When oscillating controlled by synchronized actions, the assignment of oscillating and infeed axis (OSCILL) as well as the definition of the infeed (POSP) must be carried out in one NC block.  
**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.  
**Remedy:** Modify the part program.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14034 [Channel %1: ] Block %2 involute: angle of rotation too large**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
**Explanation:** With programming of the angle of rotation (with AR) for involute interpolation, the maximum programmable angle of rotation is limited if the involute is moving towards the basic circle. The maximum value is reached if the involute touches the basic circle. With MD21016 \$MC\_INVOLUTE\_AUTO\_ANGLE\_LIMIT = TRUE, each angle is accepted without an alarm; if necessary, the angle is automatically limited during interpolation.  
**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.  
**Remedy:** Modify part program.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14035 [Channel %1: ] Block %2 involute: start point invalid**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
**Explanation:** With involute interpolation, the start point of the involute must be outside the basic circle. The programmed center point or radius must be adapted accordingly.  
**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.  
**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14036 [Channel %1: ] Block %2 involute: end point invalid**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** With involute interpolation, the end point of the involute must be outside the basic circle. The programmed center point / radius or end point must be adapted accordingly.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14037 [Channel %1: ] Block %2 involute: radius invalid**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** With involute interpolation, the programmed radius of the basic circle must be greater than zero.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14038 [Channel %1: ] Block %2 involute not definable: end point error**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The programmed end point does not lie on the involute defined by the start point, radius and center point of the basic circle. The deviation of the effective end radius from the programmed value is greater than the permissible value specified in MD21015 \$MC\_INVOLUTE\_RADIUS\_DELTA.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14039 [Channel %1: ] Block %2 involute: end point programmed several times**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** With involute interpolation, either the end point with the geometry axis identifiers or the angle of rotation with AR=value can be programmed. Simultaneous programming of end point and angle of rotation in one block is not allowed, since the end point can thus not be defined exactly.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

| <b>Explanation:</b>           | <p>In circular interpolation, either the circle radii for the initial point and the end point are further apart or the circle center points are further apart than specified in the machine data.</p> <ol style="list-style-type: none"> <li>1. In circle radius programming the starting and end points are identical, thus the circle position is not determined by starting and end points.</li> <li>2. Radii: The NCK calculates from the present starting point and the other programmed circle parameters the radii for the starting and the end point.<br/>An alarm message is issued if the difference between the circle radii is either <ul style="list-style-type: none"> <li>- greater than the value in the MD21000 \$MC_CIRCLE_ERROR_CONST (for small radii, if the programmed radius is smaller than the quotient of the machine data MD21000 \$MC_CIRCLE_ERROR_CONST divided by MD21010 \$MC_CIRCLE_ERROR_FACTOR), or</li> <li>- greater than the programmed radius multiplied by the MD21000 \$MC_CIRCLE_ERROR_FACTOR (for large radii, if the programmed radius is greater than the quotient of the machine data MD21010 \$MC_CIRCLE_ERROR_CONST divided by MD21010 \$MC_CIRCLE_ERROR_FACTOR).</li> </ul> </li> <li>3. Center points: A new circle center is calculated using the circle radius at the starting position. It lies on the mid-perpendicular positioned on the connecting straight line from the starting point to the end point of the circle. The angle in the radian measure between both straight lines from the starting point to the center calculated/programmed as such must be lower than the root of 0.001 (corresponding to approx. 1.8 degrees).</li> <li>4. Full circle with INTERSEC: Full circle is not allowed for the INTERSEC function.</li> </ol> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | <p>Please inform the authorized personnel/service department.</p> <p>Check MD21000 \$MC_CIRCLE_ERROR_CONST and MD21010 \$MC_CIRCLE_ERROR_FACTOR. If the values are within reasonable limits, the circle end point or the circle mid-point of the part program block must be programmed with greater accuracy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Explanation:</b>           | <p>The alarm can be caused by the following:</p> <p>The tangent direction is not defined in the tangent circle programming, e.g. because no other traversing block has been programmed before the current block. No circle can be formed from start and end point as well as tangent direction because</p> <ul style="list-style-type: none"> <li>- seen from the start point - the end point is located in the opposite direction to that indicated by the tangent.</li> </ul> <p>It is not possible to form a tangent circle since the tangent is located perpendicular to the active plane.</p> <p>In the particular case in which the tangent circle changes to a straight line, several complete circular revolutions were programmed with TURN.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Explanation:** In the circle programming, an inadmissible number of full revolutions has been specified.  
The number of revolutions must not be negative and must not be greater than 1000000.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify the part program.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**14050 [Channel %1: ] Block %2 nesting depth for arithmetic operations exceeded**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** For calculating arithmetic expressions in NC blocks, an operand stack with a fixed set size is used. With very complex expressions, this stack can overflow. This may also occur with extensive expressions in synchronized actions.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Divide up complex arithmetic expressions into several simpler arithmetic blocks.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14051 [Channel %1: ] Block %2 arithmetic error in part program**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** - In calculating an arithmetic expression, an overflow has occurred (e.g. division by zero)  
- In a data type, the representable value range has been exceeded

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Analyze the program and correct the defective point in the program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14055 [Channel %1: ] Block %2 impermissible NC language substitution, error code %3**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Error code

**Explanation:** This alarm occurs in conjunction with an NC language substitution configured in MD30465 \$MA\_AXIS\_LANG\_SUB\_MASK.  
Error code %3 gives more detailed information about the cause of the problem:  
Error code:

1: Several events had been programmed, causing the replacement cycle to be called. Only one substitution is allowed per part program line.

2: A block-by-block synchronized action had also been programmed for the part program line with the NC language substitution.

3: The system variables \$P\_SUB\_SPOSIT and \$P\_SUB\_SPOSMODE were called outside a replacement cycle.

**Reaction:** Correction block is reorganized.  
Interpreter stop  
Interface signals are set.  
Alarm display.

**Remedy:** Modify the NC program

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14060 [Channel %1: ] Block %2 invalid skip level with differential block skip**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** With "Differential block skip", a skip level greater than 7 has been specified. (In packet 1 specification of a value for the skip level is rejected by the converter as a syntax error, i.e. the only possibility is a "Suppress block" ON/OFF on one level).

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter a skip level (number behind the slash) less than 8.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14065 [channel %1: ] block %2 error in SPRINT/ISOPRINT command: error code %4 information %3**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Additional information  
%4 = Error code

**Explanation:** When interpreting the SPRINT or ISOPRINT command, an error was detected which was described in more detail by parameter %4. Parameter %3 may supply additional information on the incurring problem.  
List of error codes (parameter %4):  
1: invalid format description %3 recognized  
2: Format %.nP: overrange when converting into 32 bit number  
3: Format %P: Character %3 cannot be converted with the code selected by MD 10750 / \$MN\_SPRINT\_FORMAT\_P\_CODE.  
4: Maximum string length of 400 bytes exceeded  
5: SPRINT/ISOPRINT command programmed with an invalid number of parameters  
6: SPRINT/ISOPRINT parameters programmed with impermissible data type  
7: Format %m.nP: overrange due to parameter n with MD 10751 / \$MN\_SPRINT\_FORMAT\_P\_DECIMAL = 0

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct SPRINT and/or ISOPRINT command(s).

