| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                            |
| <b>Remedy:</b>                | Program cutting speed under address S within the permissible range of values.                                                                               |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                            |

---

**14850 [Channel %1: ] Block %2 changing the reference axis for a constant cutting speed not allowed**

|                               |                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                               |
| <b>Explanation:</b>           | The attempt was made via the SCC[AX] instruction to change the reference axis for a constant cutting speed.<br>This is not allowed if the indicated axis is no geometry axis. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.                                                                     |
| <b>Remedy:</b>                | Please inform authorized personnel/service.<br>When programming SCC[AX] indicate a geometry axis known in the channel.                                                        |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                              |

---

**14860 [Channel %1: ] Block %2 Selection of the tool cutting speed not allowed. Cause %3**

|                               |                                                                                                                                                                                                                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Cause of the error                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | Selection of the cutting speed SVC is not permissible in the current state<br>Causes of the problem: the following function is active.<br>1: Constant cutting speed G96, G961 or G962 active<br>2: SPOS/SPOSA/M19 (spindle positioning mode) active<br>3: M70/axis mode active<br>4: SUG active |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                       |
| <b>Remedy:</b>                | Activate the speed control mode for the spindle prior to programming SVC, for example with M3, M4 or M5.                                                                                                                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                |

---

**14861 [Channel %1: ] Block %2 SVC programmed, but no tool offset active**

|                     |                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                           |
| <b>Explanation:</b> | Cutting speed SVC programmed in the block, but no tool offset active.                                     |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Local alarm reaction.<br>Interface signals are set.<br>Alarm display. |

**Remedy:** Select an appropriate tool prior to the SVC instruction.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14862 [Channel %1: ] Block %2 SVC has been programmed, but the radius of the active tool correction is zero**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** A cutting speed SVC has been programmed in the block, but the radius of the active tool offset is zero.  
The radius of the active tool offset consists of the offset parameters \$TC\_DP6, \$TC\_DP12, \$TC\_SCPx6 and \$TC\_ECPx6.

**Reaction:** Correction block is reorganized.  
Local alarm reaction.  
Interface signals are set.  
Alarm display.

**Remedy:** Select an appropriate tool offset with a positive tool radius prior to the SVC instruction.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14863 [Channel %1: ] Block %2 The programmed SVC value is zero or negative**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The programmed value for the cutting speed SVC is zero or negative.

**Reaction:** Correction block is reorganized.  
Local alarm reaction.  
Interface signals are set.  
Alarm display.

**Remedy:** Program an SVC value larger than zero.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14900 [Channel %1: ] Block %2 center point and end point programmed simultaneously**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** When programming a circle by means of the opening angle, the circle center point was programmed together with the circle end point. This is too much information for the circle. Only one of the two points is allowed.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Select the programming variant guaranteeing that the dimensions are definitely taken over from the workpiece drawing (avoidance of calculation errors).  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14910 [Channel %1: ] Block %2 invalid angle of aperture for programmed circle**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** When programming a circle by means of the opening angle, a negative opening angle or an opening angle greater than or equal to 360 degrees has been programmed.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Program opening angle within the allowed range of values between 0.0001 and 359.9999 [degrees].  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**14920 [Channel %1: ] Block %2 intermediate point of circle incorrect**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** When programming a circle by means of an intermediate point (CIP) all 3 points (initial, end and intermediate points) are on a straight line and the intermediate point (programmed by means of interpolation parameters I, J, K) is not located between the initial and end points.  
 If the circle is the component of a helix, the specified number of turns (keyword TURN=...) determines further block processing:  
 - TURN>0: alarm display because the circle radius is infinitely great.  
 - TURN=0 and CIP specified between initial and end points. A straight line is generated between the initial and end points (without alarm message).

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Locate the position of the intermediate point with the parameters I, J and K in such a way that it actually is located between the initial and end points of the circle or do not make use of this type of circle programming and instead program the circle with radius or opening angle or center point parameters.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**15000 [Channel %1: ] Block %2 channel-sync command using illegal marker**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** A WAITM/WAITMC/SETM/CLEARM instruction was programmed with a marker number of less than 1 or greater than the maximum number of markers.  
 Exception: CLEARM(0) is allowed and clears all markers in the channel!

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Correct the instruction accordingly.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**15010 [Channel %1: ] Block %2 program coordination instruction with invalid channel number**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** A WAITM, WAITMC, INIT or START instruction was programmed with an invalid channel number.

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Correct the instruction accordingly.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**15020 [Channel %1: ] block %2 CHANDATA instruction cannot be executed. Channel %3 is not active**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = String (CHANDATA parameter)

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | With a CHANDATA instruction, the data input for a channel is selected that has not been activated. For structural reasons, the input of multi-channel data must take place twice.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department.<br>- Activate the channel concerned by means of machine data or option data or<br>- Delete the CHANDATA instruction and all following assignments to channel data. This error message occurs regularly when first reading in an INITIAL Init block with which a multi-channel system is to be installed. In this case:<br>1. NCK Restart must be executed in order to activate the global machine data already input for the installation of the other channels.<br>2. Input of the INITIAL Init block must be repeated. |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

---

|                               |                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>15021</b>                  | <b>[Channel %1: ] Block %2 CHANDATA instruction with invalid channel number</b>                                                     |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                     |
| <b>Explanation:</b>           | A CHANDATA instruction is used to enter data for an illegal channel, e. g. <1,> maximum number of channels, not the active channel. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                               |
| <b>Remedy:</b>                | Program CHANDATA instruction in accordance with the actual configuration.                                                           |

| <b>Remedy:</b>                | This is an informational alarm referring to the fact that the file loaded into the NCK contains data of an inactive channel. The number of the inactive channel is specified. Subsequently, the data of this channel are not available in the NCK.<br>The alarm may have two causes:<br>(1) The channel is supposed to be activated by a following NCK RESET/POWER ON, i.e. the file must subsequently be reloaded. If the alarm occurs again, the reason is: (2) the specified channel is actually not supposed to be activated, however, the file contains the relevant data.<br>For the 2nd reason, please check whether the system has correctly not activated the channel mentioned.<br>If the channel has been activated, operation may be continued after another NCK RESET/POWER ON without further measures, i.e. reloading the file is not required. If the channel has not been activated, make sure that the channel inactivated by mistake is re-activated.<br>If the settings of the channel activation are part of the file to be loaded (e.g. archive file), the file must either be modified with the relevant program or the file has to be created once more in the same system with the correct channel number.<br>Similar alarms: 15020, 15021. |

| <b>Explanation:</b>           | The INCH or METRIC instruction describes the system of measurement in which the data sets have been read from the control. In order to prevent the incorrect interpretation of data intended for a particular system of measurement, a data block is only accepted if the above instruction matches the active system of measurement.                                                                                                                                                                                |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | Change the measuring system or load a data block that matches the measuring system setting.                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Explanation:</b>           | In order to synchronize the preprocessing run and the main run with REORG, the control accesses modification data which are maintained in a logfile. The alarm indicates that no more capacity is available in the logfile for the specified block in the channel.<br><br>The alarm message means that the logfile has been deleted in order to obtain additional memory for program reorganization. Consequently, it is no longer possible to REORG the preprocessing memory up to the next coincidence point.      |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. No remedial measures are available for the further execution of the current part program, however:<br>1. Reduce log file size requirement by:<br>Reducing the distance between the preprocessing and the main run via appropriate preprocessing stops (STOPRE).<br>2. Increase the size of the logfile by means of the channel-specific machine data:<br>Modify MD28000 \$MC_MM_REORG_LOG_FILE_MEM and<br>Modify MD MD28010 \$MC_MM_NUM_REORG_LUD_MODULES |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. |-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>Execution from external was canceled because the reload buffer does not have enough machine function blocks (traversing blocks, auxiliary function, dwell time etc.). Background: When already executed machine function blocks are released, memory becomes available in the reload buffer. If machine function blocks are no longer released, nothing can be reloaded - this results in a deadlock situation.</p> <p>Examples:</p> <ul style="list-style-type: none"> <li>- Definition of extremely long curve tables via execution from external.</li> <li>- REPEAT command: REPEAT loop does not lie completely within the reload buffer.</li> </ul> |
| <b>Reaction:</b>              | <p>Interpreter stop</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remedy:</b>                | <p>Insert machine function blocks into the part program.</p> <ul style="list-style-type: none"> <li>- Increase the size of the reload buffer (MD18360 \$MN_MM_EXT_PROG_BUFFER_SIZE).</li> <li>- Decrease the size of the curve table (Note: Blocks within CTABDEF/CTABEND are not machine function blocks).</li> <li>- REPEAT command: Replace REPEAT loop by EXTCALL call.</li> <li>- Surface Turning: If alarm 15150 occurs with the function "Surface Turning" when using program sections, reduce the number of blocks commented out in programs generated with SFT.</li> </ul>                                                                         |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. **15171 [Channel %1: ] Block %2 compiled program %3 older than the relevant subroutine**

|                               |                                                                                                                                                                                                                                    |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Compiled program file name                                                                                                                                                 |
| <b>Explanation:</b>           | When calling a precompiled subroutine, it was noticed that the compiled program is older than the relevant SPF file. The compiled program was deleted and during start the subroutine is executed instead of the compiled program. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                   |
| <b>Remedy:</b>                | Perform another precompilation.                                                                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                   |

|                               |                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>15172</b>                  | <b>[Channel %1: ] Block %2 subroutine %3. No interface available at time of preprocessing.</b>                                                                                                                                                                                                                                                                                         |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Subroutine name                                                                                                                                                                                                                                                                                                                |
| <b>Explanation:</b>           | In compilation mode no program interface of the subroutine to be called was available at the time of pre-compilation.                                                                                                                                                                                                                                                                  |
| <b>Reaction:</b>              | Interpreter stop<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Modify part program or recreate program interfaces and pre-compile programs again.                                                                                                                                                                                                                                                                                                     |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                   |
| <b>15173</b>                  | <b>[Channel %1: ] Block %2 variable %3 was unknown at the time of preprocessing.</b>                                                                                                                                                                                                                                                                                                   |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Variable                                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | At the time of program precompilation, variable %3 was not known to the control.                                                                                                                                                                                                                                                                                                       |
| <b>Reaction:</b>              | Interpreter stop<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Correct the part program or introduce the variable at the time of precompilation, i.e. activate the new GUD variable prior to precompilation. Then restart precompilation.                                                                                                                                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                   |
| <b>15175</b>                  | <b>[Channel %1: ] Block %2 program %3. Interfaces could not be built</b>                                                                                                                                                                                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = String                                                                                                                                                                                                                                                                                                                         |
| <b>Explanation:</b>           | An error has occurred in interface generation mode. The (compiler) error message refers to the program specified here. In particular when loading new cycle program on the NCK, problems can occur if the value settings in MD18170 \$MN_MM_NUM_MAX_FUNC_NAMES and MD18180 \$MN_MM_NUM_MAX_FUNC_PARAM are too small.                                                                   |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | - Modify part program.<br>- If new cycle programs have been loaded on the NCK, you will normally need to increase the values of MD18170 \$MN_MM_NUM_MAX_FUNC_NAMES and MD18180 \$MN_MM_NUM_MAX_FUNC_PARAM. See also the explanations for alarm 6010.                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                           |
| <b>15176</b>                  | <b>[Channel %1: ] Block %2 Program%3 may only be executed after Power ON</b>                                                                                                                                                                                                                                                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = File name                                                                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | If an encrypted program is loaded to the NCK, an NCK reset (restart) must be performed afterwards, because internal data for efficient processing of the encrypted program are preprocessed during NCK power-up. On calling an encrypted NC program it has now been detected that these data do not exist or are obsolete compared to the current version of the encrypted NC program. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                  |

**Remedy:** Perform an NCK reset (restart).  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**15177** **[Channel %1: ] Block %2 Error on preprocessing of program %3, error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = File name  
%4 = Error code

**Explanation:** If an encrypted program is loaded to the NCK, an NCK reset (restart) must be performed afterwards, because internal data for efficient processing of the encrypted program are preprocessed during NCK power-up. The following problem has occurred:  
Error code 1: Error on read-in of program %4  
Error code 2: There is not enough DRAM memory available for storing the preprocessed data.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Error code 1: Encrypt and load program %4 again. Then perform an NCK reset (restart).  
Error code 2: Where possible, increase \$MN\_MM\_T\_FILE\_MEM\_SIZE.  
Otherwise increase \$MN\_MM\_DRAM\_FILE\_MEM\_SIZE.  
Then perform an NCK reset (restart).

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**15180** **[Channel %1: ] Block %2: Error on editing program %3 as INI/DEF file.**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = String

**Explanation:** Errors were found when processing an initialization program (INI file), or a GUD or macro definition file (DEF file).  
The error message which is then displayed refers to the program specified here.

**Reaction:** Alarm display.

**Remedy:** Correct the initialization program (INI file), or the GUD or macro definition file (DEF file).  
In connection with Alarm 12380 or 12460, also change the memory configuration.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**15182** **[channel %1: ] cycle alarm from the modified SIEMENS cycle %3**

**Parameters:** %1 = Channel number  
%2 = Is not used  
%3 = Path and file name of the modified SIEMENS cycle

**Explanation:** When executing a SIEMENS cycle modified by the user, a cycle alarm was output with SETAL() (see follow-up alarm in the alarm output).  
Since the SIEMENS cycle was modified by the user (e.g. machine manufacturer), the cause for the cycle alarm must be determined / eliminated by the user who modified the cycle.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** The error cause leading to the cycle alarm cannot be investigated by SIEMENS since the know-how of the modified cycle sequence is with those who are responsible for the cycle change.

**Programm continuation:** Clear alarm with the Delete key or NC START.

|                               |                                                                                                                                                                                                                                                                                                                  |

| <b>15187</b>                  | <b>[Channel %1: ] Error during execution of PROGEVENT file %3.</b>                                                                                                                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Is not used<br>%3 = PROGEVENT file name                                                                                                                                                                                                                                              |
| <b>Explanation:</b>           | An error has occurred on executing PROGEVENT.<br>With alarm 15187, the name of the program that was started as PROGEVENT is displayed. Alarm 15187 is displayed together with the alarm that describes the error cause. Alarm 15187 is also output when the alarm occurs in a subroutine started from PROGEVENT. |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                     |
| <b>Remedy:</b>                | Correct the PROGEVENT file (subroutine).                                                                                                                                                                                                                                                                         |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                     |
| <b>15188</b>                  | <b>[Channel %1: ] Error during execution of ASUB file %3.</b>                                                                                                                                                                                                                                                    |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Is not used<br>%3 = ASUB file name                                                                                                                                                                                                                                                   |

**Explanation:** An error has occurred on executing an ASUB.  
Alarm 15188 displays the name of the program that was started as ASUB. Alarm 15188 is output together with the alarm that describes the error cause. Alarm 15188 is also output when the alarm occurs in a subroutine started from the ASUB.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** Correct the ASUB file (subroutine).

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**15190 [Channel %1: ] Block %2 not enough free memory for subroutine call**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The following deadlock has been found in the interpreter: Memory is needed for calling a subroutine. The module memory is, however, empty and there is no prospect of module memory becoming free again by executing the preprocessing/main run queue, because this queue is empty.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Please inform the authorized personnel/service department. Increase machine data MD28010 \$MC\_MM\_NUM\_REORG\_LUD\_MODULES / MD28040 \$MC\_MM\_LUD\_VALUES\_MEM / MD18210 \$MN\_MM\_USER\_MEM\_DYNAMIC or program a preprocessing stop STOPRE before calling the subroutine.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**15300 [Channel %1: ] Block %2 invalid number-of-passed-blocks during block search**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** In the function "Block search with calculation" a negative number of passes has been entered in column P (number of passes). The permissible range of values is P 1 - P 9 999.

**Reaction:** Alarm display.

**Remedy:** Enter only positive number of passes within the range of values.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**15320 [Channel %1: ] Block %2 invalid block search command**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The block search command (type of search target) is smaller than 1 or greater than 5. It is entered in column type of the block search window. The following block search orders are allowed.

Type Meaning

- 1 Search for block number
- 2 Search for label
- 3 Search for string
- 4 Search for program name
- 5 Search for line number in a file

**Reaction:** Alarm display.

**Remedy:** Modify the block search command.

**Programm continuation:** Clear alarm with the Delete key or NC START.

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis                                                                                                                                                                                                                                                    |
| <b>Explanation:</b>           | The first axis programming after block search to block end point is performed incrementally. This is not allowed in the following situations:<br>- A transformation change took place after the search target.<br>- A frame with rotation component is active. The programmed axis is involved in the rotation. |

**15395 [Channel %1: ] Master-slave not executable during block search**

|                               |                                                                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number                                                                                                                                                                                                                                     |
| <b>Explanation:</b>           | A master-slave coupling is to be closed in the part program via the instruction MASLON. The position offset \$P_SEARCH_MASLD, however, cannot be correctly calculated during block search, as the axes to be coupled are located in different channels. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                   |
| <b>Remedy:</b>                | Make sure that all relevant axes are in the same channel.                                                                                                                                                                                               |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                    |

---

**15400 [Channel %1: ] Block %2 selected initial INIT block does not exist**

|                               |                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                               |
| <b>Explanation:</b>           | The operator has selected an INI block for a read, write or execution function which:<br>1. Does not exist in the NCK range or<br>2. Does not have the necessary protection level required for performing the function.                                                                                                                                       |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department.<br>Check whether the selected INI block is contained in the file system of the NCK. The present protection level must be selected to be at least equal to (or greater than) the protection level that has been defined for the read, write or execution function at the time of creating the file. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                          |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>15410</b>                  | <b>[Channel %1: ] Block %2 initialization file contains invalid M function</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Explanation:</b>           | The only M function allowed in an Init block is the M02, M17 or M30 end-of-program function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Remove all M functions from the Init block except for the end identifier.<br>An Init block may contain value assignments only (and global data definitions if they are not defined again in a program that can be executed later) but no motion or synchronous actions.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Explanation:</b>           | In the compile mode, a compiled program could not be stored. One of the following reasons applies:<br>- Not enough memory<br>- Intermediate code line (compile) too large                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | Create space in work memory or modify part program (make it less complex).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>15460</b>                  | <b>[Channel %1: ] Block %2 syntax error when locking</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Explanation:</b>           | The addresses programmed in the block are not compatible with the modal syntax-determining G function.<br>Example:<br>N100 G01 ... I .. J.. K.. LF                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                               |                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                         |
| <b>Remedy:</b>                | Correct the displayed block and ensure that the G functions and addresses in the block are in agreement. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                         |

---

**15500 [Channel %1: ] Block %2 illegal angle of shear**

|                               |                                                                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                    |
| <b>Explanation:</b>           | The function CSHEAR has been called with an illegal (impossible) angle of shear, e.g. when the sum of angles between the axis vectors is greater than 360 degrees. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                              |
| <b>Remedy:</b>                | Program the angle of shear in accordance with the geometrical conditions of the machine and workpiece system.                                                      |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                               |

---

**15700 [Channel %1: ] Block %2 illegal cycle alarm number %3**

|                               |                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Cycle alarm number                                |
| <b>Explanation:</b>           | A SETAL command has been programmed with a cycle alarm number smaller than 60 000 or greater than 69 999. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.     |
| <b>Remedy:</b>                | Program alarm number in the SETAL instruction in the correct range.                                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                      |

---

**15701 [Channel %1: ] Block %2 motion synchronous action: %3 illegal cycle alarm number %4**

|                               |                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, line number<br>%3 = Synact ID<br>%4 = Cycle alarm number        |
| <b>Explanation:</b>           | A SETAL command has been programmed with a cycle alarm number smaller than 60 000 or greater than 69 999. |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.    |
| <b>Remedy:</b>                | Program alarm number in the SETAL instruction in the correct range.                                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                      |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                           |
| <b>Explanation:</b>           | Measure with deletion of distance-to-go<br>In the part program, an illegal probe has been programmed with the command MEAS (measure with deletion of distance-to-go). The probe numbers<br>0 ... no probe<br>1 ... probe 1<br>2 ... probe 2<br>are allowed, whether the probe is actually connected or not.<br>Example:<br>N10 MEAS=2 G01 X100 Y200 Z300 F1000<br>Probe 2 with deletion of distance-to-go |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                          |
| <b>Remedy:</b>                | Include a probe number within the limits given above in the keyword MEAS=... This must correspond to the hardware connection of the probe.                                                                                                                                                                                                                                                                |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                          |

---

**15950 [Channel %1: ] Block %2 no traverse motion programmed**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Measure with deletion of distance-to-go  
In the part program, no axis or a traversing path of zero has been programmed with the command MEAS (measure with deletion of distance-to-go).

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the part program and add the axis address or the traversing path to the measurements block.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**15960 [Channel %1: ] Block %2 no traverse motion programmed**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Measure without deletion of distance-to-go  
In the part program, no axis or a traversing path of zero has been programmed with the command MEAW (measure without deletion of distance-to-go).

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the part program and add the axis address or the traversing path to the measurements block.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16000 [Channel %1: ] Block %2 invalid value for lifting direction**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** During the "rapid lift from contour" (keyword: LIFTFAST), a code value for the lifting direction (keyword: ALF=...) which lies outside the permissible range (permissible value range: 0 to 8) was programmed.  
With active cutter radius compensation:  
Code numbers 2, 3 and 4 cannot be used in G41  
Code numbers 6, 7 and 8 cannot be used in G42 because they code the direction to the contour.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Program the lifting direction under ALF=... within the permissible limits.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16005 [Channel %1: ] Block %2 invalid value for lifting distance**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Mistake in programming: the value for the lifting path must not be negative.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify the part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

|                               |                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16010</b>                  | <b>[Channel %1: ] Block %2 machining stop after lift fast</b>                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                    |
| <b>Explanation:</b>           | LIFTFAST without interrupt routine (ASUB) has been programmed. The channel is stopped after the lift motion has been carried out.                  |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                              |
| <b>Remedy:</b>                | After the channel stop, you must retract the axes manually in JOG and cancel the program with Reset.                                               |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                               |
| <b>16015</b>                  | <b>[Channel %1: ] Block %2 wrong axis identifier %3</b>                                                                                            |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name                                                                                  |
| <b>Explanation:</b>           | Axis names from different coordinate systems were used to program axes for LIFTFAST. The retraction movement is no longer clear.                   |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                   |
| <b>Remedy:</b>                | Use axis identifiers of a coordinate system.                                                                                                       |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                   |
| <b>16016</b>                  | <b>[Channel %1: ] Block %2 no retraction position programmed for axis %3</b>                                                                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name                                                                                  |
| <b>Explanation:</b>           | The retraction enable was programmed for LIFTFAST without defining a retraction position for the axis. The retraction movement is no longer clear. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                   |
| <b>Remedy:</b>                | Program a retraction position for the relevant axis.                                                                                               |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                   |
| <b>16017</b>                  | <b>[Channel %1: ] Axis %2 Identifier %3, LIFTFAST ignores this axis, current axis not capable of retraction</b>                                    |
| <b>Parameters:</b>            | %1 = Channel<br>%2 = Axis, spindle<br>%3 = Identifier                                                                                              |

**Explanation:** LIFTFAST cannot be applied to the axis.

Alarm can be suppressed via MD11415 \$MN\_SUPPRESS\_ALARM\_MASK\_2 bit 11.

Identifier (parameter 3) is bit-coded and displays some possible causes for the alarm:

0x01 Axis is in another channel  
 0x02 Axis is in spindle mode (e.g. SPOS)  
 0x04 Axis is PLC axis  
 0x08 Axis is oscillating axis  
 0x10 Axis is neutral axis  
 0x20 Axis is coupled slave axis  
 0x40 Axis is in static synchronized action

Overview of reactions of common programming to LIFTFAST:

Axis | Synact | Reaction to LIFTFAST

```
-----
Path |   | STOP + LIFTFAST
POS  |   | STOP + LIFTFAST
POS  | non-modal | STOP + LIFTFAST
POS  | modal | STOP + LIFTFAST
POS  | stati. | RUN + SHOWALARM 16017
POSA |   | STOP + LIFTFAST
MOV  | non-modal | STOP + LIFTFAST
MOV  | modal | STOP + LIFTFAST
MOV  | stati. | RUN + SHOWALARM 16017
PLC  |   | RUN + SHOWALARM 16017
Oscill. |   | RUN + SHOWALARM 16017
SPOS |   | STOP + SHOWALARM 16017
SPOS | non-modal | STOP + SHOWALARM 16017
SPOS | modal | STOP + SHOWALARM 16017
SPOS | stati. | RUN + SHOWALARM 16017
SPOSA |   | STOP + SHOWALARM 16017
```

**Reaction:** Alarm display.

**Remedy:** Remove axis from POLFMLIN or POLFMASK.

Alarm can be suppressed via MD11415 \$MN\_SUPPRESS\_ALARM\_MASK\_2 bit 11.

At the time of LIFTFAST, an axis for LIFTFAST is programmed, but the status of the axis does not allow LIFTFAST (e.g. oscillating axis or spindle), or the axis is not in the channel. LIFTFAST should only be applied to those axes that are capable of retracting at that time; POLFMASK or POLFMLIN should be adapted accordingly.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

## 16020 [Channel %1: ] Repositioning in block %2 is not possible

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** Programming or operator action incorrect:

Repositioning via REPOS command is only possible in an asynchronous subprogram (interrupt routine).

If the REPOS command was programmed, e.g. in the main program or in a cycle, part program execution is cancelled with alarm 16020.

In addition, the alarm is output in the following situations:

- Access to \$AC\_RETPOINT (repositioning point) outside an ASUB (e.g. in the main program)
- An axis to be repositioned was an oscillating axis with synchronous infeed (OSCILL) in the interrupted block and is now in a state that does not allow it to be traversed as a oscillating axis. Remedy: Change the axis to "neutral axis" state before repositioning with WAITP.
- An axis to be repositioned was an infeed axis for an oscillating axis in the interrupted block; now it can no longer be traversed as one. Remedy: Change the axis back to "POS axis" state before repositioning.
- Thread cutting (G33, G34, G35, G335, G336) was active in the interrupted block.

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Modify the part program if necessary.                                                                 |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

|                               |                                                                                                                                                                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16025</b>                  | <b>[Channel %1: ] Block %2 impermissible axis exchange in REPOS command by axis %3.</b>                                                                                                                                                             |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis identifier                                                                                                                                                                             |
| <b>Explanation:</b>           | With the REPOS command, an axis or spindle was programmed that was in the NEUTRAL state at that time. As the REPOS command cannot execute any implicit GET, these axes/spindles cannot be repositioned. Part program editing is therefore canceled. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                               |
| <b>Remedy:</b>                | Assign the axes/spindles that are to be repositioned to the channel via GET command prior to the REPOS command.<br>Example:<br>GET(A) ; assign the A axis to the channel<br>REPOS L A ; reposition the geometry axes and A axis                     |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Explanation:</b>           | The spline and polynomial interpolation are options that are not contained in the basic version of the control.                                                                                                                                                                                                                                                                                                          |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Do not program spline and polynomial interpolation, or retrofit the necessary option.                                                                                                                                                                                                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                         |

|                               |                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16300</b>                  | <b>[Channel %1: ] Block %2 denominator polynomial with zero places within parameter range not allowed</b>                                                                                                                                                                                                                                              |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                        |
| <b>Explanation:</b>           | The programmed denominator polynomial (with PL [ ] = ... , i.e. without specification of geometry axis) has a zero place within the defined parameter range (PL = ...). This means that the quotient of the numerator polynomial and the denominator polynomial is infinite or indeterminate.                                                          |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Modify the polynomial block so that there is no zero place within the polynomial length in the denominator polynomial.                                                                                                                                                                                                                                 |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                       |
| <hr/>                         |                                                                                                                                                                                                                                                                                                                                                        |
| <b>16400</b>                  | <b>[Channel %1: ] Block %2 positioning axis %3 cannot participate in spline</b>                                                                                                                                                                                                                                                                        |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | An axis assigned to a spline grouping (n) with SPLINEPATH (n, AX1, AX2, ...) has been programmed as positioning axis with POS or POSA.                                                                                                                                                                                                                 |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Do not assign the positioning axis to the spline grouping.                                                                                                                                                                                                                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                       |
| <hr/>                         |                                                                                                                                                                                                                                                                                                                                                        |
| <b>16410</b>                  | <b>[Channel %1: ] Block %2 axis %3 is not a geometry axis</b>                                                                                                                                                                                                                                                                                          |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | A geometry axis has been programmed that cannot be imaged on any machine axis in the current transformation (possibly there is no transformation active at the moment).<br>Example:<br>Without transformation: Polar coordinate system with X, Z, and C axis<br>With transformation: Cartesian coordinate system with X, Y, and Z, e.g. with TRANSMIT. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Activate transformation type with TRAORI (n) or do not program geometry axes that do not participate in the transformation grouping.                                                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                       |
| <hr/>                         |                                                                                                                                                                                                                                                                                                                                                        |
| <b>16420</b>                  | <b>[Channel %1: ] Block %2 axis %3 programmed repeatedly</b>                                                                                                                                                                                                                                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | It is not allowed to program an axis more than once.                                                                                                                                                                                                                                                                                                   |

|                               |                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Delete the axis addresses that have been programmed more than once.              |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                 |

---

|                               |                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16430</b>                  | <b>[Channel %1: ] Block %2 geometry axis %3 cannot traverse as positioning axis in rotated coordinate system</b>                                                                                                                                                                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                                                                                                                                                                          |
| <b>Explanation:</b>           | In the rotated coordinate system, traversing of a geometry axis as positioning axis (i.e. along its axis vector in the rotated coordinate system) would mean traversing of several machine axes. This is in conflict with the positioning axis concept, however, in which one axis interpolator runs in addition to the path interpolator! |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Traverse geometry axes as positioning axes only with rotation deactivated.<br>Deactivate rotation:<br>Keyword ROT without further specification of axis and angle.<br>Example: N100 ROT                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                           |

**16600 [Channel %1: ] Block %2 spindle %3 gear stage change not possible**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Spindle number                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Explanation:</b>           | The programmed speed is outside the speed range of the set gear stage. In order to execute the programmed speed, the gear stage must be changed. In order to be able to execute the automatic gear stage change (M40 is active), the spindle must be in speed control operation.<br>The alarm will no longer be output after having set bit 30 (0x40000000) in MD11410 \$MN_SUPPRESS_ALARM_MASK. However, the function will not be affected by this. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Remedy:</b>                | The changeover to speed control operation is performed by programming M3, M4 or M5. The M functions can be written together with the S word in the same block.                                                                                                                                                                                                                                                                                       |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                     |

---

**16605 [Channel %1: ] Block %2 Spindle %3 Gear stage change in %4 not possible**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Spindle number<br>%4 = Gear stage                                                                                                                                                                                                                                                                                                                             |
| <b>Explanation:</b>           | A gear stage change for the spindle will not be possible, if: <ul style="list-style-type: none"><li>- thread cutting (G33, G34, G35) is active</li><li>- the spindle is active as master or slave spindle in a coupling</li><li>- the spindle is being positioned</li></ul>                                                                                                                                           |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | The gear stage is to be set prior to the corresponding machining step.<br>If it is necessary, however, to change the gear stage within one of the above mentioned functions, this function must be switched off for the time of the gear stage change. Thread cutting is deselected with G1; synchronous spindle coupling is switched off with COUPOF; the spindle positioning operation is exited with M3, M4 or M5. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                      |

|                               |                                                                                                                                                                                                                         |

**16681 [Channel %1: ] Block %2 following axis/spindle %3 CPFPOS not permitted (reason %4)**

|                               |                                                                                                                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number<br>%4 = Reason                                                                                                                                                                                                              |
| <b>Explanation:</b>           | CPFPOS must not be declared for a following axis/spindle of a generic coupling in the current status. The reasons for this may be: <ul style="list-style-type: none"><li>- Reason 1: The coupling does not completely switch off, at least one leading axis/spindle remains active in the coupling.</li></ul> |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | The following remedies are available for the reasons stated below: <ul style="list-style-type: none"><li>- Reason 1: Only declare CPFPOS when switching off the coupling, if it is completely closed.</li></ul>                                                                                               |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                              |

|                               |                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>16682</b>                  | <b>[Channel %1: ] Block %2 following axis/spindle %3 instructions %4 are not possible.</b>                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number<br>%4 = CP instruction             |
| <b>Explanation:</b>           | The stated instructions are not permitted together in one block for a following axis/spindle of a generic coupling.  |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                     |
| <b>Remedy:</b>                | Modify part program.                                                                                                 |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                     |
| <b>16684</b>                  | <b>[Channel %1: ] Block %2 following axis/spindle %3 instructions %4 are not possible separately.</b>                |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number<br>%4 = CP instructions            |
| <b>Explanation:</b>           | The stated instructions are only permitted together in one block for a following axis/spindle of a generic coupling. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                     |
| <b>Remedy:</b>                | Modify part program.                                                                                                 |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                     |
| <b>16685</b>                  | <b>[Channel %1: ] Block %2 following axis/spindle %3 instructions %4 are not possible separately.</b>                |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number<br>%4 = CP instructions            |
| <b>Explanation:</b>           | The stated instructions are only permitted together in one block for a following axis/spindle of a generic coupling. |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.               |
| <b>Remedy:</b>                | Modify part program.                                                                                                 |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                 |
| <b>16686</b>                  | <b>[Channel %1: ] Block %2 following axis/spindle %3 type of coupling/instruction %4 is not possible.</b>            |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number<br>%4 = CP instructions            |
| <b>Explanation:</b>           | The stated instruction is not permitted for the stated type of generic coupling.                                     |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                     |

**Remedy:** Modify part program.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16687**      **[Channel %1: ] Block %2 motion synchronous action %3 type of coupling/instruction %4 is not possible.**

**Parameters:**      %1 = Channel number  
                         %2 = Block number, line number  
                         %3 = Synact ID  
                         %4 = Coupling type

**Explanation:**      The stated instruction is not permitted for the stated type of generic coupling.

**Reaction:**          NC Start disable in this channel.  
                         Interface signals are set.  
                         Alarm display.  
                         NC Stop on alarm.

**Remedy:**            Modify part program.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16690**      **[Channel %1: ] Block %2 following axis/spindle %3 changing the reference system %4 is not possible.**

**Parameters:**      %1 = Channel number  
                         %2 = Block number, label  
                         %3 = Axis name, spindle number  
                         %4 = Reference system

**Explanation:**      An attempt was made to change the reference system with generic coupling active.

**Reaction:**          Correction block is reorganized.  
                         Interface signals are set.  
                         Alarm display.

**Remedy:**            Modify part programm.  
                         End coupling and reactivate with desired reference system.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16692**      **[Channel %1: ] Block %2 following axis/spindle %3 maximum number of couplings in the block %4 has been exceeded**

**Parameters:**      %1 = Channel number  
                         %2 = Block number, label  
                         %3 = Axis name, spindle number  
                         %4 = Maximum number of couplings

**Explanation:**      The maximum number of generic couplings in the block has been exceeded.

**Reaction:**          Correction block is reorganized.  
                         Interface signals are set.  
                         Alarm display.

**Remedy:**            Modify part program.  
                         Reduce the number of generic couplings programmed in the block.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16694 [Channel %1: ] Block %2 following axis/spindle %3 status/instruction %4 is not possible.**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Axis name, spindle number  
 %4 = Status, instruction

**Explanation:** The stated instruction is not permitted for the current status of the generic coupling.

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16695 [Channel %1: ] Block %2 following axis/spindle %3 status/instruction %4 is not possible.**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Axis name, spindle number  
 %4 = Status, instruction

**Explanation:** The stated instruction is not permitted for the current status of the generic coupling.

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16696 [Channel %1: ] Block %2 following axis/spindle %3 coupling has not been defined.**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Axis name, spindle number

**Explanation:** An instruction to an undefined coupling is to be executed.

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Modify part programm.  
 Define the coupling and activate, if necessary, before the instruction.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16697 [Channel %1: ] Block %2 following axis/spindle %3 coupling has not been defined.**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Axis name, spindle number

**Explanation:** An instruction to an undefined coupling is to be executed.

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.

**Remedy:** Modify part programm.  
Define the coupling and activate, if necessary, before the instruction.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16698 [Channel %1: ] Block %2 following axis/spindle %3 leading axis/spindle %4 has not been defined.**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis name, spindle number  
%4 = Axis name, spindle number

**Explanation:** An instruction to an undefined leading axis/spindle of a coupling is to be executed.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify part programm.  
Define the leading axis/spindle and activate, if necessary, before the instruction.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16699 [Channel %1: ] Block %2 motion synchronous action %3 leading axis/spindle %4 has not been defined.**

**Parameters:** %1 = Channel number  
%2 = Block number, line number  
%3 = Synact ID  
%4 = Axis name

**Explanation:** An instruction to an undefined leading axis/spindle of a coupling is to be executed.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Modify part programm.  
Define the leading axis/spindle and activate, if necessary, before the instruction.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16700 [Channel %1: ] Block %2 axis %3 invalid feed type**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis name, spindle number

**Explanation:** In a thread cutting function, the feed has been programmed in a unit that is impermissible.  
G33 (thread with constant lead) and the feed have not been programmed with G94 or G95.  
G33 (thread with constant lead) is active (modal) and G63 is programmed additionally in a following block. (Conflict situation! G63 is in the 2nd G group, G33, G331 and G332 are in the 1st G group).  
G331 or G332 (rigid tapping) and the feed have not been programmed with G94.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Use only the feed type G94 or G95 in the thread cutting functions.  
After G33 and before G63, deselect the thread cutting function with G01.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16701 [Channel %1: ] Block %2 motion synchronous action %3 following axis/spindle %4 coupling is not defined**

**Parameters:** %1 = Channel number  
 %2 = Block number, line number  
 %3 = Synact ID  
 %4 = Axis name, spindle number

**Explanation:** An instruction to an undefined coupling is to be executed.

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.