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14066 [channel %1: ] block %2 error when outputting to external device on command %3, error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Part program command  
%4 = Error code

| <b>Explanation:</b>           | <p>In conditional and unconditional jumps, the jump destination within the program must be a block with a label (symbolic name instead of block number). If no jump destination has been found with the given label when searching in the programmed direction, an alarm is output.</p> <p>For parameterizable returns with RET to block number or label, the jump destination within the program must be a block with the block number or label (symbolic name instead of block number).</p> <p>For returns over several levels (parameter 2), the jump destination must be a block within the program level you jumped to.</p> <p>For returns with a string as return destination, the search string must be a name known in the control and the search string must be preceded in the block by a block number and/or a label only.</p> |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Remedy:</b>                | Check NC part program for the following possible errors: <ol style="list-style-type: none"> <li>1. Check whether the target designation is identical with the label.</li> <li>2. Is the jump direction correct?</li> <li>3. Has the label been terminated with a colon?</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

---

**14088 [Channel %1: ] Block %2 axis %3 doubtful position**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis name, spindle number

**Explanation:** An axis position larger than 3.40e+38 increments has been programmed. This alarm can be suppressed with bit11 in MD11410 \$MN\_SUPPRESS\_ALARM\_MASK.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify the part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14089 [Channel %1: ] Block %2 Function %3 is no longer supported.**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = String: function

**Explanation:** An obsolete function was programmed or triggered, which is no longer supported in the current software version. The function in question is named in parameter 3.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** COMPOS: Replace "COMPOS" with "COMPCAD" and check machine data: MD28070  
\$MC\_MM\_NUM\_BLOCKS\_IN\_PREP>=80, MD28520 \$MC\_MM\_MAX\_AXISPOLY\_PER\_BLOCK>=3, MD28530  
\$MC\_MM\_PATH\_VELO\_SEGMENTS>=5, MD28540 \$MC\_MM\_ARCLENGTH\_SEGMENTS>=10.  
COMPCURV: Replace "COMPCURV" with "COMPCAD" and check machine data: MD28070  
\$MC\_MM\_NUM\_BLOCKS\_IN\_PREP>=80, MD28520 \$MC\_MM\_MAX\_AXISPOLY\_PER\_BLOCK>=3, MD28530  
\$MC\_MM\_PATH\_VELO\_SEGMENTS>=5, MD28540 \$MC\_MM\_ARCLENGTH\_SEGMENTS>=10.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**14091 [Channel %1: ] Block %2 illegal function, index %3**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Index

**Explanation:** A function has been programmed or triggered which is not permitted in the current program context. The function in question is encoded in the "index" parameter:

Index == 1: "RET" command was programmed in the main program level  
Index == 2: Conflict between "Cancel level"/"Clear number of passes" and "Implicit GET"  
Index == 3: Conflict ASUB start immediately after selection of overstore (up to P3)  
Index == 4: MD10760 \$MN\_G53\_TOOLCORR = 1 : SUPA/G153/G53 programmed in G75  
Index == 5: POSRANGE command not programmed in synchronized action  
Index == 6: SIRELAY command not programmed in synchronized action  
Index == 7: GOTOF/GOTOB/GOTO command programmed with string variable in synchronized action.  
Index == 8: COA application "Cutting generator" not active  
Index == 9: Tool radius compensation active in G75  
Index == 10: Number of return levels too big, with RET (...xy) across several program levels  
Index == 11: The function is not implemented for this variable

| <b>Explanation:</b>           | One of the following programming errors has occurred: <ol style="list-style-type: none"> <li>1. The keyword WAITP(x) "Wait with the block change until the specified positioning axes has reached its end point", was used for an axis that is not a positioning axis.</li> <li>2. G74 "Reference point approach from the program" was programmed for a spindle. (Only axis addresses are permissible.)</li> <li>3. The keyword POS/POSA was used for a spindle. (For spindle positioning, keywords SPOS and SPOSA should be programmed.)</li> <li>4. If the alarm occurs for the function "Thread tapping without compensating chuck " (G331) the following reasons are conceivable: <ul style="list-style-type: none"> <li>- The master spindle is not in position-controlled operation.</li> <li>- Incorrect master spindle</li> <li>- Master spindle without encoder</li> </ul> </li> <li>5. An axis name that is no longer available has been programmed, e.g. when using axial variables as index. Or it was programmed as index NO_AXIS.</li> <li>6. If 14092 is output as note for alarm 20140 motion synchronized action: traverse the command axis, then the the following causes are possible: <ul style="list-style-type: none"> <li>- The axis is presently being traversed by the NC program.</li> <li>- An overlaid movement is active for the axis.</li> <li>- The axis is active as slave axis of a coupling.</li> <li>- An interpolation compensation such as a temperature compensation is active for the axis.</li> </ul> </li> <li>7. PRESETON/ PRESETONS were programmed for an unknown channel axis.</li> </ol> |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Block number, label</p>                                                                                                                                                                                                                                                                                                                                   |
| <b>Explanation:</b>           | The called function AXNAME - conversion of the transferred parameters of the STRING type to an axis name (return value) of the AXIS type - has not found this axis identifier in the machine data.                                                                                                                                                                                           |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | <p>Please inform the authorized personnel/service department. Check the transferred parameter (axis name) of the function AXNAME to determine whether a geometry, channel or machine axis of this name has been configured by means of the machine data:</p> <p>MD10000 \$MN_AXCONF_MACHAX_NAME_TAB</p> <p>MD20060 \$MC_AXCONF_GEOAX_NAME_TAB</p> <p>MD20080 \$MC_AXCONF_CHANAX_NAME_TAB</p> |
| <b>Programm continuation:</b> | <p>Select the transfer string in accordance with the axis name, and change the axis name in the machine data if necessary. (If a change of name is to take place via the NC part program, this change must first be validated by means of a "POWER-ON").</p> <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                         |

|                    |                                                                        |
|--------------------|------------------------------------------------------------------------|
| <b>14098</b>       | <b>[Channel %1: ] Block %2 conversion error: no valid number found</b> |
| <b>Parameters:</b> | <p>%1 = Channel number</p> <p>%2 = Block number, label</p>             |

|                               |                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The string is not a valid INT or REAL number.                                                                                                           |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                   |
| <b>Remedy:</b>                | Modify the part program. If it is an entry, you can check whether the string is a number with the predefined ISNUMBER function with the same parameter. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                    |

---

**14099 [Channel %1: ] Block %2 result in string concatenation too long**

|                               |                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                     |
| <b>Explanation:</b>           | The result of the string chaining returns a string which exceeds the maximum string length specified by the system.                 |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                               |
| <b>Remedy:</b>                | Adapt the part program. With the STRLEN function, you can query the size of the sum string before executing the chaining operation. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                |

---

**14102 [Channel %1: ] Block %2 polynomial degree greater than 5 programmed for orientation vector angle**

|                               |                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                    |
| <b>Explanation:</b>           | During polynomial interpolation for the orientation vector, a polynomial degree larger than 5 has been programmed. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                   |
| <b>Remedy:</b>                | Modify the part program.                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                   |