**Remedy:** Modify part programm.  
 Define the coupling and activate, if necessary, before the instruction.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16715 [Channel %1: ] Block %2 axis %3 spindle not in standstill**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Spindle number

**Explanation:** The spindle must be stationary for the applied function (G74, reference point approach, interpolated turning).

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Program M5 or SPOS/SPOSA in front of the defective block in the part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16720 [Channel %1: ] Block %2 axis %3 thread pitch is zero**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Axis name, spindle number

**Explanation:** No pitch was programmed in a thread block with G33 (thread with constant pitch) or G331 (rigid tapping).

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** The thread pitch must be programmed for the specified geometry axis under the associated interpolation parameters.  
 X -> I  
 Y -> J  
 Z -> K

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16730 [Channel %1: ] Block %2 axis %3 wrong parameter**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Axis name, spindle number

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>In G33 (tapping with constant pitch) the pitch parameter was not assigned to the axis that determines the velocity. For longitudinal and face threads, the thread pitch for the specified geometry axis must be programmed under the associated interpolation parameter.</p> <p>X -&gt; I<br/>Y -&gt; J<br/>Z -&gt; K</p> <p>For taper threads, the address I, J, K depends on the axis with the longer path (thread length). A 2nd lead for the other axis is, however, not specified.</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | <p>Assign lead parameters to the axis that determines the velocity.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |

---

**16735 [Channel %1: ] Block %2 Incorrect geometry parameter (error %3)**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | <p>%1 = Channel number<br/>%2 = Block number, label<br/>%3 = Error specification</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Explanation:</b>           | <p>For G335/G336 (thread cutting with a convex thread) the pitch parameter could not be assigned to a velocity-defining axis. The error number specifies the precise cause:</p> <p>Error 1 : The pitch parameter does not match the end points or the program circular plane.<br/>Error 2 : A circular path angle of greater than 90 degrees was programmed.<br/>Error 3 : The circular path has a helical component (helix).<br/>Error 4 : The circular path exceeds one of the angles 45/135/225/315 degrees in the programming.<br/>Error 5 : The circular path exceeds one of the angles 45/135/225/315 degrees after calculating in the frame.<br/>Error 6 : The pitch was not programmed for the axis with the longest traversing path.</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Remedy:</b>                | <p>- check circle programming or<br/>- assign pitch parameter to the axis with the longest traversing distance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

---

**16736 [Channel %1: ] In block %2: Prog. thread block too short to comply with the dynamic limit values %3, %4 is required**

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | <p>%1 = Channel number<br/>%2 = Block number, label<br/>%3 = Smoothing length that can be taken from the programmed thread block<br/>%4 = Smoothing length required for dynamic response adjustment with compliance with the limit values</p>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Explanation:</b> | <p>If programming requires a dynamic response adjustment from one thread element to the next, a check is made to see if the path length is long enough to comply with the dynamic limit values. Only a part of the programmed path length can be used for this smoothing because the programmed target speed of the thread block for the required thread geometry (thread pitch, spindle speed) has to be reached and output. It must be assumed that the dynamic limit values will be exceeded for the dynamic response adjustment to the required thread geometry.</p> <p>The alarm is only output if it is not suppressed by bit 25 of MD11415 \$MN_SUPPRESS_ALARM_MASK_2.</p> |
| <b>Reaction:</b>    | <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

- Remedy:**
1. Change part program and lengthen the path of thread block %2.  
There is a danger of collision as a result of path lengthening, especially for female threads. This must be checked.
  2. Lengthen smoothing length of the thread block with DITRB = -1.
  3. Set MD11415 \$MN\_SUPPRESS\_ALARM\_MASK\_2 bit 25.
  4. Set setting data SD42010 \$SC\_THREAD\_RAMP\_DISP[2] = 0.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 16740 [Channel %1: ] Block %2 no geometry axis programmed

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** No geometry axis was programmed for tapping (G33) or for rigid tapping (G331, G332). The geometry axis is, however, essential if an interpolation parameter has been specified.

Example:

N100 G33 Z400 K2 ; thread pitch 2mm, thread end Z=400 mm

N200 SPOS=0 ; position spindle in axis mode

N201 G90 G331 Z-50 K-2 ; tapping to Z=-50, counterclockwise

N202 G332 Z5 ; retraction, direction reversal automatic

N203 S500 M03 ; spindle again in spindle mode

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Specify geometry axis and corresponding interpolation parameters.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 16746 [Channel %1: ] Block %2 spindle %3 selected gear stage %4 not installed

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Spindle number  
%4 = Gear stage

**Explanation:** The first gear stage data block is active. The required gear stage is not installed in the 1st gear stage data block. The number of gear stages installed is configured in MD35090 \$MA\_NUM\_GEAR\_STEPS.

Examples of the occurrence of the alarm with 3 gear stages installed (MD 35090 \$MA\_NUM\_GEAR\_STEPS = 3):

\* ... M44 or M45 has been programmed for the spindle concerned

\* ...M70 has been programmed and MD35014 \$MA\_GEAR\_STEP\_USED\_IN\_AXISMODE is larger than 3.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify part program: Only those valid gear stages can be entered which have also been installed according to MD35090 \$MA\_NUM\_GEAR\_STEPS.

Limit M70 configuration (MD 35014 \$MA\_GEAR\_STEP\_USED\_IN\_AXISMODE) to MD35090 \$MA\_NUM\_GEAR\_STEPS.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 16747 [Channel %1: ] Block %2 spindle %3 inserted gear stage %4 for tapping not installed

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Spindle number  
%4 = Gear stage

|                               |                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The second gear stage data block has been activated for tapping with G331.<br>However, the current gear stage has not been installed in the second gear stage data block. The number of gear stages installed is configured in MD35092 \$MA_NUM_GEAR_STEPS2. The gear stage cannot be changed in traversing blocks. The gear stage appropriate for the speed must be loaded before the traversing block. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Procedure for automatically engaging the suitable gear stage prior to thread cutting:<br>* Program the spindle speed (S) in a G331 block without axis motions and prior to thread cutting, e.g. G331 S1000.<br>* Activate M40 for the spindle.                                                                                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                         |

---

**16748 [Channel %1: ] Block %2 spindle %3 gear stage %4 expected**

|                               |                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Spindle number<br>%4 = Gear stage                                                                                                                                                                                                                                                                 |
| <b>Explanation:</b>           | G331 activates the second gear stage data block for tapping.<br>The programmed speed (S) of the master spindle lies outside the speed range of the active gear stage in the current traversing block.<br>The gear stage cannot be changed in the traversing block. The gear stage appropriate for the speed must be loaded prior to the traversing block. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                          |
| <b>Remedy:</b>                | Procedure for automatically engaging the suitable gear stage prior to thread cutting:<br>* Program the spindle speed (S) in a G331 block without axis motions and prior to thread cutting, e.g. G331 S1000.<br>* Activate M40 for the spindle.                                                                                                            |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                          |

**16750 [Channel %1: ] Block %2 axis %3 SPCON not programmed**

|                               |                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                          |
| <b>Explanation:</b>           | For the programmed function (rotary axis, positioning axis), the spindle must be in position control mode. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                           |
| <b>Remedy:</b>                | Program position control of the spindle with SPCON in the previous block.                                  |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                           |

---

**16751 [Channel %1: ] Block %2 spindle/axis %3 SPCOF not executable**

|                     |                                                                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                             |
| <b>Explanation:</b> | For the programmed function, the spindle must be in the open-loop control mode. In the positioning or axis mode, the position control must not be deselected. |

|                               |                                                                                                                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                     |
| <b>Remedy:</b>                | Put the spindle into open-loop control mode in the preceding block. This can be done with M3, M4 or M5 for the relevant spindle.                                                                                                                                     |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                     |
| <hr/>                         |                                                                                                                                                                                                                                                                      |
| <b>16757</b>                  | <b>[Channel %1: ] Block %2 for following spindle %3 coupling as leading spindle/axis already existing</b>                                                                                                                                                            |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Following spindle number                                                                                                                                                                                     |
| <b>Explanation:</b>           | A coupling has been switched on in which the following spindle/axis has already been active as leading spindle/axis in another coupling. Chained couplings cannot be processed.                                                                                      |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                     |
| <b>Remedy:</b>                | Check in the part program whether the following spindle/axis is already active as leading spindle/axis in another coupling.                                                                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                     |
| <hr/>                         |                                                                                                                                                                                                                                                                      |

| <hr/>                         |                                                                                                                                                                                                                                                                      |
| <b>16760</b>                  | <b>[Channel %1: ] Block %2 axis %3 S value missing</b>                                                                                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                                                                                                    |
| <b>Explanation:</b>           | No spindle speed has been given for rigid tapping (G331 or G332).                                                                                                                                                                                                    |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                     |
| <b>Remedy:</b>                | Program the spindle speed under address S in [rpm] (in spite of axis mode); the direction of rotation is given by the sign of the spindle lead:<br>- Positive thread pitch: Rotational direction as M03.<br>- Negative thread pitch: Rotational direction as M04 N2. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                     |

|                               |                                                                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16761</b>                  | <b>[Channel %1: ] Block %2 axis/spindle %3 not programmable in the channel</b>                                                                                                        |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                     |
| <b>Explanation:</b>           | Mistake in programming: The axis/spindle cannot be programmed in the channel at this time. This alarm can occur when the axis/spindle is being used by another channel or by the PLC. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                      |
| <b>Remedy:</b>                | Modify the part program. Use "GET()".                                                                                                                                                 |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                      |
| <b>16762</b>                  | <b>[Channel %1: ] Block %2 spindle %3 thread function is active</b>                                                                                                                   |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Spindle number                                                                                                                |
| <b>Explanation:</b>           | Incorrect programming: the spindle function can currently not be executed. This alarm occurs when the spindle (master spindle) is linked with the axes by an interpolation function.  |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                      |
| <b>Remedy:</b>                | Modify the part program. Deselect thread cutting or tapping.                                                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                      |
| <b>16763</b>                  | <b>[Channel %1: ] Block %2 axis %3 programmed speed is illegal (zero or negative)</b>                                                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                     |
| <b>Explanation:</b>           | A spindle speed (S value) was programmed with the value zero or with a negative value.                                                                                                |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                      |
| <b>Remedy:</b>                | Program the speed (S value) with a positive value. Depending on the application case, the value zero may be permissible, e.g. G25 S0.                                                 |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                      |
| <b>16765</b>                  | <b>[Channel %1: ] Block %2 motion synchronous action: %3 following spindle/axis missing</b>                                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, line number<br>%3 = Synact ID                                                                                                               |
| <b>Explanation:</b>           | The following spindle/axis has not been written in the part program.                                                                                                                  |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                |
| <b>Remedy:</b>                | Modify part program.                                                                                                                                                                  |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                      |

---

**16766 [Channel %1: ] Block %2 motion synchronous action: %3 string cannot be interpreted**

**Parameters:** %1 = Channel number  
 %2 = Block number, line number  
 %3 = Synact ID

**Explanation:** A coupling has been switched on in which a non-interpretable string has been written (e.g. block change behavior).

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16767 [Channel %1: ] Block %2 motion synchronous action: %3 leading spindle/axis missing**

**Parameters:** %1 = Channel number  
 %2 = Block number, line number  
 %3 = Synact ID

**Explanation:** The master spindle/axis has not been programmed in the part program.

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16769 [Channel %1: ] Block %2 motion synchronous action: %3 too many couplings for axis %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, line number  
 %3 = Synact ID  
 %4 = Axis name, spindle number

**Explanation:** For the specified axis/spindle, more master axes/spindles have been defined than are allowed.

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**16770 [Channel %1: ] Block %2 axis %3 no measuring system available**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Axis name, spindle number

|                               |                                                                                                                                                                                                                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | One of the following spindle functions has been programmed, the position control requires:<br>SPCON,<br>SPOS, SPOSA,<br>COUPON,<br>G331/G332.<br>The position control requires at least one measuring system.<br>No measuring system has been configured in MD30200 \$MA_NUM_ENCS of the programmed spindle. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                        |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Retrofit a measuring system.                                                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                         |

---

**16771 [Channel %1: ] Block %3 following axis %2 overlaid movement not enabled**

|                               |                                                                                                                                                                                                                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number<br>%3 = Block number, label                                                                                                                                                                                        |
| <b>Explanation:</b>           | No gear synchronization and no overlay movement can be executed for the stated axis because this is not enabled at the VDI interface. This alarm can be suppressed with MD11415 \$MN_SUPPRESS_ALARM_MASK_2 bit17 = 1 or for CP programming with CPMALARM[FAx] bit11 = 1. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Set the NC/PLC interface signal DB380x DBX5002.4 (enable following axis overlay).                                                                                                                                                                                        |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                                                   |

---

**16772 [Channel %1: ] Block %2 axis %3 is the slave axis, the coupling is being opened**

|                               |                                                                                                                                                                                                                                              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis, spindle                                                                                                                                                                        |
| <b>Explanation:</b>           | The axis is active as a following axis in a coupling. In REF operating mode, the coupling is opened. The alarm can be suppressed with MD11410 \$MN_SUPPRESS_ALARM_MASK bit 29 = 1 or with CP programming by setting CPMALARM[FAx] bit 0 = 1. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                               |
| <b>Remedy:</b>                | The coupling will be closed again after having exited the REF operation mode.                                                                                                                                                                |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                       |

---

**16773 [Channel %1: ] Axis %2 is the following axis. The axis/spindle disables of leading axes %3 and %4 differ from one another.**

|                               |                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis, spindle<br>%3 = Axis, spindle<br>%4 = Axis, spindle                                                                                                                                                                                  |
| <b>Explanation:</b>           | The axis is active in a coupling as a following axis. The leading axes have different states regarding axis/spindle disable. The alarm can be suppressed with MD11415 \$MN_SUPPRESS_ALARM_MASK_2, bit 0 = 1 or with CP programming by setting CPMALARM[FAx] bit 1 = 1. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Set the same axis/spindle disable for all master axes.                                                                                                                                                                                                                 |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                                                 |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16774</b>                  | <b>[Channel %1: ] Synchronization canceled for slave axis/spindle %2</b>                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number                                                                                                                                                                                                                                                                                                                                              |
| <b>Explanation:</b>           | For the indicated axis, the synchronization procedure (EGONSYN or EGONSYNE) was canceled.<br>There are several reasons for canceling the synchronization process: <ul style="list-style-type: none"> <li>- RESET</li> <li>- End of program</li> <li>- Axis goes to follow-up mode</li> <li>- Rapid stop caused by an alarm</li> </ul>                                                              |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Channel not ready.                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | If canceling the synchronization procedure can be tolerated or is intended, the alarm can be suppressed with MD11410 \$MN_SUPPRESS_ALARM_MASK bit 31 = 1 or with CP programming by setting CPMALARM[FAX] bit 2 = 1.<br>Only applicable for electronic gear (EG):<br>If it is not possible to cancel the synchronization procedure, specify the block change criterion FINE in EGONSYN or EGONSYNE. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                               |

| <b>16778</b>                  | <b>[Channel %1: ] Block %2 coupling: Ring coupling at following axis %3 and leading axis %4 impermissible</b>                                                                                                                                                                                                                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number<br>%4 = Axis name, spindle number                                                                                                                                                                                                                                                                                |
| <b>Explanation:</b>           | A coupling has been switched on which results in a cyclic coupling, allowance being made for further couplings. This cyclic coupling cannot be uniquely computed.                                                                                                                                                                                                                                  |

|                               |                                                                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                      |
| <b>Remedy:</b>                | Inform the authorized personnel/service department.<br>Configure the coupling in accordance with MD21300 \$MC_COUPLE_AXIS_1 or correct the NC part program. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                        |

---

**16779 [Channel %1: ] Block %2 coupling: too many couplings for axis %3, see active leading axis %4**

|                               |                                                                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number<br>%4 = Axis name, spindle number                                                                                                           |
| <b>Explanation:</b>           | More leading axes and spindles were defined for the specified axis/spindle than are allowed. The last parameter to be specified is a leading value object/leading axis to which the specified axis/spindle is already linked. |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                        |
| <b>Remedy:</b>                | Correct the part program.                                                                                                                                                                                                     |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                          |

---

**16780 [Channel %1: ] Block %2 following spindle/axis missing**

|                               |                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                  |
| <b>Explanation:</b>           | The following spindle/axis has not been written in the part program.             |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Modify part program.                                                             |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                 |

---

**16781 [Channel %1: ] Block %2 master spindle/axis missing**

|                               |                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                  |
| <b>Explanation:</b>           | The master spindle/axis has not been programmed in the part program.             |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Modify part program.                                                             |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                 |

---

**16782 [Channel %1: ] Block %2 following spindle/axis %3 not available**

|                    |                                                                                   |
|--------------------|-----------------------------------------------------------------------------------|
| <b>Parameters:</b> | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number |
|--------------------|-----------------------------------------------------------------------------------|

|                               |                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | A coupling has been switched on in which the slave spindle/axis is currently not available. Possible causes:<br>- The spindle/axis is active in the other channel.<br>- The spindle/axis has been accessed by the PLC and has not yet been released. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                     |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Put the master spindle/axis with spindle/axis exchange into the necessary channel or release from the PLC.                                                                                |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                     |

---

**16783 [Channel %1: ] Block %2 master spindle/axis %3 not available**

|                               |                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                                                                                                                        |
| <b>Explanation:</b>           | A coupling has been switched on in which the master spindle/axis is currently not available. Possible causes:<br>- Setpoint linkage has been selected and spindle/axis is active in the other channel.<br>- The spindle/axis has been accessed by the PLC and has not yet been released. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Put the master spindle/axis with spindle/axis exchange into the necessary channel or release from the PLC.                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                         |

---

**16785 [Channel %1: ] Block %2 identical spindles/axes %3**

|                               |                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                     |
| <b>Explanation:</b>           | A coupling has been switched on in which the following spindle/axis is identical to the master spindle/axis.                                          |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                      |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department.<br>- Configure link accordingly in MD21300 \$MC_COUPLE_AXIS_1<br>- or modify part program. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                      |

---

**16787 [Channel %1: ] Block %2 coupling parameter not changeable**

|                     |                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                        |
| <b>Explanation:</b> | The specified coupling is write-protected. Therefore, the coupling parameters cannot be modified.                                                                      |
| <b>Reaction:</b>    | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                  |
| <b>Remedy:</b>      | Please inform the authorized personnel/service department.<br>- Remove write protection (see channel MD21340 \$MC_COUPLE_IS_WRITE_PROT_1)<br>- or modify part program. |

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**16788 [Channel %1: ] Block %2 cyclic coupling**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** A coupling has been switched on which results in a cyclic coupling, allowance being made for further couplings. This cyclic coupling cannot be uniquely computed.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Please inform the authorized personnel/service department.  
- Configure link accordingly in MD21300 \$MC\_COUPLE\_AXIS\_1  
- or modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16790 [Channel %1: ] Block %2 Parameter is zero or missing**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** A coupling has been switched on in which a relevant parameter has been specified with zero or has not been written (e.g. denominator in the transmission ratio, no slave axis).

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Please inform the authorized personnel/service department.  
- Configure link accordingly in SD42300 \$SC\_COUPLE\_RATIO\_1  
- or correct part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16791 [Channel %1: ] Block %2 parameter is not relevant**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** A coupling has been switched on in which a non-relevant parameter has been written (e.g. parameter for ELG).

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16792 [Channel %1: ] Block %2 too many couplings for axis/spindle %3**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis name, spindle number

**Explanation:** For the specified axis/spindle, more master axes/spindles have been defined than are allowed.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### **16793 [Channel %1: ] Block %2 coupling of axis %3 prohibits transformation change**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Axis name, spindle number

**Explanation:** The specified axis is a slave axis in a transformation grouping. When the coupling is switched on, the transformation cannot be changed to another one.

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Modify part program. Switch off coupling(s) of this axis before changing transformation or do not change the transformation.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### **16794 [Channel %1: ] Block %2 coupling of axis/spindle %3 prohibits reference point approach**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Axis name, spindle number

**Explanation:** The specified axis is a (gantry) slave axis and cannot therefore approach the reference point.

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Modify part program. Switch off coupling(s) of this axis before reference point approach or do not reference. A gantry slave axis cannot reference for itself.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### **16795 [Channel %1: ] Block %2 string cannot be interpreted**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** A coupling has been switched on in which a non-interpretable string has been written (e.g. block change behavior).

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### **16796 [Channel %1: ] Block %2 coupling not defined**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** A coupling is to be switched the parameters of which have neither been programmed nor configured.

**Reaction:** Correction block is reorganized.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Inform the authorized personnel/service department.  
 Correct the NC part program or MD, program the coupling with COUPDEF or configure by means of MD.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16797 [Channel %1: ] Block %2 coupling is active**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** An operation is to be performed in which no coupling may be active, e.g. COUPDEL or TANGDEL must not be used on active couplings.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct NC part program, deselect the link with COUPOF or TANGOF.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16800 [Channel %1: ] Block %2 traverse instruction DC/CDC for axis %3 not allowed**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis name, spindle number

**Explanation:** The keyword DC (Direct Coordinate) can only be used for rotary axes. This causes approach of the programmed absolute position along the shortest path.

Example:

N100 C=DC(315)

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Please inform the authorized personnel/service department.

Replace the keyword DC in the displayed NC block by specifying AC (Absolute Coordinate).

If the alarm display is the result of an error in the axis definition, the axis can be declared as a rotary axis by means of the axis-specific MD30300 \$MA\_IS\_ROT\_AX.

Corresponding machine data:

Modify MD30310: \$MA\_ROT\_IS\_MODULO

Modify MD30320: \$MA\_DISPLAY\_IS\_MODULO

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**16810 [Channel %1: ] Block %2 traverse instruction ACP for axis %3 not allowed**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis name, spindle number

**Explanation:** The keyword ACP (Absolute Coordinate Positive) is only allowed for "modulo axes". It causes approach of the programmed absolute position in the specified direction.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Please inform the authorized personnel/service department.

In the displayed NC block, replace the keyword ACP by specifying AC (Absolute Coordinate).

If the alarm display is based on an incorrect axis definition, the axis with the axis-specific MD30300 \$MA\_IS\_ROT\_AX and MD30310 \$MA\_ROT\_IS\_MODULO can be declared a rotary axis with modulo change.

Corresponding machine data:

Modify MD30320 \$MA\_DISPLAY\_IS\_MODULO

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 16820 [Channel %1: ] Block %2 traverse instruction ACN for axis %3 not allowed

**Parameters:** %1 = Channel number

%2 = Block number, label

%3 = Axis name, spindle number

**Explanation:** The keyword ACN (Absolute Coordinate Negative) is only allowed for "modulo axes". It causes approach of the programmed absolute position in the specified direction.

**Reaction:** Interpreter stop

NC Start disable in this channel.

Interface signals are set.

Alarm display.

**Remedy:** Please inform the authorized personnel/service department.

In the displayed NC block, replace the keyword ACN by specifying AC (Absolute Coordinate).

If the alarm display is based on an incorrect axis definition, the axis with the axis-specific machine data MD30300: \$MA\_IS\_ROT\_AX and MD30310: \$MA\_ROT\_IS\_MODULO can be declared a rotary axis with modulo change.

Corresponding machine data:

MD30320: \$MA\_DISPLAY\_IS\_MODULO

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

### 16830 [Channel %1: ] Block %2 incorrect position programmed for axis/spindle %3

**Parameters:** %1 = Channel number

%2 = Block number, label

%3 = Axis name, spindle number

**Explanation:** A position beyond the range of 0 - 359.999 has been programmed for a modulo axis.

**Reaction:** Correction block is reorganized.

Interface signals are set.

Alarm display.

**Remedy:** Program position in the range 0 - 359.999.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 16904 [Channel %1: ] Program control: action '%2<ALNX>' not allowed in the current state

**Parameters:** %1 = Channel number

%2 = Action number/action name

**Explanation:** The operation (program, JOG, block search, reference point, etc.) cannot be started or continued in the current status.

**Reaction:** Alarm display.

**Remedy:** Check the program status and the channel status.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 16905 [Channel %1: ] Program control: action '%2<ALNX>' not allowed

**Parameters:** %1 = Channel number

%2 = Action number/action name

**Explanation:** Operation cannot be started or continued. A start is only accepted when an NCK function can be started.

Example: A start is accepted in JOG mode when, for example, the function generator is active or a JOG movement has first been stopped with the Stop key.

**Reaction:** Alarm reaction in Automatic mode.

**Remedy:** Check the program status and the channel status.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16906 [Channel %1: ] Program control: action '%2<ALNX>' is canceled due to an alarm**

**Parameters:** %1 = Channel number  
%2 = Action number/action name

**Explanation:** The action was canceled due to an alarm.

**Reaction:** Alarm display.

**Remedy:** Eliminate the error and acknowledge the alarm. Then restart the operation.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16907 [Channel %1: ] Action '%2<ALNX>' only possible in stop state**

**Parameters:** %1 = Channel number  
%2 = Action number/action name

**Explanation:** This action may only be performed in Stop state.

**Reaction:** Alarm display.

**Remedy:** Check the program status and the channel status.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16908 [Channel %1: ] Action '%2<ALNX>' only possible in reset state or at the block end**

**Parameters:** %1 = Channel number  
%2 = Action number/action name

**Explanation:** This action may only be performed in the Reset state or at the end of block.

In JOG mode, no axis that is traversed as geometry axis in the rotated coordinate system, must be active as PLC or command axis (started through static synchronized action) on mode change. This means that axes like that must be in the state 'neutral axis' again.

**Reaction:** Alarm display.

**Remedy:** Check the program status and channel status.  
Check whether the axes are active as PLC or command axes in JOG mode.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16909 [Channel %1: ] Action '%2<ALNX>' not allowed in current mode**

**Parameters:** %1 = Channel number  
%2 = Action number/action name

**Explanation:** A different operating mode must be activated for the activated function.

**Reaction:** Alarm display.

**Remedy:** Check operation and operating mode.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16911 [Channel %1: ] Mode change is not allowed**

**Parameters:** %1 = Channel number

**Explanation:** The change from overstore into another operating mode is not allowed.

**Reaction:** Alarm display.

**Remedy:** Terminate the "Overstore" function to change to another operating mode.

**Programm continuation:** Clear alarm with the Delete key or NC START.

|                               |                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16912</b>                  | <b>[Channel %1: ] Program control: action '%2&lt;ALNX&gt;' only possible in reset state</b>                                                                                                                                                                                                                                              |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Action number/action name                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b>           | This action can only be performed in Reset state.<br>Example: Program selection through HMI or channel communication (INIT) can only be performed in Reset state.                                                                                                                                                                        |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Reset or wait until processing has finished.                                                                                                                                                                                                                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                             |
| <b>16913</b>                  | <b>[Mode group %1: ] [Channel %2: ] Mode change: action '%3&lt;ALNX&gt;' not allowed</b>                                                                                                                                                                                                                                                 |
| <b>Parameters:</b>            | %1 = Mode group number<br>%2 = Channel number<br>%3 = Action number/action name                                                                                                                                                                                                                                                          |
| <b>Explanation:</b>           | The change to the desired mode is not permitted. The change can only take place in the Reset state.<br>Example:<br>Program processing is halted in AUTO mode by NC Stop. Then there is a mode change to JOG mode (program status interrupted). From this operating mode, it is only possible to change to AUTO mode and not to MDI mode! |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Either actuate the Reset key to reset the program execution, or select the mode in which the program was previously being executed.                                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                             |
| <b>16914</b>                  | <b>[Mode group %1: ] [Channel %2: ] Mode change: action '%3&lt;ALNX&gt;' not allowed</b>                                                                                                                                                                                                                                                 |
| <b>Parameters:</b>            | %1 = Mode group number<br>%2 = Channel number<br>%3 = Action number/action name                                                                                                                                                                                                                                                          |
| <b>Explanation:</b>           | Incorrect mode change, e.g.: Auto -> MDIREF.                                                                                                                                                                                                                                                                                             |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Check the operation and/or the selected mode.                                                                                                                                                                                                                                                                                            |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                             |
| <b>16915</b>                  | <b>[Channel %1: ] Action '%2&lt;ALNX&gt;' not allowed in the current block</b>                                                                                                                                                                                                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Action number/action name                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b>           | If traversing blocks are interrupted by asynchronous subroutines, then it must be possible for the interrupted program to continue (reorganization of block processing) after termination of the asynchronous subroutine.<br>The 2nd parameter describes which action wanted to interrupt block processing.                              |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Let the program continue to a reorganized NC block or modify the part program.                                                                                                                                                                                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                             |
| <b>16916</b>                  | <b>[Channel %1: ] Repositioning: action '%2&lt;ALNX&gt;' not allowed in the current state</b>                                                                                                                                                                                                                                            |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Action number/action name                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b>           | Repositioning of block processing is presently not possible. A mode change cannot take place.<br>The 2nd parameter describes which action should be used to perform repositioning.                                                                                                                                                       |

**Reaction:** Alarm display.  
**Remedy:** Let the program continue to a repositioned NC block or modify the part program.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16918** **[Channel %1: ] For action '%2<ALNX>' all channels must be in reset state**  
**Parameters:** %1 = Channel number  
%2 = Action number/action name  
**Explanation:** All channels must be in the initial setting in order to carry out the action! (For example, for machine data loading)  
**Reaction:** Alarm display.  
**Remedy:** Either wait until the channel status is canceled or press the Reset key.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16919** **[Channel %1: ] Action '%2<ALNX>' is not allowed due to a pending alarm**  
**Parameters:** %1 = Channel number  
%2 = Action number/action name  
**Explanation:** This action cannot be performed due to an alarm, or the channel is in the fault condition.  
**Reaction:** Alarm display.  
**Remedy:** Press the Reset key.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16920** **[Channel %1: ] Action '%2<ALNX>' is already active**  
**Parameters:** %1 = Channel number  
%2 = Action number/action name  
**Explanation:** An identical action is still being processed.  
**Reaction:** Alarm display.  
**Remedy:** Wait until the previous procedure has been completed and then repeat the operation.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16921** **[Mode group %2: ] [Channel %1: ] Machine data: channel/mode group assignment not allowed or assigned twice**  
**Parameters:** %1 = Channel number  
%2 = Mode group number  
**Explanation:** On powering up, an illegal channel/mode group assignment was detected.  
**Reaction:** Mode group not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.  
**Remedy:** Inform the authorized personnel/service department.  
Check MD10010 \$MN\_ASSIGN\_CHAN\_TO\_MODE\_GROUP.  
**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16922</b>                  | <b>[Channel %1: ] Subprograms: action '%2&lt;ALNX&gt;' maximum nesting depth exceeded</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Action number/action name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Explanation:</b>           | Various actions can cause the current procedure to be interrupted. Depending on the action, asynchronous subroutines are activated. These asynchronous subroutines can be interrupted in the same manner as user programs. Unlimited nesting depth is not possible for asynchronous subroutines due to memory limitations.<br><br>Example: An interrupt interrupts the current program processing. Other interrupts with higher priorities interrupt processing of the previously activated asynchronous subroutines.<br><br>Possible actions are: DryRunOn/Off, DecodeSingleBlockOn, delete distance-to-go, interrupts ..... |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | Do not trigger the event on this block.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Explanation:</b>           | The language functions WAITMC, SETM, CLEARM and MSG must be programmed in separate NC blocks. To avoid velocity dips, these blocks are attached to the next NC block internally in the NCK (for WAITMC to the previous NC block). For this reason, there must always be an executable block (not a calculation block) between the NC blocks. An executable NC block always includes e.g. travel movements, a help function, STOPRE, dwell time etc.<br>Note: This does not apply to the programming of MSG with the additional parameter "1". In this case a separate block is generated, which interrupts the continuous-path mode. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interpreter stop<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | Program an executable NC block between the previous and current NC blocks.<br>Example:<br>N10 SETM.<br>N15 STOPRE ; insert executable NC block.<br>N20 CLEARM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

---

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16931</b>                  | <b>[Channel %1: ] Subprograms: action '%2&lt;ALNX&gt;' maximum nesting depth exceeded</b>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Action number/action name                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Explanation:</b>           | Various actions can cause the current procedure to be interrupted. Depending on the action, asynchronous subroutines (ASUBs) are activated. These ASUBs can be interrupted in the same manner as the user program. Unlimited nesting depth is not possible for ASUBs due to memory limitations.<br>Example: In the case of an approach block in a repositioning procedure do not interrupt repeatedly, instead wait until processing is completed.<br>Possible actions are: mode change, SlashOn/Off, overstoring. |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Remedy:</b>                | Initiate a block change and repeat the action.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16932</b>        | <b>[Channel %1: ] Conflict when activating user data type %2</b>                                                                                                                                                                                                                                                                                                                         |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Data type                                                                                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b> | The "activate user data" function (PI service _N_SETUDT) modifies a data block (tool offset, settable work offset or base frame) which is also written by the NC blocks in preparation.<br>In the event of a conflict, the value entered by the HMI is reset.<br>Parameter %2 specifies which data block is affected:<br>1: Active tool offset<br>2: Base frame<br>3: Active work offset |
| <b>Reaction:</b>    | Alarm display.                                                                                                                                                                                                                                                                                                                                                                           |

**Remedy:** Check the inputs on the HMI and repeat the procedure if necessary.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16933 [Channel %1: ] Interrupt treatment: action '%2<ALNX>' not allowed in the current state**

**Parameters:** %1 = Channel number  
%2 = Action number/action name

**Explanation:** If a temporary standstill has occurred because of a Reorg event across block boundaries, it is possible that a block without Reorg capability has been loaded. In this situation, it is unfortunately necessary to cancel the Reorg event handling! Reorg events are, e.g. cancelation subprogram, delete distance-to-go and interrupts.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Cancel program with the RESET key.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**16934 [Channel %1: ] Interrupt treatment: action '%2<ALNX>' not possible due to stop**

**Parameters:** %1 = Channel number  
%2 = Action number/action name

**Explanation:** Reorg events are, e.g. cancelation subprogram, delete distance to go and interrupts, axis exchange, termination of follow-up mode. Two Reorg events overlap in this situation. The 2nd Reorg event coincides with the 1st block generated by the previous event. (e.g. an axis exchange is induced twice in rapid succession). Axis exchange leads to Reorg in the channels in which an axis is removed without preparation. This block must be stopped in the above sequence in order to prevent the interpolator buffer from overflowing. This can be achieved by pressing the Stop or StopAll key, configuring an alarm with INTERPRETERSTOP or by decode single block.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** The program must be canceled with Reset.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**16935 [Channel %1: ] Action '%2<ALNX>' not possible due to search run**

**Parameters:** %1 = Channel number  
%2 = Action number/action name

**Explanation:** The action is not allowed as block search is currently running via program test. Block search via program test: "PI Service \_N\_FINDBL with mode parameter 5.  
With this block search type, it is not permissible to activate program test or dry run feedrate.

**Reaction:** Alarm display.

**Remedy:** Activate the action after block search is terminated.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16936 [Channel %1: ] Action '%2<ALNX>' not possible due to active dry run**

**Parameters:** %1 = Channel number  
%2 = Action number/action name

**Explanation:** This action is not allowed as dry run feedrate is currently active.  
Example: It is not permissible to activate block search via program test (PI service \_N\_FINDBL with mode parameter 5) when dry run feedrate is active.