---

**14103 [Channel %1: ] Block %2 error %3 when calling function CORRTRAF0.**

|                    |                                                                    |
|--------------------|--------------------------------------------------------------------|
| <b>Parameters:</b> | %1 = Channel number<br>%2 = Block number, label<br>%3 = Error code |
|--------------------|--------------------------------------------------------------------|

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>An error occurred when the CORRTRAFO function was called. The error number specifies the cause of the error.</p> <p>Error numbers:</p> <p>1: No transformation active.</p> <p>2: The current active transformation is not an orientation transformation.</p> <p>3: The active orientation transformation was not defined with kinematic chains.</p> <p>10: The call parameter <code>_CORR_INDEX</code> is negative.</p> <p>11: The call parameter <code>_CORR_MODE</code> is negative.</p> <p>12: Invalid reference to the section of a partial chain (1st position of <code>_CORR_INDEX</code>). The value must not be greater than the number of orientation axes in the partial chain.</p> <p>13: Invalid reference to the orientation axis of a partial chain (1st position of <code>_CORR_INDEX</code>). The value must be less than the number of orientation axes in the partial chain.</p> <p>14: Invalid reference to a partial chain (10th position of <code>_CORR_INDEX</code>). Only the values 0 and 1 are permissible (reference to part or tool chain). This error number also occurs if the partial chain to which <code>_CORR_INDEX</code> refers, does not exist.</p> <p>15: In the section referred to with the parameter <code>_CORR_INDEX</code>, no correction element is defined(<code>\$NT_CORR_ELEM_P</code> or <code>\$NT_CORR_ELEM_T</code>).</p> <p>20: Invalid correction mode (1st position of <code>_CORR_MODE</code>). Only the values 0, 1, 8, and 9 are permissible.</p> <p>21: Invalid correction mode (10th and / or 100th position of <code>_CORR_MODE</code>). When reading a system variable, the 100th position must always be zero. When reading or writing an axis direction, only the one's position is permitted to be not equal to zero.</p> <p>30: The 100th position of <code>_CORR_MODE</code> is invalid. Only the values 0 and 1 are permissible.</p> <p>31: The 1000th position of <code>_CORR_MODE</code> is invalid. Only the values 0 and 1 are permissible.</p> <p>40: The direction vector to be taken over as the axis direction is the zero vector.</p> <p>41: In the correction of an offset vector, the deviation from the current value is greater than the maximum value set in setting data 41610 <code>\$SN_CORR_TRAFO_LIN_MAX</code> in at least one coordinate.</p> <p>42: In the correction of a direction vector, the angle deviation from the current direction is greater than the maximum value set in setting data 41611 <code>\$SN_CORR_TRAFO_DIR_MAX</code>.</p> <p>43: The attempt to write a system variable was rejected due to missing write authorization.</p> |

| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Block number, label</p>                                                                                                                                                       |
| <b>Explanation:</b>           | The interpolation type CP (G group code 49) is not permitted with an active static orientation transformation if linear and rotary axes have to interpolate simultaneously.                                      |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                  |
| <b>Remedy:</b>                | <p>Change the NC program:</p> <p>Activate dynamic orientation transformation.</p> <p>Change the G code for group 49.</p> <p>Execute linear and rotary axis movement successively rather than simultaneously.</p> |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                 |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14130</b>                  | <b>[Channel %1: ] Block %2 too many initialization values given</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | On assigning an array by means of SET, more initialization values than existing array elements have been specified in the program run.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | Reduce the number of initialization values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. | <b>Explanation:</b>           | <p>An error occurred during the activation of the orientable tool carrier with the stated number, whose geometry data are to be read from kinematic chains.</p> <p>The geometry data of a tool carrier are read from kinematic chains if bit0 is set in system data \$TC_CARR_KIN_CNTRL[n].</p> <p>The type of error is indicated more precisely by the number of the error code.</p> <p>Error code:</p> <ol style="list-style-type: none"> <li>1 No kinematic chain elements are available. Remedy: Machine data MD18880 \$MN_MM_MAXNUM_KIN_CHAIN_ELEM must not be equal to zero.</li> <li>2 An error occurred during the analysis of the kinematic machine model.</li> <li>3 The tool carrier has an invalid type. Only types "T", "P" and "M" (optionally in upper or lower case) are permissible.</li> <li>4 No tool chain was specified, this means that system data \$TC_CARR_KIN_TOOL_END[n] is empty. For tool carrier types "T" and "M", this system data must refer to a kinematic chain element.</li> <li>5 No part chain was specified, this means that system data \$TC_CARR_KIN_PART_END[n] is empty. For tool carrier types "P" and "M", this system data must refer to a kinematic chain element.</li> <li>6 The kinematic chain element to which the system data \$TC_CARR_KIN_TOOL_END[n] refers was not found.</li> <li>7 The kinematic chain element to which the system data \$TC_CARR_KIN_PART_END[n] refers was not found.</li> <li>8 The kinematic chain element to which the system data \$TC_CARR_KIN_TOOL_END[n] refers was found, but it has no connection to the ROOT element. Kinematic chain elements are only part of the valid machine model if they are connected to the ROOT element by references.</li> <li>9 The kinematic chain element to which system data \$TC_CARR_KIN_PART_END[n] refers was found, but it has no connection to the ROOT element. Kinematic chain elements are only part of the valid machine model if they are connected to the ROOT element by references.</li> <li>10 The kinematic chain element to which system data \$TC_CARR_KIN_TOOL_START[n] refers is not part of the kinematic chain that forms the connection between the ROOT element and the end point of the tool chain (\$TC_CARR_KIN_TOOL_END[n]).</li> <li>11 The kinematic chain element to which system data \$TC_CARR_KIN_PART_START[n] refers is not part of the kinematic chain that forms the connection between the ROOT element and the end point of the part chain (\$TC_CARR_KIN_PART_END[n]).</li> <li>12 The kinematic chain (tool chain) that forms the connection between the ROOT element and the end point of the tool chain (\$TC_CARR_KIN_TOOL_END[n]) contains too many elements.</li> <li>13 The kinematic chain (part chain) that forms the connection between the ROOT element and the end point of the part chain (\$TC_CARR_KIN_PART_END[n]) contains too many elements.</li> <li>14 The kinematic chain (tool chain) that forms the connection between the ROOT element and the end point of the tool chain (\$TC_CARR_KIN_TOOL_END[n]) contains too many rotary axes. With tool carrier type "T", a maximum of 2, with tool carrier type "M" a maximum of one rotary axis is permissible in this chain.</li> <li>15 The kinematic chain (part chain) that forms the connection between the ROOT element and the end point of the part chain (\$TC_CARR_KIN_PART_END[n]) contains too many rotary axes. With tool carrier type "P", a maximum of 2, with tool carrier type "M" a maximum of one rotary axis is permissible in this chain.</li> <li>16 The kinematic chain (tool chain) that forms the connection between the ROOT element and the end point of the tool chain (\$TC_CARR_KIN_TOOL_END[n]) does not contain any rotary axes. This chain must contain at least one rotary axis.</li> <li>17 The kinematic chain (part chain) that forms the connection between the ROOT element and the end point of the part chain (\$TC_CARR_KIN_PART_END[n]) does not contain any rotary axes. This chain must contain at least one rotary axis.</li> <li>18. The kinematic chain (tool chain) for the definition of the tool carrier contains an element of type "AXIS_LIN_VIRT", that is not permissible for a tool carrier ("virtual" linear axis).</li> <li>19. The kinematic chain (part chain) for the definition of the tool carrier contains an element of type "AXIS_LIN_VIRT", that is not permissible for a tool carrier ("virtual" linear axis).</li> <li>20. The kinematic chain (tool chain) for the definition of the toolcarrier contains an element of type "AXIS_ROT_VIRT", that is not permissible for a tool carrier ("virtual" rotary axis)).</li> <li>21. The kinematic chain (part chain) for the definition of the toolcarrier contains an element of type "AXIS_ROT_VIRT", that is not permissible for a tool carrier ("virtual" rotary axis)</li> </ol> |