**Reaction:** Alarm display.  
**Remedy:** Cancel program with the RESET key.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16937 [Channel %1: ] Action '%2<ALNX>' not possible due to program test**

**Parameters:** %1 = Channel number  
 %2 = Action number/action name  
**Explanation:** This action is not allowed as program test is currently active.  
 Example: It is not permissible to activate block search via program test (PI service \_N\_FINDBL with mode parameter 5) when program test is active.  
**Reaction:** Alarm display.  
**Remedy:** Deactivate program test.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16938 [Channel %1: ] Action '%2<ALNX>' canceled due to active gear change**

**Parameters:** %1 = Channel number  
 %2 = Action number/action name  
**Explanation:** Reorganization events are, among others, subprogram cancelation, delete distance-to-go and interrupts, axis exchange, exiting the correction state. These events wait for the end of a gear change. However, the maximum waiting period has elapsed.  
**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.  
**Remedy:** Cancel the program with Reset and, if necessary, increase MD10192 \$MN\_GEAR\_CHANGE\_WAIT\_TIME.  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**16939 [Channel %1: ] Action '%2<ALNX>' rejected due to active gear change**

**Parameters:** %1 = Channel number  
 %2 = Action number/action name  
**Explanation:** Reorganization events that are possible in Stop state, e.g mode change, are waiting for the end of the gear change. However, the maximum waiting period has elapsed.  
**Reaction:** Interface signals are set.  
 Alarm display.  
**Remedy:** Repeat the action or increase MD10192 \$MN\_GEAR\_CHANGE\_WAIT\_TIME.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16940 [Channel %1: ] Action '%2<ALNX>' wait for gear change**

**Parameters:** %1 = Channel number  
 %2 = Action number/action name  
**Explanation:** Reorganization events are waiting for the end of a gear change. The alarm is displayed during the waiting period.  
**Reaction:** Alarm display.  
 Warning display.  
**Remedy:** To suppress the alarm, set MD11411 \$MN\_ENABLE\_ALARM\_MASK bit 1 = 0.  
**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**16941 [Channel %1: ] Action '%2<ALNX>' rejected because no program event has been executed yet****Parameters:** %1 = Channel number

%2 = Action number/action name

**Explanation:** The setting of the MD20108 \$MC\_PROG\_EVENT\_MASK forces an asynchronous subprogram to be triggered automatically on RESET or PowerOn. The implicitly triggered asynchronous subprograms are normally called "Event-triggered program call" or "Program event".

In the alarm situation, this asynchronous subprogram could not yet be activated; that is why the action (normally start of part program) must be rejected.

Reasons for the fact that the asynchronous subprogram could not be triggered:

1. The asynchronous subprogram does not exist (/N\_CMA\_DIR/N\_PROG\_EVENT\_SPF)
2. The asynchronous subprogram is allowed to start in the referenced state only (see MD11602 \$MN\_ASUP\_START\_MASK)
3. READY is missing (because of alarm)

**Reaction:** Alarm display.**Remedy:** Load program

Check MD11602 \$MN\_ASUP\_START\_MASK

Acknowledge alarm

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16942 [Channel %1: ] Start program command action '%2<ALNX>' not possible****Parameters:** %1 = Channel number

%2 = Action number/action name

**Explanation:** Currently, the alarm occurs only in combination with the SERUPRO action. SERUPRO stands for search via program test. SERUPRO is currently searching the target and has therefore switched this channel to the program test mode. With the START program command in channel 1, another channel 2 would actually be started, which means that axes would really be started during the search action.

If this alarm is switched off (see help), the user can make use of the above behavior by initially selecting via PLC the program test mode in channel 2, leaving channel 2 executing until its natural end, stopping channel 2 in order to deselect program test again.

**Reaction:** NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm.

**Remedy:** Alarm can be switched off with MD10708 \$MN\_SERUPRO\_MASK bit 1.**Programm continuation:** Clear alarm with the RESET key. Restart part program

| <b>Explanation:</b>           | <p>The action in the 2nd parameter was rejected, since an asynchronous subprogram is currently active.</p> <p>Currently, only the integrated search run is rejected with this alarm. The integrated search run is activated, if search run is triggered in the Stop program state. In other words: Parts of a program have already been executed and a following program part is "skipped" with search run in order to continue the program afterwards.</p> <p>The event is not possible if the program is stopped within an asynchronous subprogram or if an asynchronous subprogram had been selected before the event. An asynchronous subprogram is selected, when the triggering asynchronous subprogram event arrives, but the asynchronous subprogram cannot be started (e.g. the asynchronous start program is not started because of a read-in disable or because the Stop key is active).</p> <p>In this case, it is irrelevant whether a user ASUB or a system ASUB has been triggered. User ASUBs are activated via FC-9 or via the fast inputs.</p> <p>The following events lead to system ASUBS:</p> <ul style="list-style-type: none"> <li>- Mode change</li> <li>- Overstore on</li> <li>- Canceling subprogram level</li> <li>- Switching on of single block, type 2</li> <li>- Setting machine data effective</li> <li>- Setting user data effective</li> <li>- Change skip levels</li> <li>- Dry run on/off</li> <li>- Program test off</li> <li>- Correction block alarms</li> <li>- Editing modi in Teach</li> <li>- External work offset</li> <li>- Axis exchange</li> <li>- Delete distance-to-go</li> <li>- Measuring</li> </ul> |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | Repeat the action after the end of the asynchronous subprogram.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>16944</b>                  | <b>[Channel %1: ] Action '%2&lt;ALNX&gt;' not possible due to active search blocks</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Action number/action name</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | <p>The NCK is currently processing either the action blocks of the search run or the approach motion after the search run. In this situation, the action (2nd parameter of the alarm) must be rejected. Currently, only the integrated search run is rejected with this alarm. The integrated search run is activated, if search run is triggered in the Stop program state. In other words: Parts of a program have already been executed and a following program part is "skipped" with search run in order to continue the program afterwards.</p> |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | Repeat the action after the approach motion of the search run.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16945</b>        | <b>[Channel %1: ] Action '%2&lt;ALNX&gt;' delayed up to the block end</b>                                                                                                                                                                                                                                                                                                                                           |
| <b>Parameters:</b>  | <p>%1 = Channel number</p> <p>%2 = Action number/action name</p>                                                                                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b> | <p>The currently executing action (e.g. dry run on/off, change skip levels, etc.) should be active immediately, but it can become active not earlier than at the end of the block, since a thread is currently being machined. The action is activated with a slight delay.</p> <p>Example: Dry run is started in the middle of the thread, then traversing at high speed does not start before the next block.</p> |
| <b>Reaction:</b>    | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>      | Alarm can be switched off via MD11410 \$MN_SUPPRESS_ALARM_MASK bit17==1.                                                                                                                                                                                                                                                                                                                                            |

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16946 [Channel %1: ] Start via START is not allowed**

**Parameters:** %1 = Channel ID

**Explanation:** This alarm is active with "Group Serupro" only. "Group Serupro" is activated by means of MD10708 \$MN\_SERUPRO\_MASK, Bit 2 and enables the retrace support of entire channel groups during block search.

The MD22622 \$MC\_DISABLE\_PLC\_START specifies which channel is generally started from the PLC and which channel is only allowed to be started from another channel via the START part program command.

This alarm occurs if the channel was started via the START part programm command and MD22622 \$MC\_DISABLE\_PLC\_START==FALSE was set.

**Reaction:** Alarm display.

**Remedy:** Modify MD22622 \$MC\_DISABLE\_PLC\_START of switch off "Group Serupro" (see MD10708 \$MN\_SERUPRO\_MASK).

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16947 [Channel %1: ] Start via PLC is not allowed**

**Parameters:** %1 = Channel ID

**Explanation:** This alarm is active with "Group Serupro" only. "Group Serupro" is activated by means of MD10708 \$MN\_SERUPRO\_MASK, Bit 2 and enables the retrace support of entire channel groups during block search.

The machine data MD22622 \$MC\_DISABLE\_PLC\_START specifies which channel is generally started from the PLC and which channel is only allowed to be started from another channel via the START part program command.

This alarm occurs if the channel was started via the PLC and MD22622 \$MC\_DISABLE\_PLC\_START==TRUE was set.

**Reaction:** Alarm display.

**Remedy:** Modify MD22622 \$MC\_DISABLE\_PLC\_START of switch off "Group Serupro" (see MD10708 \$MN\_SERUPRO\_MASK).

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16948 [Channel %1: ] dependent channel %2 still active**

**Parameters:** %1 = Channel ID

%2 = Channel ID

**Explanation:** This alarm is active with "Group Serupro" only. "Group Serupro" is activated by means of MD10708 \$MN\_SERUPRO\_MODE, bit 2 and enables the retrace support of entire channel groups during block search.

A \_dependent channel\_ is a channel that had indirectly been started by the currently active channel. The currently active channel was started via PLC.

This channel m\_u\_s\_t be terminated (i.e. reached M30) before the current channel is terminated.

This alarm occurs if the currently active channel is terminated before the dependent channel.

**Reaction:** Alarm display.

**Remedy:** Switch off "Group Serupro" (see MD10708 \$MN\_SERUPRO\_MASK) or install WAITE.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**16949 Correspondence between marker of channel %1 and channel %2 is invalid.**

**Parameters:** %1 = Channel ID

%2 = Channel ID

**Explanation:** This channel defines a WAIT marker with other channels, which on their part have no correspondence with this wait marker. This channel's WAIT marker has no explicit counterpart in the other channel; i.e. the channels do not mutually wait.

=====

Example

Ch 3    Ch 5    Ch 7

WAITM(99,3,5)    WAITM(99,3,5)    WAITM(99,5,7)

The wait markers in channels 3 and 5 mutually wait for each other and channel 7 only waits for channel 5. Therefore, channel 7 may continue when 5 and 7 have reached the wait marker, but channel 3 is still far in front of the wait marker. When it continues, channel 7 deletes its wait marker. When wait marker 99 is reached again, you can no longer determine the behavior precisely.

=====

**Reaction:** Alarm display.

**Remedy:** In each wait marker, list all channels with which you want to synchronize, or suppress the alarm with MD11410 \$MN\_SUPPRESS\_ALARM\_MASK, bit 23.

=====

Sample solution A:

Ch 3    Ch 5    Ch 7

WAITM(99,3,5,7)    WAITM(99,3,5,7)    WAITM(99,3,5,7)

=====

Sample solution B:

Ch 3    Ch 5    Ch 7

WAITM(99,3,5)    WAITM(99,3,5)

          WAITM(88,5,7)    WAITM(88,5,7)

=====

Sample solution C:

Ch 3    Ch 5    Ch 7

          WAITM(88,5,7)    WAITM(88,5,7)

WAITM(99,3,5)    WAITM(99,3,5)

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

## 16950 [Channel %1: ] Search run with hold block

**Parameters:** %1 = Channel number

**Explanation:** Informational alarm.

The search run was not performed on the interruption block, instead, it touches down shortly before that. This so-called "hold block" is generated by the part program command IPTRLOCK, or implicitly defined by MD22680 \$MC\_AUTO\_IPTR\_LOCK. This is to prevent you from performing a search run in critical program areas (e.g. gear hobbing). The alarm also displays that, instead of searching for the block that actually was interrupted before, another block is being searched for. This behavior is desired and the alarm serves only informational purposes.

**Reaction:** Alarm display.

**Remedy:** MD11410 \$MN\_SUPPRESS\_ALARM\_MASK, MD22680 \$MC\_AUTO\_IPTR\_LOCK and language command IPTRLOCK

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

## 16951 [Channel %1: ] Search run in a protected program section.

**Parameters:** %1 = Channel number

**Explanation:** A part programmer can define protected part program sections with the language commands IPTRLOCK and IPTRUNLOCK. Every search run in these program sections will then be acknowledged with alarm 16951. In other words: When the alarm appears, the user has started a search run (Serupro type) and the search target lies in a protected area. A protected area can also be defined implicitly with the MD22680 \$MC\_AUTO\_IPTR\_LOCK.

Note:

The alarm can only be generated if the simulation has been completed during the search run. The alarm cannot be output immediately at the start of the search run.

|                                   |                                                                                                        |
|-----------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>                  | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm. |
| <b>Remedy:</b>                    | MD11410 \$MN_SUPPRESS_ALARM_MASK, MD22680 \$MC_AUTO_IPTR_LOCK and language command IPTRLOCK            |
| <b>Programm<br/>continuation:</b> | Clear alarm with the RESET key. Restart part program                                                   |

---

|                                   |                                                                                                                                                                                                                                                                                                                                                                    |

| <b>16952</b>                      | <b>[Channel %1: ] Start program command not possible due to MDI</b>                                                                                                                                                                                                                                                                                                |
| <b>Parameters:</b>                | %1 = Channel number                                                                                                                                                                                                                                                                                                                                                |
| <b>Explanation:</b>               | NCK is currently executing an ASUB in MDI mode. In this constellation, part program command "Start" is not allowed for another channel. Attention: If an ASUB is started from JOG, the NCK can internally change to MDI, if the NCK was previously in MDI and not in RESET. Note: Without this alarm, the MDI buffer of the other channel would always be started. |
| <b>Reaction:</b>                  | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                    | Start ASUB in AUTO or ->JOG in AUTO                                                                                                                                                                                                                                                                                                                                |
| <b>Programm<br/>continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                               |

---

|                                   |                                                                                                                                                                                                                                                                     |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16953</b>                      | <b>[Channel %1: ] For slave axis %2 SERUPRO not allowed, as master axis %3 not subject to axis/spindle disable</b>                                                                                                                                                  |
| <b>Parameters:</b>                | %1 = Channel number<br>%2 = Slave axis name, following spindle number<br>%3 = Master axis name, master spindle number                                                                                                                                               |
| <b>Explanation:</b>               | Currently, the alarm occurs only in combination with the SERUPRO action. SERUPRO stands for search via program test. SERUPRO is possible only with an active coupling, if the axis/spindle disable is active for all master axes/spindles of the slave axis/spindle |
| <b>Reaction:</b>                  | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                              |
| <b>Remedy:</b>                    | Set axis/spindle disable of the master axis                                                                                                                                                                                                                         |
| <b>Programm<br/>continuation:</b> | Clear alarm with the RESET key. | <b>Explanation:</b>           | In a program area (stop delay area) that is bracketed by DELAYFSTON and DELAYFSTOF, an event has been detected that causes a stop. The stop is delayed and executed after DELAYFSTOF. A stop delay area can also be defined by MD11550 \$MN_STOP_MODE_MASK.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Explanation:</b>           | The program area (Stop-Delay area), which is bracketed by DELAYFSTON and DELAYFSTOF, could not be activated. Every stop therefore becomes effective immediately and is not delayed!<br>This occurs every time, when braking into a stop Stop-Delay area, i.e. a braking process starts before the Stop-Delay area and ends not earlier than in the Stop-Delay area.<br>If the Stop-Delay area is entered with override 0, the Stop-Delay area can also not be activated<br>Example: a G4 before the Stop-Delay area allows the user to reduce the override to 0. The next block in the Stop-Delay area then starts with override 0 and the alarm situation described occurs.<br>MD11411 \$MN_ENABLE_ALARM_MASK, bit 7 switches on this alarm. |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>16963</b>                  | <b>[Channel %1: ] ASUB start declined</b>                                                                                                                                                                                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | An external ASUB start from the canceled program state has been declined for the following reasons:<br>- Bit 0 is not set in MD11602 \$MN_ASUP_START_MASK<br>- ASUB priority has been set too low (value too high) or MD11604 \$MN_ASUP_START_PRIO_LEVEL has been set too high (value too low) |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | Correct the machine data or change the priority of the ASUB to be executed.                                                                                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                   |
| <hr/>                         |                                                                                                                                                                                                                                                                                                |
| <b>16964</b>                  | <b>[Channel %1: ] Executing of init blocks not fully completed</b>                                                                                                                                                                                                                             |
| <b>Parameters:</b>            | %1 = Channel number                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | Init blocks are processed during ramp-up; they ensure that the control is initialized correctly. The alarm is set if processing could not be completed correctly (usually due to alarms which were already pending).                                                                           |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | Eliminate pending alarms.                                                                                                                                                                                                                                                                      |

| <b>Explanation:</b>           | <p>A syntax rule was violated when defining an auxiliary function or a subprogram name. The error code helps pinpoint the problem:</p> <ol style="list-style-type: none"> <li>1 - An auxiliary function definition must start with M, D, H or T.</li> <li>2 - An auxiliary function definition needs an extension or a value.</li> <li>3- If present, an auxiliary function extension must be a wild card '*' or a natural number enclosed in square brackets '[, ]'. A natural number is only allowed for 'T' auxiliary functions when \$MC_T_M_ADDRESS_EXT_IS_SPINO = TRUE or with active magazine management (MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK, MD20310 \$MC_TOOL_MANAGEMENT_MASK).</li> <li>4 - If present, the value of an auxiliary function must be a natural number or a wild card '*' after an equals sign '='.</li> <li>5 - With active tool management (MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK, MD20310 \$MC_TOOL_MANAGEMENT_MASK), a numerical value must not be given for 'T', only a wild card '*' is allowed.</li> <li>6 - Other entries as auxiliary functions are interpreted as subprogram names. A subprogram name must be a valid NC subprogram name with the prefix '_N_', without path specification and without '/'. It must not contain special or control characters. It must not be a keyword of the NC language (e.g. POSA).</li> <li>7 - '_N_ASUP1' and '_N_ASUP2' are not permitted as subprogram definitions because these are the subprogram names from system ASUBs.</li> </ol> <p>- Examples of correct auxiliary function definitions are: 'H[3]=7', 'M[22]', 'D[*]=4', 'T[*]=*', 'T=*', .</p> <p>An example of a correct subprogram name is '_N_TOOL_TWIST'.</p> |

| <b>Explanation:</b>           | When executing/reading files from the active working memory, it was found that there is not enough memory space (e.g. for large multidimensional arrays such as LUD or GUD arrays or when creating tool offset memory).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                               |                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                      |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Make arrays smaller or make more memory space available for memory management of subroutine calls, tool offsets and user variables (machine data MM_...).<br>See /FBI/, S7 Memory Configuration |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                       |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Explanation:</b>           | General:<br>Read or write access has been programmed to an array variable with an invalid 1st array index. The valid array indices must lie within the defined array size and the absolute limits (0 - 32 766).<br>PROFIBUS/PROFINET I/O:<br>An illegal slot / I/O area index was used while reading/writing data.<br>Cause:<br>1.: Slot / I/O area index >= max. number of available slot / I/O areas.<br>2.: Slot / I/O area index references a slot / I/O area that has not been configured.<br>3.: Slot / I/O area index references a slot / I/O area that has not been released for system variables.<br>The following applies specifically: If the alarm occurs while writing one of the parameters \$TC_MDP1/\$TC_MDP2/\$TC_MLSR, check whether MD18077 \$MN_MM_NUM_DIST_REL_PER_MAGLOC has been set correctly.<br>MD18077 \$MN_MM_NUM_DIST_REL_PER_MAGLOC defines the number of different Index1 statements that may be made for an Index2 value.<br>If an MT number is programmed, the value may collide with a previously defined T number or a previously defined magazine number. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | Correct the specification of array elements in the access instruction to match the defined size.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

---

**17030 [Channel %1: ] Block %2 illegal array index 2**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** General:  
A read or write access has been programmed to an array variable with an invalid 2nd array index. The valid array indices must lie within the defined array size and the absolute limits (0 - 32 766).  
PROFIBUS/PROFINET I/O:  
An attempt was made to read/write data outside the slot / I/O area limits of the stated slot / I/O area.  
The following applies specifically: If the alarm occurs while writing one of the parameters \$TC\_MDP1/\$TC\_MDP2/\$TC\_MLSR, check whether MD18076 \$MN\_MM\_NUM\_LOCS\_WITH\_DISTANCE has been set correctly.  
\$MN\_MM\_NUM\_LOCS\_WITH\_DISTANCE defines the number of different buffer storage locations that may be named in Index2

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the specification of array elements in the access instruction to match the defined size.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17035 [Channel %1: ] Block %2 illegal array index 3**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** General:  
A read or write access has been programmed to an array variable with an invalid 3rd array index. The valid array indices must lie within the defined array size and the absolute limits (0 - 32766).

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the specification of array elements in the access instruction to match the defined size.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17040 [Channel %1: ] Block %2 illegal axis index**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** A read or write access has been programmed to an axial variable in which the axis name cannot be unambiguously imaged on a machine axis.

Example:

Writing of an axial machine data

\$MA\_... [X]= ... ; but geometry axis X cannot be imaged on a machine axis because of a transformation!

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Deselect transformation before writing into the axial data (keyword: TRAFOOF) or use the machine axis names as axis index.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17050 [Channel %1: ] Block %2 illegal value**

**Parameters:** %1 = Channel number  
%2 = Block number, label

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>A value has been programmed that exceeds the value range or a limit value of a variable or a machine data item.</p> <p>For example: In a string variable (e.g. GUD or LUD), a string needs to be written that exceeds the agreed string length in the variable definition.</p> <ul style="list-style-type: none"> <li>- If an illegal value is to be written to a tool or magazine management variable (e.g. illegal cutting edge number in \$TC_DPCE[x,y] or illegal magazine location number in \$TC_MDP2[x,y])</li> <li>- The value of MTL is incorrect. MTL must be programmed with a multitool location number of a multitool that is programmed in the command T=magazine location number in the same NC block.</li> <li>- An illegal value is to be written in \$P_USEKT or \$A_DPB_OUT[x,y]</li> <li>- An illegal value is to be written in a machine data (e.g. MD10010 \$MN_ASSIGN_CHAN_TO_MODE_GROUP[0] = 0)</li> <li>- On accessing an individual frame element, a frame component other than TRANS, ROT, SCALE or MIRROR was addressed or the CSCALE function was assigned a negative scale factor.</li> </ul> <p>A multitool number has been programmed that collides with a previously defined T number or a previously defined magazine number.</p> <p>When programming DELMLOWNER: The command cannot be programmed with the T number of a tool that is part of a multitool.</p> |
| <b>Reaction:</b>              | <p>Interpreter stop</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | Address frame components only with the keywords provided; program the scale factor between the limits of 0.000 01 to 999.999 99.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Parameters:</b>  | <p>%1 = Channel number</p> <p>%2 = Block number, label</p>                                                               |
| <b>Explanation:</b> | The required GUD variable was not found for a MEACALC procedure during read or write access.                             |
| <b>Reaction:</b>    | <p>Interpreter stop</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> |

**Remedy:** Check whether all the GUDs were created for MEACALC.  
DEF CHAN INT \_MVAR, \_OVI[11]  
DEF CHAN REAL \_OVR[32], \_EV[20], \_MV[20], \_SPEED[4], \_SM\_R[10], \_ISP[3]  
DEF NCK REAL \_TP[3,10], \_WP[3,11], \_KB[3,7], \_CM[8], \_MFS[6]  
DEF NCK BOOL \_CBIT[16]  
DEF NCK INT \_CVAL[4].

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**17060 [Channel %1: ] Block %2 requested data area too large**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The maximum memory space of 8 KB available for a symbol has been exceeded.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Reduce array dimensions.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17070 [Channel %1: ] Block %2 data is write-protected**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** An attempt was made to write into a write-protected variable (e.g. a system variable). Safety Integrated: Safety system variables can only be written into via the safety SPL program.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Please inform the authorized personnel/service department. Modify part program.

Safety Integrated:

- Delete write accesses to safety system variables in part programs other than the safety SPL program
- Verify the release of the safety functionality

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17071 [Channel %1: ] Block %2 data read-protected**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** An attempt has been made to read a read-protected variable (e.g. a system variable).

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Please set the corresponding access right or modify the part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17080 [Channel %1: ] Block %2 %3 value below lower limit**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = MD

**Explanation:** An attempt was made to write into a machine data with a value smaller than the defined lower limit.

|                               |                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                  |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Determine the input limits of the machine data and assign a value within these limits. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                  |

---

**17090 [Channel %1: ] Block %2 %3 value exceeds upper limit**

|                               |                                                                                                                                                   |

| <b>17150</b>                  | <b>[Channel %1: ] Block %2 maximum of %3 NC outputs programmable in the block</b>                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Quantity                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Explanation:</b>           | No more than the specified number of outputs may be programmed in an NC block.<br>The quantity of hardware outputs is defined in the MDs:<br>MD10360 \$MN_FASTIO_DIG_NUM_OUTPUTS and<br>MD10310 \$MN_FASTIO_ANA_NUM_OUTPUTS                                                                                                                                                                                                                                                                                      |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | Program fewer digital/analog outputs in a block. The specified maximum number applies in each case separately for analog or digital outputs. If necessary, program two NC blocks.                                                                                                                                                                                                                                                                                                                                |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>17160</b>                  | <b>[Channel %1: ] Block %2 no tool selected</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | An attempt has been made to access the current tool offset data via the system variables:<br>\$P_AD [n]: Contents of the parameter (n: 1 - 25)<br>\$P_TOOL: Active D number (tool edge number)<br>\$P_TOOLL [n]: Active tool length (n: 1- 3)<br>\$P_TOOLR: Active tool radius<br>although no tool had been selected previously.                                                                                                                                                                                 |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Remedy:</b>                | Program or activate a tool offset in the NC program before using the system variables.<br>Example:<br>N100 G.. ... T5 D1 ... LF<br>With the channel-specific machine data:<br>Modify MD22550 \$MC_TOOL_CHANGE_MODE<br>New tool offset for M function<br>Modify MD22560 \$MC_TOOL_CHANGE_M_CODE<br>M function with tool change<br>It is established whether a tool offset is activated in the block with the T word or whether the new offset values are allowed for only when the M word for tool change occurs. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>17170</b>                  | <b>[Channel %1: ] Block %2 number of symbols too large</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | The predefined symbols could not be read in during power-up.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                            |

**Remedy:** If you experience such a system error, please contact Technical Support.  
[www.siemens.com/sinumerik/help](http://www.siemens.com/sinumerik/help)

Please supply the following information to ensure quick processing:

- Alarm number together with alarm text
- Description of the operation/mode before the alarm message
- Generate log files using the key combination: <Ctrl> + <Alt> + <D>

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**17180 [Channel %1: ] Block %2 illegal D number**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** In the displayed block, access is made to a D number that is not defined and therefore is not available.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Check tool call in the NC part program:

- Correct tool correction number D programmed? If no D number is specified with the tool change command, then the D number set by MD20270 \$MC\_CUTTING\_EDGE\_DEFAULT will be active automatically. It is D1 by default.
- Tool parameters (tool type, length,...) defined? The dimensions of the tool edge must have been entered previously either through the operator panel or through a tool data file in NCK.

Description of the system variables \$TC\_DPx[t, d] as included in a tool data file.

x ... Correction parameter number P  
t ... Associated tool number T  
d ... Tool correction number D

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17181 [Channel %1: ] Block %2 T no.= %3, D no.= %4 not existing**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = T number  
%4 = D number

**Explanation:** A programmed D number was not recognized by the NC. By default, the D number refers to the specified T number. If the flat D number function is active, T= 1 is output.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** You have the following possibilities of eliminating the error:

- The program is incorrect: Eliminate the error with a correction block and continue the program.
- The data block is missing: Load a data block for the specified T/D values onto the NCK via HMI with overstore, and continue the program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17182 [Channel %1: ] Block %2 illegal sum correction number**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** An attempt was made to access a non-defined total offset of the current tool edge.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Check the access to the total offset memory with \$TC\_SCP\*, \$TC\_ECP\*, total offset selection DLx or tool selection Ty or offset selection Dz.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 17183 [Channel %1: ] Block %2 H number already available in T no.= %3, D no.= %4

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = T number  
%4 = D number

**Explanation:** Each H number (except for H=0) must be assigned in a TO unit only once. The indicated edge already has the H number. If the H number shall be assigned more than once, MD10890 \$MN\_EXTERN\_TOOLPROG\_MODE, bit 3 must be set = 1.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** - Change program:  
- Select different H number

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 17184 [Channel %1: ] Block %2 Tool %3, Duplo no. %5, D no.= %6 does not exist

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Tool identifier  
%4 = Duplo number | D number

**Explanation:** A D number has been programmed that does not exist for the selected tool.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** If the selected tool does not contain the programmed D number,  
\* the data block for the cutting edge can be loaded into the NC (via HMI, with overstore) or  
\* the cutting edge can be created subsequently, or,  
\* if necessary, the D number and/or the tool identifier can be corrected in the displayed block,  
and the NC program can be continued..

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 17188 [Channel %1: ] D number %2 defined in tool T no. %3 and %4

**Parameters:** %1 = Channel number  
%2 = Offset number D  
%3 = T number of first tool  
%4 = T number of second tool

**Explanation:** The specified D number %2 in the TO unit of channel %1 is not unique. The specified T numbers %3 and %4 each have an offset with number %2.

If tool management is active:

The specified T numbers belong to tool groups with different names.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** You have the following possibilities of eliminating the error:

1. Use unique D numbering within the TO unit.
2. Use another command.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 17189 [Channel %1: ] D number %2 of tools defined on magazine/location %3 and %4

**Parameters:** %1 = Channel number

%2 = Offset number D

%3 = Magazine/location number of first tool, '/' as separator

%4 = Magazine/location number of second tool, '/' as separator

**Explanation:** The specified D number %2 in the TO unit of channel %1 is not unique. The specified T numbers %3 and %4 each have an offset with number %2.

If tool management is active:

The specified T numbers belong to tool groups with different names.

**Reaction:** Interface signals are set.

Alarm display.

**Remedy:** You have the following possibilities of eliminating the error:

1. Use unique D numbering within the TO unit. Rename the D numbers if necessary.
2. Use another command.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 17190 [Channel %1: ] Block %2 illegal T number %3

**Parameters:** %1 = Channel number

%2 = Block number, label

%3 = T number

**Explanation:** In the displayed block, a tool is accessed that is not defined and is therefore not available. The tool has been named by its T number, its name or its name and duplo number.

If the function T=magazine location is activated and programmed, the programmed T number indicates the magazine location number. The alarm can then indicate that the programmed magazine location number is illegal.

If the function T=magazine location is activated and programmed, and the multitool function is also activated and programmed in the program line MTL, the alarm can also indicate that there is no multitool at the location programmed with T=magazine location

or that there is no tool at the multitool location programmed with MTL.

**Reaction:** Correction block is reorganized.

Interface signals are set.

Alarm display.

**Remedy:** Check tool call in the NC part program:

- Is the correct tool number T.. programmed?

- T=magazine location programming: Is the correct magazine location number programmed?

- MTL programming: Is there a multitool at the programmed magazine location or is there a tool at the programmed multitool location?

- Are tool parameters P1 - P25 defined? The dimensions of the tool edge must have been entered previously either via the operator panel or the V.24 interface.

Description of the system variables \$P\_DP x [n, m]

n ... Associated tool number T

m ... Tool edge number D

x ... Parameter number P

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Remedy:</b>                | If the program pointer is at an NC block which contains the specified T identifier: If the program is incorrect, remedy the error with a correction block and continue the program. If the data block is missing, create one. You can do this by downloading a data block with all the defined D numbers onto the NCK (via HMI with overstore) and continue the program.<br>If the program pointer is at an NC block which does not contain the specified T identifier: The error occurred at an earlier point in the program where the T command appeared, but the alarm was not output until the change command was detected.<br>If the program is incorrect - T5 programmed instead of T55 - the current block can be corrected with a correction block; i.e. if only M06 is entered, you can correct the block with T55 M06. The incorrect T5 line remains in the program until it is terminated by a RESET or end of program.<br>In complex program structures with indirect programming, it may not be possible to correct the program. In this case, you can only intervene locally with an overstore block - with T55 in the example. If the data block is missing, create one. You can do this by downloading the data block of the tool with all the defined D numbers onto the NCK (via HMI with overstore), program the T command with overstore, and continue the program. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Explanation:</b>           | The tool with the specified tool identifier, duplo number cannot accept the group identifier. Reason: The maximum number of replacement tools allowed has already been defined. The name allocation causes the tool to be reallocated to a tool group which already contains the maximum number of replacement tools allowed on this machine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>17212</b>                  | <b>[Channel %1: ] Tool management: Load manual tool %3, duplo no. %2 onto spindle/toolholder %4</b>                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Duplo no.<br>%3 = Tool identifier<br>%4 = Toolholder number (spindle number)                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | Indicates that the specified manual tool must be loaded in the specified toolholder or spindle before the program continues. A manual tool is a tool whose data is known to the NCK but has not been assigned to a magazine location and is, therefore, not fully accessible to the NCK for automatic tool change or, in most cases, to the machine either.<br>The specified manual tool can also be a tool in a multitool. In this case the multitool has to be changed. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Remedy:</b>                | Make sure that the specified tool is loaded in the toolholder. The alarm is cleared automatically after PLC acknowledgment of the tool change on command.                                                                                                                                                                                                                                                                                                                 |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. | <b>Explanation:</b>           | Indicates that the specified manual tool must be loaded in the specified toolholder or spindle before the program is continued and that the manual tool located there must be removed. A manual tool is a tool whose data are known to the NCK but which is not assigned to a magazine location and is thus not fully accessible to the NCK, and usually also to the machine, for an automatic tool change.                                                                           |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | Make sure that the manual tools are exchanged. The alarm is cleared automatically after PLC acknowledgment of the tool change on command. Manual tools can only be used efficiently if this is supported by the PLC program.                                                                                                                                                                                                                                                          |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Explanation:</b>           | This alarm occurs if a T no., the tool name or the tool name and duplo number is used in an attempt to access a tool that has not been defined or is yet to be defined (e.g. if tools are to be positioned in magazine locations by programming \$TC_MPP6 = 'toolNo'). This will only be possible if both the magazine location and the tool specified with 'toolNo' have been defined. The tool which does not exist can also be a multitool (the multitool is treated like a tool). |

| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                             |
| <b>Explanation:</b> | Possible causes of the error:<br>- For an old-type tool adapter (type 1), parameters belonging to the new-type adapter (type 2) cannot be written.<br>- For a new-type tool adapter (type 2), parameters belonging to the old-type adapter (type 1) cannot be written.<br>The adapter type can neither be changed nor set to less than 0 or greater than 2. |
| <b>Reaction:</b>    | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                            |
| <b>Remedy:</b>      | - For an old-type tool adapter (type 1), only write parameters belonging to type 1.<br>- For a new-type tool adapter (type 2), only write parameters belonging to type 2.<br>- The adapter type can only be set once with the value 1 or 2.                                                                                                                 |

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 17250 [Channel %1: ] Block %2 illegal magazine definition

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** If an attempt is made to modify a magazine data that would subsequently damage the data consistency or lead to a conflicting definition, this alarm will appear.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the NC program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 17255 [Channel %1: ] Block %2 magazine location hierarchies have been deleted

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** If \$TC\_MAMP2, bit 15 is changed, existing hierarchies may be deleted because of a change in meaning.

**Reaction:** Alarm display.

**Remedy:** Redefine magazine location hierarchies.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 17260 [Channel %1: ] Block %2 illegal magazine location definition

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** This alarm occurs if an attempt is made to change a magazine location data which would subsequently damage data consistency irreparably or lead to a conflicting definition.

Example: If parameter \$TC\_MPP1 (= type of location) is written with 'spindle/toolholder location', this may conflict with the limiting MD18075 \$MN\_MM\_NUM\_TOOLHOLDERS.

The remedy is then either - if permitted by the control model - to increase the value of MD18075 \$MN\_MM\_NUM\_TOOLHOLDERS

or to correct the magazine definition.

A tool cannot be simultaneously:

- Loaded in two different magazine locations.
- A part of a multitool and in a magazine location.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the NC program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 17261 [TO unit %1: ] Not all the values of %3 from magazine %2 can be displayed.

**Parameters:** %1 = TO unit  
%2 = Magazine number  
%3 = Parameter names

**Explanation:** Not all user magazine location data (\$TC\_MPPCx[magNo, locNo]) can be accessed via OPI.

**Reaction:** Alarm display.

**Remedy:** - Either reduce the number of OEM magazine location parameters. (MD18092 \$MN\_MM\_NUM\_CC\_MAGLOC\_PARAM)  
- Or reduce the number of magazine locations in the stated magazine. (\$TC\_MAP6[magNo], \$TC\_MAP7[magNo])  
The product of the 3 stated parameters must not exceed 32767.

**Programm continuation:** Clear alarm with the Delete key or NC START.  
This is just an information alarm.

---

**17262 [Channel %1: ] Block %2 illegal tool adapter operation (Cause: %3)**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Cause

**Explanation:** Meaning of the error causes:

1: There is already another adapter on the intended magazine or multitool location.

Note: If MD18104 \$MN\_MM\_NUM\_TOOL\_ADAPTER = -1 is set, each magazine location is assigned a type 1 adapter from the start.

2: There is already a tool on the intended magazine or multitool location.

3: The adapter cannot be removed from the location because there is still a tool on the location.

4: An attempt is being made to place a non-existent adapter at a magazine or multitool location.

5: The adapter cannot be deleted because it is still assigned to a location.

6: If \$MN\_MM\_NUM\_TOOL\_ADAPTER = -1, all adapters or one adapter of type 1 cannot be deleted.

6: If \$TC\_ADPTT[n] = -1, a type 2 adapter cannot be deleted.

6: If \$TC\_ADPTT[0] = -1, no adapter can be deleted, if \$MN\_MM\_NUM\_TOOL\_ADAPTER\_TYPE2 > 0.

21: Grinding tools (type 4xx) and turning tools (type 5xx) are not allowed on a location with a new-type adapter (type 2):

22: An old-type tool adapter (type 1) cannot yet be assigned to a multitool location.

23: A new-type tool adapter (type 2) cannot yet be assigned to a magazine location.

24: If a multitool with an adapter is placed at a magazine location with an adapter, only a type 1 adapter may be on the magazine location with the default setting.