| <b>Explanation:</b>           | An attempt was made to define a tool orientation by means of the active frame, which cannot be reached with the current tool carrier kinematics.<br>This behavior can be caused by the following: <ul style="list-style-type: none"> <li>- The two rotary axes of the tool carrier are not perpendicular to one another.</li> <li>- The tool carrier has less than two rotary axes;</li> <li>- Rotary axis positions must be set that violate the corresponding axis limitations.</li> </ul> An error code is output with the alarm, which specifies the cause in detail: <ul style="list-style-type: none"> <li>1: 1st rotary axis of the first solution violates the lower limit</li> <li>2: 1st rotary axis of the first solution violates the upper limit</li> <li>10: 2nd rotary axis of the first solution violates the lower limit</li> <li>20: 2nd rotary axis of the first solution violates the upper limit</li> <li>100: 1st rotary axis of the second solution violates the lower limit</li> <li>200: 1st rotary axis of the second solution violates the upper limit</li> <li>1000: 2nd rotary axis of the second solution violates the lower limit</li> <li>2000: 2nd rotary axis of the second solution violates the upper limit</li> <li>3: The required orientation cannot be set with the given axis configuration</li> </ul> Several of the error codes that indicate a violation of the axis limits can occur simultaneously<br>As, when an axis limit is violated, an attempt is made to reach a valid position within the permissible axis limits by adding or subtracting multiples of 360 degrees, it is - if this is not possible - not unequivocally defined whether the lower or upper axis limit has been violated. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remedy:</b>                | Modify the part program: <ul style="list-style-type: none"><li>- Use TCOABS instead of TCOFR.</li><li>- Activate a different frame.</li><li>- Change the tool carrier data.</li><li>- Change the machining plane G17-G19.</li></ul> If the alarm cannot be cleared and an additional alarm 14710 is generated at RESET, the machine data 20126 \$MC_TOOL_CARRIER_RESET_VALUE must be set to zero. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                  |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Invalid parameter of the orientable toolholder<br>%4 = Number of the orientable toolholder                                                                                                                                                                    |
| <b>Explanation:</b>           | The maximum permissible value of the fine correction in an orientable toolholder is limited by the MD20188 \$MC_TOCARR_FINE_LIM_LIN for linear variables, and by the MD20190 \$MC_TOCARR_FINE_LIM_ROT for rotary variables. The alarm can only occur if the SD42974 \$SC_TOCARR_FINE_CORRECTION is not equal to zero. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                                                                                                                                                                                                    |
| <b>Remedy:</b>                | Enter a valid fine correction value.                                                                                                                                                                                                                                                                                  |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                      |

---

|                     |                                                                                                                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14155</b>        | <b>[Channel %1: ] Block %2 invalid base frame definition for tool carrier offset</b>                                                                                                                            |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                 |
| <b>Explanation:</b> | If a tool carrier selection causes a change in the table offset, a valid base frame must be defined in order to store this offset. For more information see machine data MD20184 \$MC_TOCARR_BASE_FRAME_NUMBER. |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Interpreter stop<br>Interface signals are set.<br>Alarm display.                                                                                                            |

**Remedy:** You have the following possibilities of eliminating the error:  
 Change the part program.  
 Change MD20184 \$MC\_TOCARR\_BASE\_FRAME\_NUMBER.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

#### **14156 [Channel %1: ] Toolholder selection error at reset**

**Parameters:** %1 = Channel number

**Explanation:** The settings in MD20110 \$MC\_RESET\_MODE\_MASK require that an active orientable toolholder is maintained after the reset. This is done by deselecting the old orientable toolholder and then reselecting it with data that may have been modified. If an error occurs during the reselection, this alarm is issued (as a warning) and then an attempt is made to select the orientable toolholder in the initial setting. If this second attempt is successful, the reset cycle is continued without any further alarms.

Typically, the alarm only occurs when the old orientable toolholder has been selected with TCOFR, and its axis directions have been changed in such a way before the reset that a setting suitable for the associated frame is no longer possible. If there is another cause for the alarm, this results in an alarm also being issued when attempting to select in the initial setting. This is then also displayed in plain text.

**Reaction:** Alarm display.

**Remedy:** Check the program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

#### **14157 [Channel %1: ] Block %2 illegal interpolation type with MOVt**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** If MOVt is programmed, linear or spline interpolation (G0, G1, ASPLINE, BSPLINE, CSPLINE). must be active.

**Reaction:** Correction block is reorganized.  
 Interpreter stop  
 Interface signals are set.  
 Alarm display.

**Remedy:** Modify the program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

#### **14159 [Channel %1: ] Block %2 more than two angles programmed with ROTs or AROTs**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** Frame rotations are described using space angles with the language commands ROTs or AROTs. A maximum of two angles can be programmed.

**Reaction:** Correction block is reorganized.  
 Interpreter stop  
 Interface signals are set.  
 Alarm display.

**Remedy:** Modify the program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

#### **14160 [Channel %1: ] Block %2 tool length selection without geometry axis specification**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

|                               |                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | If variant C (tool length acts on the programmed axis) is activated by machine data MD20380 \$MC_TOOL_CORR_MODE_G43G44 for tool length compensation with H word and G43/G44 in ISO_2 mode, at least one geometry axis must be specified. |

| <b>Explanation:</b>           | <p>An error occurred during the activation of the CUTMOD or CUTMODK function. The type of error is more closely defined by the error code number:</p> <p>For errors with error codes less than 100, MD20125 \$MC_CUTMOD_ERR can be used to determine whether the error condition is to lead to the issue of an alarm, and whether the alarm is only to be displayed or also trigger a program stop. Errors with error codes greater than or equal to 100 always lead to a program stop.</p> <p>Error code:</p> <ol style="list-style-type: none"> <li>1 No valid cutting direction is defined for the active tool.</li> <li>2 The cutting edge angles (clearance angle and holder angle) of the active tool are both zero.</li> <li>3 The clearance angle of the active tool has an impermissible value (less than 0 degrees or greater than 180 degrees).</li> <li>4 The holder angle of the active tool has an impermissible value (less than 0 degrees or greater than 90 degrees).</li> <li>5 The tool tip angle of the active tool has an impermissible value (less than 0 degrees or greater than 90 degrees for cutting edge position 1-4 or if the tool tip is located in 3 quadrants).</li> <li>6 The cutting edge position - holder angle combination of the active tool is impermissible (with cutting edge positions 1 through 4, the holder angle must be greater than or equal to 90 degrees, with cutting edge positions 5 through 8, it must be less than or equal to 90 degrees).</li> <li>7 The tool tip is not located in the machining plane, and the angle GAMMA between the tool tip and machining plane exceeds the upper limit specified using setting data SD42998 \$SC_CUTMOD_PLANE_TOL.</li> <li>8 The cutting plate is not located in the machining plane. Angle ALPHA is greater than 1 degree. The angle ALPHA is the angle of rotation around the coordinate axis, which is perpendicular to both the axis of rotation of the angle BETA and the axis of rotation of the angle GAMMA (with G18 the X axis).</li> </ol> <p>100 The rotation matrix to be used for calculating the modification of the cutting edge position does not describe a pure rotation, that is it contains mirroring, scaling or shearing.</p> <p>101 When CUTMODK is activated, there is no valid orientation transformation active. A 5 or 6-axis transformation defined with kinematic chains must be active.</p> <p>102 The language command "CUTMODK" was called with an invalid parameter. Only the parameters "NEW", "CLEAR", "ON" and "OFF" are permitted.</p> |

| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Block number, label</p>                                                                                                                                                                                                                                                             |
| <b>Explanation:</b>           | <p>The value of the Hirth increment (in degrees) in at least one axis is not a divisor of the full angle. This can be a problem for the display if, for example, a negative solution, which matches the Hirth tooth system, is increased by 360 degrees. The result is no longer divisible by the Hirth increment.</p> |
| <b>Reaction:</b>              | <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                  |
| <b>Remedy:</b>                | <p>Set the angle of rotation to zero, or define the associated rotary axis.</p>                                                                                                                                                                                                                                        |
| <b>Programm continuation:</b> | <p>Clear alarm with the Delete key or NC START.</p>                                                                                                                                                                                                                                                                    |

|                     |                                                                                                                                                                                                                                                                          |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14165</b>        | <b>[Channel %1: ] Block %2 selected ISO H/D number %3 does not match tool %4</b>                                                                                                                                                                                         |

| <b>Explanation:</b>               | An error occurred while programming a tool length offset with TOFF or TOFFL. More precise information about the type of error is given by the error code number:<br>Error code<br>1 At least one tool length offset component has been programmed twice in one block (with TOFF).<br>2 At least one tool length offset component has been programmed twice in one block (with TOFFL).<br>3 Tool length offset components have been programmed in one block with both TOFF and TOFFL.<br>4 An index must be declared when a tool length offset is programmed with TOFF, the form TOFF=.... is not permissible.<br>5 An illegal index was declared when programming TOFFL (permissible values 1..3).<br>6 An illegal axis was declared as the index when programming TOFF. Only geometry axes are permitted. Can also occur with TRAFOOF if TOFFON is active and no geometry axes are known without transformation. |
| <b>Reaction:</b>                  | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

#### 14260 [Channel %1: ] Block %2 pole angle too large

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>           | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>          | In redefining the pole with G110, G111 or G112 in polar coordinates, the value range of the pole angle specified under keyword AP=... has been exceeded. It covers the range from -360 to +360 degrees with a resolution of 0.001 degrees.<br>Definition of terms:<br>- Specification of end of block point with polar angle and polar radius, referring to the current pole (preparatory functions: G00/G01/G02/G03).<br>- New definition of the pole with polar angle and pole radius, referring to the reference point selected with the G function. G110 ... last programmed point in the plane, G111 ... zero point of the current work, G112 ... last pole |
| <b>Reaction:</b>             | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>               | Correct NC part program. The permissible input range for the polar angle is between the values -360 degrees and +360 degrees with a resolution of 0.001 degrees.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Program continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                               |                                                                                                                                                                                                                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14270</b>                  | <b>[Channel %1: ] Block %2 pole programmed incorrectly</b>                                                                                                                                                                                                              |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                         |
| <b>Explanation:</b>           | When defining the pole, an axis was programmed that does not belong to the selected processing level. Programming in polar coordinates always refers to the plane activated with G17 to G19. This also applies to the definition of a new pole with G110, G111 or G112. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                        |
| <b>Remedy:</b>                | Correct the NC part program. Only the two geometry axes may be programmed that establish the current machining plane.                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                        |

|                               |                                                                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14280</b>                  | <b>[Channel %1: ] Block %2 polar coordinates programmed incorrectly</b>                                                                                                              |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                      |
| <b>Explanation:</b>           | The end point of the displayed block has been programmed both in the polar coordinate system (with AP=..., RP=...) and in the Cartesian coordinate system (axis addresses X, Y,...). |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                     |
| <b>Remedy:</b>                | Correct the NC part program - the axis motion may be specified in one coordinate system only.                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                     |

|                               |                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14290</b>                  | <b>[Channel %1: ] Block %2 polynomial degree greater than 5 programmed for polynomial interpolation</b>                                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                               |
| <b>Explanation:</b>           | A polynomial degree greater than five was programmed for the polynomial interpolation. You can only program polynomials up to the 5th degree. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                              |
| <b>Remedy:</b>                | Modify part program.                                                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                              |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**14400 [Channel %1: ] Block %2 tool radius compensation active at transformation switchover**

|                               |                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                          |
| <b>Explanation:</b>           | A change of transformation is not allowed when tool radius compensation is active.                                                       |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                         |
| <b>Remedy:</b>                | Perform tool radius compensation in the NC part program with G40 (in a block with G00 or G01) before performing a transformation change. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                         |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Explanation:</b>           | <p>An error was detected during the attempt to activate a transformation. The cause of the error is indicated more precisely by the following error code.</p> <ul style="list-style-type: none"> <li>- 80. The geometry axes are (almost) linearly dependent. This means that two geometry axes are almost parallel or three geometry axes lie almost in one plane.</li> <li>- 81. An orientation axis is impermissible or not completely parameterized as a spindle (with \$NT_CNTRL, \$NT_ROT_AX_CNT).</li> <li>- 90. More than one inclined axis was parameterized in the definition of a TRANSMIT or TRACYL transformation with kinematic chains.</li> <li>- 91. Impermissible direction of an inclined axis in the definition of a TRANSMIT or TRACYL transformation with kinematic chains. The inclined axis does not lie in a main plane.</li> <li>- 92. The polar axis and the longitudinal axis are not parallel in a TRANSMIT or TRACYL transformation.</li> <li>- 93. The radial axis must be perpendicular to the polar axis if no longitudinal axis is present.</li> <li>- 94. The center offset axis must be perpendicular to the polar axis if no longitudinal axis is present.</li> <li>- 120. During the redirection of a TRAANG transformation to a transformation defined by kinematic chains, a parameter was stated as an angle that was not the same as the angle defined by the kinematic chains.</li> <li>- 121. During the redirection of a TRAANG transformation to a transformation defined by kinematic chains, a parameter was stated as an angle, although the angle of the inclined axis was not defined. This case occurs if there is more than one inclined axis or if the inclined axis does not lie in a main plane.</li> <li>- 150. The call of a TRACYL transformation did not state a value for the reference or work diameter.</li> <li>- 200. The transformation can only be activated in a transformation chain, and not as a single transformation.</li> <li>- 250. The spindle rotation vector is not parallel to the Z axis of the WCS (see \$NT_P_CHAIN_LAST_ELEM). The element to be entered here must be the last element in the table chain that is not a rotary axis. (If the part of the table chain before \$NT_P_CHAIN_LAST_ELEM contains rotary axes, WKS jumps will occur, which (as described above) violate the prerequisites for activation).</li> <li>- 251. The tool is oriented incorrectly. The tool must point to the center of rotation when TRAJNT is called.</li> </ul> <p>*****</p> <p>The following error codes are only output with OEM transformations if an error is detected during the selection of the transformation:</p> <ul style="list-style-type: none"> <li>- 1000. The basic direction of the tool orientation must be parallel to one of the coordinate axes X, Y or Z.</li> <li>- 1001. The basic direction of the tool orientation must not point in the X direction.</li> <li>- 1002. The basic direction of the tool orientation must not point in the Y direction.</li> <li>- 1003. The basic direction of the tool orientation must not point in the Z direction.</li> <li>- 1004. The normal vector of the tool in the basic position must be parallel to one of the coordinate axes X, Y or Z.</li> <li>- 1005. The normal vector of the tool in the basic position must not point in the X direction.</li> <li>- 1006. The normal vector of the tool in the basic position must not point in the Y direction.</li> <li>- 1007. The normal vector of the tool in the basic position must not point in the Z direction.</li> </ul> <p>Note: Error codes 1000 to 1007 can only occur if \$NC_IGNORE_TOOL_ORIENT = FALSE (default value), and the active tool contains orientations that are not permissible.</p> <p>In this case, basic directions defined in the variables \$NT_BASE_ORIENT and \$NT_BASE_ORIENT_NORMAL do not become active</p> |

|                     |                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                       |
| <b>Explanation:</b> | It is not permissible to change the assignment of geometry axes to channel axes during active tool fine compensation. |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                      |
| <b>Remedy:</b>      | Modify the part program.                                                                                              |

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

#### **14414 [Channel %1: ] Block %2 GEOAX function: incorrect call**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The parameters for calling the GEOAX(...) are incorrect.  
Possible causes:

- Uneven number of parameters.
- More than 6 parameters were specified.
- A geometry axis number was programmed which was less than 0 or greater than 3.
- A geometry axis number was programmed more than once.
- An axis identifier was programmed more than once.
- An attempt was made to assign a channel axis to a geometry axis which has the same name as one of the channel axes.
- An attempt was made to assign a channel axis to a geometry axis lacking IPO functionality (see MD30460 \$MA\_BASE\_FUNCTION\_MASK, Bit8).
- An attempt was made to remove a geometry axis with the same name as one of the channel axes from the geometry axis grouping.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify the part program or the correction block.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

#### **14415 [Channel %1: ] Block %2 tangent control: changeover geometry/channel axis not allowed**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** An assignment change of the geometry axes to channel axes is not permitted with active tangential control.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Change part program and delete active tangential control with TANGDEL.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

#### **14420 [Channel %1: ] Block %2 index axis %3 frame not allowed**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis

**Explanation:** The axis is to be traversed as an indexing axis, but a frame is active. This is not allowed by MD32074 \$MA\_FRAME\_OR\_CORRPOS\_NOTALLOWED.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Inform the authorized personnel/service department.  
Modify the part program.  
Change MD32074 \$MA\_FRAME\_OR\_CORRPOS\_NOTALLOWED.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

|                               |                                                                                                                                                                                                                                                                                          |

**14520 [Channel %1: ] Block %2 illegal PROC instruction in data definition section**

|                               |                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                  |
| <b>Explanation:</b>           | The PROC statement may only be programmed at the beginning of the subroutine.    |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Modify NC part program appropriately.                                            |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                 |

---

**14530 [Channel %1: ] Block %2 EXTERN and PROC instruction do not correspond**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | Subroutines with parameter transfer must be known before they are called in the program. If the subroutines are always available (fixed cycles) the control establishes the call interfaces at the time of system power-up. Otherwise an EXTERN statement must be programmed in the calling program.<br>Example:<br>N123 EXTERN UPNAME (TYP1, TYP2, TYP3, ...)<br>The type of the variable must match the type given in the definition (PROC statements) or it must be compatible with it. The name can be different. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | Check the variable types in the EXTERN and the PROC statements for correspondence and correctness.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                               |                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14540</b>                  | <b>[Channel %1: ] Block %2 contour tool: the min. limit angle has been programmed more than once (edge D%3)</b>                                        |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Edge number, label                                                                             |
| <b>Explanation:</b>           | The limit angle of a contour tool must be unequal zero in an involved edge only.                                                                       |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.            |

|                                   |                                                                                                                                                                                           |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14544</b>                      | <b>[Channel %1: ] Block %2 contour tool: edge D%3 is not positioned between the two border edges</b>                                                                                      |
| <b>Parameters:</b>                | %1 = Channel number<br>%2 = Block number, label<br>%3 = Edge number, label                                                                                                                |
| <b>Explanation:</b>               | On defining a form tool with limit, all edges must be positioned between the edge with the minimum limit angle and the edge with the maximum limit angle when rotating counter-clockwise. |
| <b>Reaction:</b>                  | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                                               |
| <b>Remedy:</b>                    | Change tool definition.                                                                                                                                                                   |
| <b>Programm<br/>continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                          |

---

|                                   |                                                                                                                                                              |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14545</b>                      | <b>[Channel %1: ] Block %2 contour tool: edge D%3 completely encircles edge D%4</b>                                                                          |
| <b>Parameters:</b>                | %1 = Channel number<br>%2 = Block number, label<br>%3 = Edge number, label<br>%4 = Edge number, label                                                        |
| <b>Explanation:</b>               | On defining a contour tool, tangents are placed on the adjacent circular edges. It will not be possible, if one edge is completely encircled by another one. |
| <b>Reaction:</b>                  | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end.                  |
| <b>Remedy:</b>                    | Change tool definition.                                                                                                                                      |
| <b>Programm<br/>continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                             |

---

|                     |                                                                                                                                             |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14546</b>        | <b>[Channel %1: ] Block %2 contour tool: edge D%3 defines a concave corner</b>                                                              |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label<br>%3 = Edge number, label                                                                  |
| <b>Explanation:</b> | The contour of a contour tool must be convex throughout, i.e. there must not be any concave corners.                                        |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm at block end. |

**Remedy:** Change tool definition.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14547 [Channel %1: ] Block %2 contour tool: checksum erroneous or not available**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** When MD20372 \$MC\_SHAPED\_TOOL\_CHECKSUM was set, no edge was found for which the tool length components and the tool radius equal the negative sum of the previous edges.

**Reaction:** Correction block is reorganized.  
 Local alarm reaction.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm at block end.

**Remedy:** Check tool definition. An edge must exist, the tool length components and tool radius of which equal the negative sum of the previous edges. This will not take the tool length components of the first edge into consideration. On comparing the components, the relevant sums of basic value and wear value are compared with each other, not the part components themselves.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14548 [Channel %1: ] Block %2 contour tool: negative radius in edge D%3 is not allowed**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Edge number, label

**Explanation:** No negative radii are permitted for contour tools, i.e. the sum of basic radius and wear value must be at least 0.