(((\$TC\_ADPT1[n]= 0.0, \$TC\_ADPT2[n]= 0.0, \$TC\_ADPT3[n]= 0.0, \$TC\_ADPTT[n]= 1)

25: Initially a type 2 adapter may only be placed on a multitool location with one location

**Reaction:** Correction block is reorganized.

Interface signals are set.

Alarm display.

**Remedy:** - Assign a maximum of one adapter to a magazine location.  
- If MD18104 \$MN\_MM\_NUM\_TOOL\_ADAPTER = -1, only write adapter data already associated with the magazine locations.  
- When assigning an adapter to a magazine location, the magazine location must not contain a tool.  
- When removing an adapter from a magazine location, the magazine location must not contain a tool.  
- Only place existing adapters at a magazine or multitool location.  
- Only type 1 adapters can be deleted with \$TC\_ADPTT[n] = -1.  
- All adapters with \$TC\_ADPTT[0] = -1 can only be deleted if \$MN\_MM\_NUM\_TOOL\_ADAPTER\_TYPE2=0.  
- Set only permitted tool types on a location with new type adapters (type 2).  
- Assign old-type tool adapters (type 1) only to a magazine location.  
- Assign new-type tool adapters (type 2) only to a multitool location.  
- Do not cascade an adapter to a magazine location and a multitool location.  
- Set up a multitool with only one magazine location for a type 2 adapter.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17270 [Channel %1: ] Block %2 call-by-reference: illegal variable**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Machine data and system variables must not be transferred as call-by-reference parameters.

|                               |                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                              |
| <b>Remedy:</b>                | Modify NC program: Assign the value of the machine data or of the system variable to a program-local variable and transfer this as parameter. |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                              |

---

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>17502</b>                  | <b>[Channel %1: ] Block %2 indexing axis %3 with Hirth tooth system stop is delayed</b>                                                                                                                                                                                                                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name                                                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | For the indexing axis, the 'Hirth tooth system' function is activated and the override has been set to 0 or another stop condition (e.g. VDI interface signal) is active. Since it is possible to stop only on indexing axes, the next possible indexing position is approached. The alarm is displayed until this position is reached or the stop condition is deactivated. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Remedy:</b>                | You have the following possibilities of eliminating the error:<br>Wait until the next possible indexing position is reached.<br>Set the override > 0.<br>Deactivate another stop condition.                                                                                                                                                                                  |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                                                                                                                                                       |

| <b>17600</b>                  | <b>[Channel %1: ] Block %2 preset on transformed axis %3 not possible</b>                                                                                                                                                                                                                                                                                                                   |
| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Block number, label</p> <p>%3 = Axis name, spindle number</p>                                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | <p>The programmed preset key axis is involved in the current transformation. This means that setting the actual value memory (PRESET) is not possible for this axis (valid for PRESETON and PRESETONS).</p> <p>Example:</p> <p>Machine axis A should be set to the new actual value A 100 at the absolute position A 300.</p> <p>:</p> <p>N100 G90 G00 A=300</p> <p>N101 PRESETON A=100</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | Avoid preset actual value memory for axes which are participating in a transformation or deselect the transformation with the keyword TRAFOOF.                                                                                                                                                                                                                                              |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                            |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>17601</b>        | <b>[Channel %1: ] Block %2 motion synchronous action: %3 preset not possible on axis %4</b>                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters:</b>  | <p>%1 = Channel number</p> <p>%2 = Block number, line number</p> <p>%3 = Synact ID</p> <p>%4 = Axis name, spindle number</p>                                                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b> | <p>Actual value preset not possible for this axis because</p> <ul style="list-style-type: none"> <li>- the axis is moving</li> <li>- the axis is involved in a transformation</li> <li>- the axis is currently being monitored for collision</li> <li>- the spindle traverse movement has not yet been completed</li> <li>- reference point approach (G74) is active</li> <li>- the geometry axis is not in the 'neutral axis' state</li> </ul> |
| <b>Reaction:</b>    | <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm.</p>                                                                                                                                                                                                                                                                                                                       |

**Remedy:** Avoid actual value preset or put the relevant geometry axis in the 'neutral axis' state in good time with RELEASE(...).  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17602 [Channel %1: ] Block %2 motion synchronized action: %3 preset not possible on axis %4 in JOGREF mode**

**Parameters:** %1 = Channel number  
%2 = Block number, line number  
%3 = Synact ID  
%4 = Axis name, spindle number

**Explanation:** The actual value cannot be preset for this axis if the mode group to which this axis is assigned is in JOG mode and if the machine function reference point approach is also selected.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Avoid setting actual value in this configuration or deselect the machine function reference point approach.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17603 [Channel %1: ] Block %2 motion synchronized action: %3 preset is only possible on a stationary axis %4 in JOG mode**

**Parameters:** %1 = Channel number  
%2 = Block number, line number  
%3 = Synact ID  
%4 = Axis name, spindle number

**Explanation:** In JOG mode, an actual value can only be preset on stationary axes.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Avoid setting an actual value while the axis is in motion; wait until the axis is stationary.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17604 [Channel %1: ] Block %2 motion synchronized action: %3 preset not possible on active oscillating axis (axis %4)**

**Parameters:** %1 = Channel number  
%2 = Block number, line number  
%3 = Synact ID  
%4 = Axis name, spindle number

**Explanation:** An actual value cannot be preset on an active oscillating axis controlled via synchronized actions.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Avoid setting actual value during active oscillating movement.  
**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

|                               |                                                                                                                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>17610</b>                  | <b>[Channel %1: ] Block %2 axis %3 involved in the transformation, action cannot be carried out</b>                                                                                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                         |
| <b>Explanation:</b>           | The axis is involved in the active transformation. It can therefore not execute the demanded action, traversing as positioning axis, enable for axis exchange.                            |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                          |
| <b>Remedy:</b>                | Deselect the transformation with TRAFOOF ahead of time or remove the action from the part program block                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                          |
| <b>17620</b>                  | <b>[Channel %1: ] Block %2 approaching fixed point for transformed axis %3 not possible</b>                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                         |
| <b>Explanation:</b>           | In the displayed block, an axis is programmed for the fixed point approach (G75) that is involved in the active transformation. Fixed point approach is not performed with this axis!     |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                          |
| <b>Remedy:</b>                | Remove G75 instruction from the part program block or previously deselect transformation with TRAFOOF.                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                          |
| <b>17630</b>                  | <b>[Channel %1: ] Block %2 referencing for transformed axis %3 not possible</b>                                                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                         |
| <b>Explanation:</b>           | In the displayed block, an axis is programmed for reference point approach (G74) that is involved in the active transformation. Reference point approach is not performed with this axis! |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                          |
| <b>Remedy:</b>                | Remove G74 instruction, or the machine axes involved in transformation, from the part program block or previously deselect the transformation with TRAFOOF.                               |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                          |
| <b>17640</b>                  | <b>[Channel %1: ] Block %2 spindle operation for transformed axis %3 not possible</b>                                                                                                     |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                         |
| <b>Explanation:</b>           | The axis programmed for the spindle operation is involved in the current transformation as geometry axis. This is not allowed.                                                            |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                          |
| <b>Remedy:</b>                | First disable the transformation function.                                                                                                                                                |

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17650 [Channel %1: ] Block %2 machine axis %3 not programmable**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis name, spindle number

**Explanation:** The machine axis cannot be used in an active transformation. You may be able to program the function in a different coordinate system. For example, it may be possible to specify the retraction position in the basic coordinate system or the workpiece coordinate system. The axis identifier is used to select the coordinate system.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Deactivate the transformation or use another coordinate system.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17800 [Channel %1: ] Block %2 illegally coded position programmed**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The position number n specified with the keyword FP=n is not permissible. Two (2) absolute axis positions can be directly defined as fixed points by the axis-specific machine data MD30600 \$MA\_FIX\_POINT\_POS[n].  
Or, if position numbers 3 and/or 4 are to be used, then machine data MD30610 \$MA\_NUM\_FIX\_POINT\_POS must be set accordingly.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Program keyword FP with machine fixed points 1 or 2.

Example:

Approach fixed point 2 with machine axes X1 and Z2.

N100 G75 FP=2 X1=0 Z2=0

Or modify MD30610 \$MA\_NUM\_FIX\_POINT\_POS and, if necessary, MD30600 \$MA\_FIX\_POINT\_POS[ ].

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**17810 [Channel %1: ] Axis %2 not referenced**

**Parameters:** %1 = Channel number  
%2 = Axis number

**Explanation:** A function has been activated for the axis in JOG mode, e.g. fixed-point approach, JOG to position, JOG in circles, but the axis has not been referenced.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** Reference axis.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**17811 [Channel %1: ] Fixed-point approach not possible for axis %2 in JOG, reason %3**

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number  
%3 = Cause

| <b>Explanation:</b>           | 'Fixed-point approach in JOG' is active for the axis, but another offset motion - for example a synchronization offset \$AA_OFF - has been interpolated simultaneously.<br>The position of the selected fixed-point is not reached if offset values are changed during the traversing motion.<br>The target point then becomes "fixed-point position + change in offset value".<br>The end point will be reached if the traversing motion is restarted after the offset value has been changed.<br>(For example: incremental traversing in which the traversing motion stops intermittently).<br>Reason:<br>Restarting the motion takes the current offset value into account. |

| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                        |
| <b>Remedy:</b>                | Trigger JOG motion again.                                                                                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                        |

---

**17823      [Channel %1: ] Axis %2 JOG to position deactivated**

|                     |                                                                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number                                                                                                                       |
| <b>Explanation:</b> | An axis motion is active for the axis with 'JOG to position' but 'JOG to position' has been deactivated. The approach motion is canceled. |
| <b>Reaction:</b>    | Interface signals are set.<br>Alarm display.                                                                                              |
| <b>Remedy:</b>      | Trigger JOG motion again.                                                                                                                 |

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 17825 Indexing axis %1 \$SA\_JOG\_POSITION unequal indexing position

**Parameters:** %1 = Axis number

**Explanation:** The axis is a referenced indexing axis and 'JOG to position' is activated in JOG mode, but SD43320 \$SA\_JOG\_POSITION does not coincide with an indexing position. In JOG mode, referenced indexing axes approach indexing positions.

**Reaction:** NC not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Modify SD43320 \$SA\_JOG\_POSITION or indexing positions.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

### 17830 [Channel %1: ] JOG in a circle is activated, but the axis %2 required for this is not a geometry axis.

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number

**Explanation:** The function JOG in circles has been activated, but the axis required for this has not been defined as a geometry axis.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** Define axis as geometry axis.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 17831 [Channel %1: ] JOG a circle is not possible, reason %2

**Parameters:** %1 = Channel number  
%2 = Cause

**Explanation:** The JOG in circles function was activated, but this is not possible because:

1. The current positions of the axes involved lie outside the selected pitch circle.
2. The current positions of the axes involved, with pitch circle selected and tool radius offset active, are too near to the center of the circle.
3. The current positions of the axes involved, with tool radius offset active, are too near to the limiting circle during internal machining.
4. The current positions of the axes involved, with tool radius offset active, are too near to the limiting circle during external machining.
5. The current positions of the axes involved in internal machining are outside the defined circle.
6. The current positions of the axes involved in external machining are inside the defined circle.
10. A rotation is acting on the current plane, that is the current plane is inclined in space. This is not currently supported.
20. JOG Retract is active. This mode is not supported.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** Define axis as geometry axis.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 17833 [Channel %1: ] JOG a circle is active and JOG circles deactivated

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number

|                                   |                                                                                                         |
|-----------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>               | A circular motion is active but 'JOG in circles' has been deactivated. The circular motion is canceled. |
| <b>Reaction:</b>                  | Interface signals are set.<br>Alarm display.                                                            |
| <b>Remedy:</b>                    | Reactivate 'JOG circles' and trigger JOG motion again.                                                  |
| <b>Programm<br/>continuation:</b> | Clear alarm with the Delete key or NC START.                                                            |

---

**17900 [Channel %1: ] Block %2 motion synchronous action: %3 axis %4 is not a machine axis**

|                                   |                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>                | %1 = Channel number<br>%2 = Block number, line number<br>%3 = Synact ID<br>%4 = Axis name                                                                                                                                                                                                                                                                     |
| <b>Explanation:</b>               | At this point, the block context calls for a machine axis. This is the case with:<br>- G74 (reference point approach)<br>- G75 (fixed point approach)<br>- PRESETON/PRESETONS on GANTRY synchronous axis<br>If a geometry or special axis identifier is used, then it must also be permitted as machine axis identifier (MD10000 \$MN_AXCONF_MACHAX_NAME_TAB) |
| <b>Reaction:</b>                  | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                    | Use machine axis identifier when programming.                                                                                                                                                                                                                                                                                                                 |
| <b>Programm<br/>continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                          |

| <b>Explanation:</b>           | There is an error in the definition of the protection area. The error number gives the specific reason for the alarm.<br>No.    Meaning<br>1:    Incomplete or conflicting contour definition.<br>2:    Contour encompasses more than one surface area.<br>3:    Tool-related protection area is not convex.<br>4:    If both boundaries are active in the 3rd dimension of the protection area and both limits have the same value.<br>5:    The number of the protection area does not exist (negative number, zero or greater than the maximum number of protection areas).<br>6:    Protection area definition consists of more than 10 contour elements.<br>7:    Tool-related protection area is defined as inside protection area.<br>8:    Incorrect parameter used.<br>9:    Protection area to be activated is not defined.<br>10:    Incorrect modal G code used for protection area definition.<br>11:    Contour definition incorrect or frame activated.<br>12:    Other, not further specified errors. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>An error has occurred on activating the protection area. The error number gives the specific reason for the alarm.</p> <p>No.    Meaning</p> <p>1:    Incomplete or conflicting contour definition.</p> <p>2:    Contour encompasses more than one surface area.</p> <p>3:    Tool-related protection area is not convex.</p> <p>4:    If both boundaries are active in the 3rd dimension of the protection area and both limits have the same value.</p> <p>5:    The number of the protection area does not exist (negative number, zero or greater than the maximum number of protection areas).</p> <p>6:    Protection area definition consists of more than 10 contour elements.</p> <p>7:    Tool-related protection area is defined as inside protection area.</p> <p>8:    Incorrect parameter used.</p> <p>9:    Protection area to be activated is not defined or number of contour element &lt;2 or &gt;MAXNUM_CONTOURNO_PROTECTAREA.</p> <p>10:    Error in internal structure of the protection areas.</p> <p>11:    Other, not further specified errors.</p> <p>12:    The number of simultaneously active protection areas exceeds the maximum number (channel-specific machine data).</p> <p>13,14:    Contour element cannot be created for protection areas.</p> <p>15,16:    No more memory space for the protection areas.</p> <p>17:    No more memory space for the contour elements.</p> <p>18:    The product of simultaneously activated or preactivated workpiece-related protection areas and tool-related protection areas is greater than 31.</p> <p>        Example: 16 workpiece-related and 1 tool-related protection area can be active.</p> <p>                The number of workpiece-related protection areas can then be increased, for example, to 19 (<math>19 * 1 = 19</math>).</p> <p>                However, the number of tool-related protection areas cannot be increased to 2 (<math>16 * 2 = 32</math>).</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>If the alarm is output on ramp-up (2nd parameter: "INIT" instead of block number), "Channel not ready to operate" will be set.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Remedy:</b>                | <p>Please inform the authorized personnel/service department.</p> <p>1. Reduce the number of simultaneously active protection areas (MD).</p> <p>2. Modify part program:</p> <ul style="list-style-type: none"><li>- Delete other protection areas.</li><li>- Preprocessing stop.</li></ul> <p>When the alarm occurs during control ramp-up, the system variables \$SN_PA_... have to be corrected for the specified protection area. Afterwards perform a restart. If the erroneous data cannot be recognized, the protection area's immediate activation can be removed, and the system variables of the protection area can be written again by means of NPROTDEF.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p> <p>If the alarm occurs during NC program execution, the current block can be changed. This way, the NPROT parameters can also be adjusted. However, if there is an error in the definition of the protection area, the NC program must be canceled and the definition must be corrected under NPROTDEF.</p> <p>If the alarm occurs on control ramp-up, system variables \$SN_PA_... must be corrected for the specified protection area. This can be done by downloading an Initial.ini file that includes the relevant corrected date. If afterwards a restart is performed again, the alarm will have been removed provided that the data are consistent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>18003</b>       | <b>[Channel %1: ] Block %2 channel-specific protection area %3 cannot be activated. Error code %4</b>                                                 |
| <b>Parameters:</b> | <p>%1 = Channel number</p> <p>%2 = Block number, label</p> <p>%3 = Number of the channel-specific protection area</p> <p>%4 = Error specification</p> |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>An error has occurred on activating the protection area. The error number gives the specific reason for the alarm.</p> <p>No.    Meaning</p> <p>1:    Incomplete or conflicting contour definition.</p> <p>2:    Contour encompasses more than one surface area.</p> <p>3:    Tool-related protection area is not convex.</p> <p>4:    If both boundaries are active in the 3rd dimension of the protection area and both limits have the same value.</p> <p>5:    The number of the protection area does not exist (negative number, zero or greater than the maximum number of protection areas).</p> <p>6:    Protection area definition consists of more than 10 contour elements.</p> <p>7:    Tool-related protection area is defined as inside protection area.</p> <p>8:    Incorrect parameter used.</p> <p>9:    Protection area to be activated is not defined or number of the contour element &lt;2 or &gt;MAXNUM_CONTOURNO_PROTECTAREA.</p> <p>10:   Error in internal structure of the protection areas.</p> <p>11:   Other, not further specified errors.</p> <p>12:   The number of protection areas simultaneously active exceeds the maximum number (channel-specific machine data).</p> <p>13,14: Contour element for protection areas cannot be created.</p> <p>15,16: No more memory space for the protection areas.</p> <p>17:   No more memory space for the contour elements.</p> |
| <b>Reaction:</b>              | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>If the alarm is output on ramp-up (2nd parameter: "INIT" instead of block number), "Channel not ready to operate" will be set.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | <p>Please inform authorized personnel / the service department.</p> <p>1. Reduce the number of simultaneously active protection areas (MD).</p> <p>2. Modify part program:</p> <ul style="list-style-type: none"> <li>- Delete other protection areas.</li> <li>- Preprocessing stop.</li> </ul> <p>When the alarm occurs on control ramp-up, system variables \$SC_PA_... must be corrected for the specified protection area. Afterwards perform a restart. If the erroneous data cannot be recognized, the protection area's immediate activation can be removed, and the system variables of the protection area can be written again by means of CPROTDEF.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Programm continuation:</b> | <p>Clear alarm with NC START or RESET key and continue the program.</p> <p>The current block can be changed if the alarm occurs during NC program execution. The CPROT parameters can also be adjusted. However, if the error lies in the definition of the protection area, the NC program must be canceled and the definition corrected under CPROTDEF.</p> <p>If the alarm occurs on control power-up, the system variables \$SC_PA_... must be corrected for the specified protection area. This can be done by downloading an Initial.ini file that includes the relevant corrected data. If another restart is then made, the alarm will have been eliminated provided that the data are now consistent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                     |                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>18004</b>        | <b>[Channel %1: ] Block %2 orientation of workpiece-related protection area %3 does not correspond to the orientation of tool-related protection area %4</b>                                                                                                         |
| <b>Parameters:</b>  | <p>%1 = Channel number</p> <p>%2 = Block number, label</p> <p>%3 = Number of workpiece-related protection area</p>                                                                                                                                                   |
| <b>Explanation:</b> | The orientation of the workpiece-related protection area and the orientation of the tool-related protection area differ. If the protection area number is negative, then this is an NCK protection area.                                                             |
| <b>Reaction:</b>    | <p>Correction block is reorganized.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                      |
| <b>Remedy:</b>      | <ul style="list-style-type: none"> <li>- Modify the protection area definition or do not simultaneously activate protection areas that have different orientations.</li> <li>- Check machine data and modify the protection area definition if necessary.</li> </ul> |

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**18005 [Channel %1: ] Block %2 serious error in definition of NCK-specific protection area %3**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Protection area number

**Explanation:** The protection area definition must be terminated with EXECUTE before a preprocessing stop is performed.