**Reaction:** Correction block is reorganized.  
 Local alarm reaction.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm at block end.

**Remedy:** Check tool definition. Change edge radius.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14549 [Channel %1: ] Block %2 contour tool: impermissible programming. Code no. %3**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Error code

**Explanation:** Impermissible programming has been found for contour tools on active tool radius compensation. The error cause is explained in detail by the error code.

- 1: In G code group 17, KONT is active during activation
- 2: In G code group 17, KONT is active during deactivation
- 9: In G code group 40, CUTCONOF is not active
- 10: Reprogramming of G41 / G42 in already active tool radius compensation not permissible
- 20: Circle with more than one rotation not permissible
- 21: Ellipse (circle not in compensation level)
- 23: Involute not permissible
- 24: Several polynomials not permitted in one block only. These blocks could be created by e.g. COMPCAD or G643.
- 30: Preprocessing stop not permitted
- 41: Starting point of first compensation block cannot be reached by anyone of the defined cutting edges
- 42: End point of last compensation block cannot be reached by anyone of the defined cutting edges

|--------------------|-------------------------------------------------------------------|

|                               |                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The download buffer for "execute from external" could not be created. Possible causes:<br>- Not enough memory available (for minimum see MD18360 \$MN_MM_EXT_PROG_BUFFER_SIZE)<br>- No resources available for HMI NCK communication (see MD18362 \$MN_MM_EXT_PROG_NUM)<br>- The file already exists |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                |
| <b>Remedy:</b>                | - Release memory, e.g. by deleting part programs<br>- Modify MD18360 \$MN_MM_EXT_PROG_BUFFER_SIZE and/or MD18362 \$MN_MM_EXT_PROG_NUM.                                                                                                                                                               |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                 |

---

|                               |                                                                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14601</b>                  | <b>[Channel %1: ] Block %2 reload buffer could not be deleted</b>                                                                            |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                              |
| <b>Explanation:</b>           | The reload buffer for "Execute from external" could not be deleted because, for example, communication with HMI/PLC had not been terminated. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                        |
| <b>Remedy:</b>                | To clear all reload buffers, perform a power on.                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                         |

---

|                               |                                                                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14602</b>                  | <b>[Channel %1: ] Block %2 timeout while reloading from external.</b>                                                                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                       |
| <b>Explanation:</b>           | No connection could be made to the HMI while reloading EXTCALL external subprograms or executing from external drives within the monitoring time set in MD10132 \$MN_MMC_CMD_TIMEOUT. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                 |
| <b>Remedy:</b>                | - Check the connection to the HMI<br>- Increase the monitoring time in MD10132 \$MN_MMC_CMD_TIMEOUT.                                                                                  |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                  |

---

|                     |                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14603</b>        | <b>[Channel %1: ] Block %2 timeout during execution from external source.</b>                                                                                                                                                                                                                                                                                      |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b> | If a program is selected for execution from an external source, it is assumed that the first part program line can be read from the reload buffer within 60s after the part program has started.<br>Otherwise, part program processing will be canceled with alarm 14603 based on the assumption that the connection to the HMI or the external device is faulted. |
| <b>Reaction:</b>    | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                              |

**Remedy:** Check the connection to the HMI and repeat selection of the program that is to be executed from external source.

**Programm** Clear alarm with the RESET key. Restart part program

**continuation:**

- Acknowledge the alarm by pressing the RESET key
- Repeat program selection
- Start the part program

---

**14615 [Channel %1: ] An error occurred while handling the function 'syntax check': identifier %3**

**Parameters:**

%1 = Channel number  
%2 = Is not used  
%3 = Error code

**Explanation:** An error occurred while handling the function syntax check via the PI services \_N\_CHKSEL, \_N\_CHKRUN, \_N\_CHKABO and \_N\_SEL\_BL. Parameter %3 describes the error situation more closely:

Value

1: An invalid line number was transferred with the PI service \_N\_SEL\_BL

2: An invalid line number for the range end was transferred with the PI service \_N\_CHKRUN

3: PI service \_N\_CHKSEL was activated although a block selection (PI service \_N\_SEL\_BL) was active for the selected program.

**Reaction:** Alarm display.

**Remedy:** Value

1: Supply PI service \_N\_SEL\_BL with the correct line number

2: Supply PI service \_N\_CHKRUN with the correct line number for the range end

3: Ensure that the channel is in reset status before activating the PI service \_N\_CHKSEL.

**Programm** Clear alarm with the Delete key or NC START.

**continuation:**

---

**14620 [Channel %1: ] Block %2 Error on opening program %3**

**Parameters:**

%1 = Channel number  
%2 = Block number, label  
%3 = Program name

**Explanation:** Program %3 cannot be executed because it has been locked by another application, e.g. HMI Editor.

Background: Program %3 is stored on an external data medium (CF Card, network drive, USB device), and should be executed from there in EES mode (execution from external storage). However, program %3 cannot be edited because it is locked by another application, e.g. HMI Editor, is open for writing and WRITE lock is set for this file.

**Reaction:**

Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

- Cancel program with Reset
- Close the application that set the WRITE lock, for example the HMI Editor, and continue program editing with NC Start.

**Programm** Clear alarm with the RESET key. Restart part program

**continuation:**

---

**14621 [Channel %1: ] Block %2 Timeout on access to external program %3**

**Parameters:**

%1 = Channel number  
%2 = Block number, label  
%3 = Program name

**Explanation:** Program %3 is stored on an external data medium (CF card, network drive, USB device). A timeout occurred when the program was accessed.

Possible cause of error: network disturbance.

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | - Rectify network disturbances if applicable                                                          |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

#### **14622 [Channel %1: ] Access to file %2 disrupted by %3 %4**

|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14701</b>                  | <b>[Channel %1: ] Block %2 number of available NC blocks reduced by %3</b>                                                                                                                                                                                                                                                                              |
| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Block number, label</p> <p>%3 = Number of non-available blocks</p>                                                                                                                                                                                                                                                   |
| <b>Explanation:</b>           | After the reset, it was found that the number of available blocks has decreased compared with the last reset. This is due to a system error. The part program execution can be resumed after acknowledging the alarm. If the number of blocks no longer available is less than MD28060 \$MC_MM_IPO_BUFFER_SIZE, then the PowerON alarm 14700 is output. |
| <b>Reaction:</b>              | <p>Interpreter stop</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b> | <p>Initialization blocks are generated (or not) after control power-up, (program) RESET and (program) START, depending on the settings in machine data MD20110 \$MC_RESET_MODE_MASK and MD20112 \$MC_START_MODE_MASK.</p> <p>Errors can occur because of incorrect machine data settings. The errors are output with the same error messages as would appear if the function had been incorrectly programmed in the part program.</p> <p>This alarm is also generated in order to indicate that an error relates to the initialization sequence.</p> <p>Parameter %3 specifies which function triggers the alarm:</p> <p>Control power-up and (program) RESET:</p> <p>Value:</p> <p>0: Error during synchronization preprocessing/main run</p> <p>1: Error on selection of tool length compensation</p> <p>2: Error on selection of transformation</p> <p>3: Error on selection of work offset</p> <p>The macro definitions and cycle interfaces are also read in during the power-up procedure. If an error occurs here, this is indicated by value = 4, or value = 5</p> <p>6: Error creating 2 1/2 D protection areas during power up.</p> <p>(Program) START:</p> <p>Value</p> <p>100: Error during synchronization preprocessing/main run</p> <p>101: Error on selection of tool length compensation</p> <p>102: Error on selection of transformation</p> <p>103: Error on selection of synchronized spindle</p> <p>104: Error on selection of work offset</p> <p>105: Error after WRITE lock on the selected program</p> <p>Particularly when tool management is active, it is possible that a tool on the spindle or the toolholder is disabled but still needs to be activated.</p> <p>These tools are automatically activated on RESET. On START, machine data MD22562 \$MC_TOOL_CHANGE_ERROR_MODE can be used to specify whether an alarm is to be generated or an automatic bypass strategy selected.</p> <p>If the parameter contains 3 values from 200 to 203, this means that an insufficient number of NC blocks is available for NC block preparation on certain commands (ASUB start, overstore selection, teach-in).</p> <p>Remedy: Increase machine data MD28070 \$MC_MM_NUM_BLOCKS_IN_PREP.</p> |
| <b>Reaction:</b>    | <p>Interpreter stop</p> <p>Channel not ready.</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                               |                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14711</b>                  | <b>[Channel %1: ] Transformation selection not possible as axis %2 not available</b>                                                                                                                                                                                                                                                        |
| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Axis name, spindle number</p>                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | Based on the configuration of machine data MD20110 \$MC_RESET_MODE_MASK and MD20140 \$MC_TRAFO_RESET_VALUE, a transformation shall be selected by performing a reset or control ramp-up. However, this is not possible as axis %2 required for this is not available. Possible reason: The axis was occupied by another channel or the PLC. |
| <b>Reaction:</b>              | <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                     |

**14750 [Channel %1: ] Block %2 too many auxiliary functions programmed**

|                               |                                                                                                                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Block number, label</p>                                                                                                                                                      |
| <b>Explanation:</b>           | <p>More than 10 auxiliary functions have been programmed in an NC block.</p>                                                                                                                                    |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                 |
| <b>Remedy:</b>                | <p>Check whether all auxiliary functions are necessary in one block - modal functions need not be repeated. Create separate auxiliary function block or divide the auxiliary functions over several blocks.</p> |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                         |

---

**14751 [Channel %1: ] Block %2 resources for motion synchronous actions not sufficient (code: %3)**

|                    |                                                                                   |
|--------------------|-----------------------------------------------------------------------------------|
| <b>Parameters:</b> | <p>%1 = Channel number</p> <p>%2 = Block number, label</p> <p>%3 = Identifier</p> |
|--------------------|-----------------------------------------------------------------------------------|

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | Processing of motion-synchronous actions requires resources that are configured using MD28060 \$MC_MM_IPO_BUFFER_SIZE, MD28070 \$MC_MM_NUM_BLOCKS_IN_PREP, MD28251 \$MC_MM_NUM_SAFE_SYNC_ELEMENTS, MD28250 \$MC_MM_NUM_SYNC_ELEMENTS, and MD28253 \$MC_MM_NUM_SYNC_STRINGS. If these resources are insufficient for the execution of the part program, then this alarm is issued. Parameter %3 shows which resource has run out:<br>Increase identifier <= 2: MD28060 \$MC_MM_IPO_BUFFER_SIZE or MD28070 \$MC_MM_NUM_BLOCKS_IN_PREP.<br>Increase identifier > 2: MD28250 \$MC_MM_NUM_SYNC_ELEMENTS, MD28251 \$MC_MM_NUM_SAFE_SYNC_ELEMENTS.<br>Increase identifier 7: MD28253 \$MC_MM_NUM_SYNC_STRINGS. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | Correct part program or increase resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

---

|                               |                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14752</b>                  | <b>[Channel %1: ] Block %2 DELDTG   STOPREOF conflict</b>                                                                                                         |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                   |
| <b>Explanation:</b>           | In a group of motion synchronous actions referring to a motion block, both DELDTG (delete distance-to-go) and STOPREOF (preprocessing stop) have been programmed. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                  |
| <b>Remedy:</b>                | The functions DELDTG and STOPREOF exclude each other in a block.                                                                                                  |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                  |

---

|                               |                                                                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14753</b>                  | <b>[Channel %1: ] Block %2 motion synchronous action: %3 illegal interpolation type</b>                                                         |

**14758 [Channel %1: ] Block %2 programmed value not available**

|                     |                                                                                                                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                        |
| <b>Explanation:</b> | The synchronous variables \$AA_LOAD, \$AA_TORQUE, \$AA_POWER and \$AA_CURR are activated by the MD36730 \$MA_DRIVE_SIGNAL_TRACKING. The system variable \$VA_IS: Safe actual position is only available if the MD36901 \$MA_SAFE_FUNCTION_ENABLE is set and the option \$ON_NUM_SAFE_AXES is set to a sufficient size. |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                       |

**Remedy:** Modify program or machine data.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

|                               |                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14760</b>                  | <b>[Channel %1: ] Block %2 auxiliary function of a group programmed repeatedly</b>                                                                                                                                                                                                          |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                             |
| <b>Explanation:</b>           | The M and H functions can be divided up as required over machine data in groups in any variation. Auxiliary functions are thus put into groups that mutually preclude several individual functions of one group. Within one group only one auxiliary function is advisable and permissible. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                            |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Only program one help function per help function group. (For the group division, see the machine manufacturer's programming guide).                                                                                              |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                            |

---

|                               |                                                                                                                                                                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14761</b>                  | <b>[Channel %1: ] Block %2 motion synchronous action: DELDTG function not allowed with active tool radius compensation</b>                                                                                                              |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                         |
| <b>Explanation:</b>           | Rapid delete distance-to-go for synchronous actions is not allowed with DELDTG when tool radius compensation is active.                                                                                                                 |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                        |
| <b>Remedy:</b>                | You have the following possibilities of eliminating the error:<br>Select the tool radius compensation before performing rapid delete distance-to-go, and then reselect.<br>As from SW 4.3: "Delete distance-to-go without preparation". |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                        |

| <b>Explanation:</b>           | A maximum of 5 auxiliary functions of type "M" may be entered in an NC block. The upper limit is the total of programmed and implicitly generated M auxiliary functions. Implicit auxiliary functions M19 and M70 are generated, if in MD35035 \$MA_SPIND_FUNCTION_MASK, bit 19 has been set for M19 and/or bit 20 for M70. M19 is generated with SPOS and SPOSA depending on the configuration. The same applies to M70 and transition into axis operation. The address extension corresponds to the spindle number like it is output to the PLC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Explanation:</b>           | For the function "Constant cutting speed G96" a maximum spindle speed can be programmed with the keyword LIMS=.... The values are in the range 0.1 - 999 999.9 [rev/min].                                                                                                                                                                                                                                                    |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | Program the maximum spindle speed for the constant cutting speed within the limits given above. The keyword LIMS is modal and can either be placed in front of or within the block that selects the constant cutting speed.                                                                                                                                                                                                  |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                             |
| <hr/>                         |                                                                                                                                                                                                                                                                                                                                                                                                                              |