**Reaction:** Correction block is reorganized.  
Local alarm reaction.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify the part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**18006 [Channel %1: ] Block %2 serious error in definition of channel-specific protection area %3**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Protection area number

**Explanation:** The protection area definition must be terminated with EXECUTE before a preprocessing stop is performed.

**Reaction:** Correction block is reorganized.  
Local alarm reaction.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify the part program.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**18100 [Channel %1: ] Block %2 invalid value assigned to FXS[]**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The following values are valid at the present time:  
0: "Deselect traverse against fixed stop"  
1: "Select traverse against fixed stop" valid.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Check the use of permissible values of the program command FXS, and correct the assignment.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**18101 [Channel %1: ] Block %2 invalid value assigned to FXST[]**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Only the range 0.0 - 100.0 is valid at the present time.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Check the use of permissible values of the program command FXST, and correct the assignment.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**18102 [Channel %1: ] Block %2 invalid value assigned to FXSW[]**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Only positive values including zero are valid at the present time.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Check the use of permissible values of the program command FXSW, and correct the assignment.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**18205 [Channel %1: ] Block %2 motion synchronous action: %3 curve table %4 does not exist**

**Parameters:** %1 = Channel number  
%2 = Block number, line number  
%3 = Synact ID  
%4 = Number of curve table

**Explanation:** An attempt was made to use a curve table whose table number is not known in the system lpar.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Change the table number in the program instruction or define the curve table with the desired table number.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**18300 [Channel %1: ] Block %2 frame: fine shift not possible**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Allocation of a fine shift to settable frames or the basic frame is not possible since MD18600 \$MN\_MM\_FRAME\_FINE\_TRANS is not equal to 1.

**Reaction:** Interpreter stop  
Interface signals are set.  
Alarm display.

**Remedy:** Inform the authorized personnel/service department.  
Modify the program or set MD18600 \$MN\_MM\_FRAME\_FINE\_TRANS to 1.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**18310 [Channel %1: ] Block %2 frame: illegal rotation**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Rotations are not possible with NCU global frames.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**18311 [Channel %1: ] Block %2 frame: illegal instruction**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** An attempt was made to read or write a frame which does not exist.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**18312 [Channel %1: ] Block %2 frame: fine shift not configured**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Fine shift must be configured with G58 and G59.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Modify machine data.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**18313 [Channel %1: ] Block %2 frame: illegal switchover of geometry axes**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** It is not allowed to change the geometry axis assignment because the current frame contains rotations.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Change NC program or set other mode with MD10602 \$MN\_FRAME\_GEOAX\_CHANGE\_MODE.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**18314 [Channel %1: ] Block %2 frame: type conflict**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** It is not possible to chain global frames and channel-specific frames. The alarm occurs if a global frame is programmed with a channel axis name and no machine axis on this NCU is assigned to the channel axis. Channel-specific frames cannot be programmed with machine axis names if there is no corresponding channel axis on this NCU.

**20002 [Channel %1: ] Axis %2 zero marker not found****Parameters:** %1 = Channel number

%2 = Axis name, spindle number

**Explanation:** The hardware zero marker of the incremental position encoder or the substitute zero mark of the absolute position encoder is not within a defined section.

Phase 2 of the reference point approach ends when the zero marker of the encoder has been detected after the rising/falling edge of the NC/PLC interface signal DB380x DBX1000.7 (Deceleration reference point approach) has given the trigger start. The maximum distance between the trigger start and the zero marker that follows is defined in the MD34060 \$MA\_REFP\_MAX\_MARKER\_DIST.

The monitor prevents a zero marker signal from being overtraveled and the next being evaluated as reference point signal. (Faulty cam adjustment or excessive delay by the PLC user program).

**Reaction:** NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm.

**Remedy:** Please inform the authorized personnel/service department.

Check the cam adjustment and make sure that the distance is sufficient between the end of the cam and the zero marker signal that follows. The path must be greater than the axis can cover in the PLC cycle time.

Increase the MD34060 \$MA\_REFP\_MAX\_MARKER\_DIST, but do not select a value greater than the distance between the 2 zero markers. This might result in the monitor being switched off.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20003 [Channel %1: ] Axis %2 measuring system error****Parameters:** %1 = Channel number

%2 = Axis name, spindle number

**Explanation:** In a measuring system with distance-coded reference marks, the distance between two adjacent markers has been found to be more than twice the value entered in MD34300 \$MA\_ENC\_REFP\_MARKER\_DIST. The control does not issue the alarm until it has again detected a distance that is too long after having made a 2nd attempt in reverse direction with half the traversing velocity.**Reaction:** NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm.

**Remedy:** Determine the distance between 2 odd reference marks (reference mark interval). This value (which is 20.00 mm on Heidenhain scales) must be entered in MD34060 \$MA\_REFP\_MAX\_MARKER\_DIST.

Check the reference track of the scale including the electronics for the evaluation.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20004 [Channel %1: ] Axis %2 reference mark missing****Parameters:** %1 = Channel number

%2 = Axis name, spindle number

**Explanation:** In the distance-coded length measurement system, 2 reference marks were not found within the defined searching distance (axis-specific MD34060 \$MA\_REFP\_MAX\_MARKER\_DIST).

A reduction cam is not required for distance-coded scales (but an existing cam will be evaluated). The conventional direction key determines the direction of search.

The searching distance MD34060 \$MA\_REFP\_MAX\_MARKER\_DIST, within which the two reference marks are expected is counted commencing at the start point.

**Reaction:** NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm.

**Remedy:** Please inform the authorized personnel/service department.  
Determine the distance between 2 odd reference point markers (reference point marker interval). This value (which is 20.00 mm on Heidenhain scales) must be entered in the MD34060 \$MA\_REFP\_MAX\_MARKER\_DIST.  
Check the reference point track of the scale including the electronics for the evaluation.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

## 20005 [Channel %1: ] Axis %2 reference point approach canceled

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number

**Explanation:** Referencing could not be completed for all stated axes (e.g., cancelation caused by missing servo enable, measuring system switchover, release of direction key, etc.).

In distance-coded measuring systems, the alarm will also be displayed if the value 1 has been set in MD34000 \$MA\_REFP\_CAM\_IS\_ACTIV (reference cams) and one of the conditions stated in the remedy has been fulfilled.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Please inform the authorized service personnel. Check the possible reasons for termination:

- Servo enable missing: NC/PLC interface signal DB380x DBX2.1 (Servo enable)
- Measuring system switchover: NC/PLC interface signal DB380x DBX1.5 / 1.6 (Position measuring system 1/2)
- Traversing key + or - missing: NC/PLC interface signal DB380x DBX4.7 / 4.6 (Traversing keys plus/minus)
- Feed override = 0
- The feed disable is active
- Exact stop not reached within MD36020 \$MA\_POSITIONING\_TIME.
- Drive-side error messages, e.g. reference mark signal, not received

The axis-specific MD34110 \$MA\_REFP\_CYCLE\_NR determines which axes are involved in the channel-specific referencing.

| Value | Meaning                                                                                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -1:   | No channel-specific referencing, NC Start without referencing.                                                                                                                                              |
| 0:    | No channel-specific referencing, NC Start with referencing.                                                                                                                                                 |
| 1-8:  | Channel-specific referencing. The number entered here corresponds to the referencing sequence. (When all axes with contents 1 have reached the reference point, then the axes with contents 2 start, etc.). |

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

## 20006 [Channel %1: ] Axis %2 reference point shutdown velocity not reached

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number

**Explanation:** In phase 2 of reference point approach (wait for zero mark), the cam end was reached but the reference point approach velocity was not within the tolerance window. (This can occur when the axis is already at the end of the cam at the beginning of reference point approach. Phase 1 is therefore considered as being already concluded and will not be started.)  
Phase 2 has been interrupted (this time before the cam) and the reference point approach will be started once again automatically with phase 1. If the approach velocity is not reached at the 2nd attempt either, referencing will be stopped and the alarm displayed.

Approach velocity: MD34040 \$MA\_REFP\_VELO\_SEARCH\_MARKER  
Velocity tolerance: MD35150 \$MA\_SPIND\_DES\_VELO\_TOL.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Please inform the authorized personnel/service department.  
Reduce the MD for the approach velocity MD34040 \$MA\_REFP\_VELO\_SEARCH\_MARKER and/or increase the MD for the velocity tolerance MD35150 \$MA\_SPIND\_DES\_VELO\_TOL.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20007 [Channel %1: ] Axis %2 reference point approach requires 2 measuring systems**

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number

**Explanation:** 2 encoders are needed for setting MD34200 \$MA\_ENC\_REFP\_MODE = 6!

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Inform the authorized personnel/service department.  
Modify the referencing mode for MD34200 \$MA\_ENC\_REFP\_MODE or install and configure a second encoder.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20008 [Channel %1: ] Axis %2 reference point approach requires second referenced measuring system**

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number

**Explanation:** When setting MD34200 \$MA\_ENC\_REFP\_MODE = 6 the 2nd encoder must first be referenced.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Change the referencing mode in MD34200 \$MA\_ENC\_REFP\_MODE or reference the 2nd encoder.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20050 [Channel %1: ] Axis %2 handwheel mode active**

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number

**Explanation:** The axes cannot be traversed in JOG mode using the traversing keys because traversing is still taking place via the handwheel.

**Reaction:** Alarm display.

**Remedy:** Decide whether the axis is to be traversed by means of the direction keys or the handwheel. End handwheel travel and delete the axial distance-to-go if necessary (NC/PLC interface signal DB380x DBX2.2 (Delete distance-to-go/Spindle reset)).

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**20051 [Channel %1: ] Axis %2 handwheel mode not possible**

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number

**Explanation:** The axis is already traveling via the traversing keys, so handwheel mode is no longer possible.

**Reaction:** Alarm display.

**Remedy:** Decide whether the axis is to be traversed by means of the jog keys or via the handwheel.

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>20052</b>                  | <b>[Channel %1: ] Axis %2 already active</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Explanation:</b>           | The axis is to traverse as a machine axis in JOG mode using the direction keys on the machine control panel. However, this is not possible because: <ol style="list-style-type: none"> <li>1. It is already traversing as a geometry axis (through the channel-specific interface DB3200 DBX1000.7 / 0.6 (Traversing keys -/+) or DB3200 DBX1004.7 / 4.6 (Traversing keys -/+) or DB3200 DBX1008.7 / 8.6 (Traversing keys -/+) or</li> <li>2. It is already traversing as a machine axis (through the axis-specific interface DB380x DBX4.7 / 4.6 (Traversing keys plus/minus)) or</li> <li>3. A frame is valid for a rotated coordinate system, and another geometry axis involved in this is already traversing in JOG mode by means of the direction keys.</li> <li>4. As part of a retraction motion (submode JOG-Retract) it cannot be traversed as a machine axis.</li> </ol> |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | Stop traversing through the channel or axis interface or stop the other geometry axis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Remedy:</b>                | Please inform the authorized personnel/service department.<br>If the revolutionary feed is also to be active in JOG mode, a master spindle must be declared via the channel-specific MD20090 \$MC_SPIND_DEF_MASTER_SPIND. In this case you have to open a screen in the PARAMETER operating area with the softkeys "SETTINGDATA" and "JOG DATA" and preselect the G function G95 there. The JOG feedrate can then be entered in [mm/rev]. (If 0 mm/rev is set as JOG feed, the control takes the value assigned in the axis-specific MD 32050 \$MA_JOG_REV_VELO or in the case of rapid traverse overlay MD32040 \$MA_JOG_REV_VELO_RAPID).<br>The revolutionary feed in JOG mode is deactivated by changing the G function from G95 to G94. |

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis name, spindle number                                                                                                                                                                                                                                                                     |
| <b>Explanation:</b>           | Revolutional feed has been programmed for an axis/spindle, but the velocity was not programmed or the programmed value is smaller than or equal to zero.                                                                                                                                                                                              |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Local alarm reaction.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                             |
| <b>Remedy:</b>                | Inform the authorized personnel/service department.<br>You have the following possibilities of canceling the alarm; <ul style="list-style-type: none"><li>- Correct the part program</li><li>- Specify a correct feedrate for PLC axes at the VDI interface,</li><li>- Specify a feedrate for oscillating axes in SD43740 \$SA_OSCILL_VELO.</li></ul> |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                  |

---

|                     |                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>20058</b>        | <b>[Channel %1: ] Axis %2 revolutionary feedrate: illegal feed source</b>                                                                                                                              |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Axis name, spindle number                                                                                                                                                  |
| <b>Explanation:</b> | An axis/spindle is to be traversed at revolutionary feedrate. The reference axis/spindle defined in SD 43300 \$SA_ASSIGN_FEED_PER_REV_SOURCE refers to itself. The coupling caused cannot be executed. |
| <b>Reaction:</b>    | Alarm display.                                                                                                                                                                                         |
| <b>Remedy:</b>      | The reference axis/spindle must be modified accordingly in SD 43300.                                                                                                                                   |

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

### 20059 [Channel %1: ] Axis %2 already active due to %3

**Parameters:** %1 = Channel number  
 %2 = Axis name, spindle number  
 %3 = Cause

**Explanation:** The axis (machine axis, geometry axis or orientation axis) is to be traversed in operation mode "Automatic&Jog" (see MD10735 \$MN\_JOG\_MODE\_MASK) by using the direction keys or a handwheel. This is not possible, as (see parameter 3):

1. the axis is active as a rotating spindle
2. the axis is a PLC axis
3. the axis is active as an asynchronous reciprocating axis
4. the axis is active as a command axis
5. the axis is active as a slave axis
6. a frame applies for a rotated coordinate system and an axis involved in the required JOG movement of the geometry axis is not available for this
7. an axis container rotation is activated via NCU link

Note: This alarm identifies an axis not capable of JOG which received a JOG order. In this case, the NCK will not proceed according to "Internal JOG".

**Reaction:** Alarm display.

**Remedy:** Wait for the axis to traverse or cancel with distance-to-go delete or RESET.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 20060 [Channel %1: ] Axis %2 cannot be traversed as geometry axis

**Parameters:** %1 = Channel number  
 %2 = Axis name

**Explanation:** The axis is currently not in "Geometry axis" state. Therefore, it cannot be traversed in JOG mode as geometry axis. If the word Work (WCS = workpiece coordinate system) is displayed in the "Position" screen, only the geometry axes can be traversed by means of the direction keys! (MCS ... Machine coordinate system; all machine axes can now be traversed by using the direction keys on the machine control panel).

**Reaction:** Alarm display.

**Remedy:** Check the operating steps to establish whether geometry axes really must be traversed, otherwise switch over to the machine axes by activating the "Work/Machine" key on the machine control panel.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### 20062 [Channel %1: ] Axis %2 already active

**Parameters:** %1 = Channel number  
 %2 = Axis name, spindle number

**Explanation:** The displayed axis is already traversing as a machine axis. Therefore, it cannot be operated as a geometry axis. Traversing an axis can take place in JOG mode through 2 different interfaces.

1. As a geometry axis: via the channel-specific interface DB3200 DBX1000.7 / 0.6 (Traversing keys +/-)
2. As a machine axis: via the axis-specific interface DB380x DBX4.7 / 4.6 (Traversing keys plus/minus)

With the standard machine control panel, it is not possible to operate an axis as a machine axis and as a geometry axis at the same time.

**Reaction:** Alarm display.

**Remedy:** Do not start the geometry axis until the traversing motion as machine axis has been concluded.

**Programm continuation:** Clear alarm with the Delete key or NC START.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>20064</b>                  | <b>[Channel %1: ] Axis %2 selection of several axes with an active taper angle is not permitted.</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | With an active taper angle, only one geometry axis at the time can be traversed in JOG mode by pressing traversing keys. Simultaneous traversing of a geometry axis as a machine axis is not permitted either.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Reaction:</b>              | NC not ready.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Remedy:</b>                | Starting the geometry axis only if traversing of the other geometry axis or machine axis completed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. | <b>Explanation:</b>           | The displayed axis is to be traversed as geometry axis in JOG mode with rotary feed, but no master spindle has been defined from which the actual speed could be derived.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Reaction:</b>              | Local alarm reaction.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Remedy:</b>                | If the revolutional feedrate is to be active in JOG mode too, then a master spindle must be declared in the channel-specific machine data MD20090 \$MC_SPIND_DEF_MASTER_SPIND. In this case, you have to open a screen in the PARAMETER operating area with the softkeys "SETTINGDATA" and "JOG DATA", and preselect the G function G95 there. The JOG feedrate can then be entered in [mm/rev]. (If 0 mm/rev is set as JOG feedrate, the control takes the value assigned in the axis-specific machine data MD32050 \$MA_JOG_REV_VELO or in the case of rapid traverse override MD32040 \$MA_JOG_REV_VELO_RAPID).<br>The revolutional feedrate in JOG mode is deactivated by changing the G function from G95 to G94. |

| <b>Explanation:</b>           | The axis is to be traversed by the PLC as a concurrent positioning axis to the limit position. This would violate the corresponding software limit switch for the axis. No traversing takes place.<br>With an additional message to alarm 20140, the axis is to be traversed as a command axis.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Specify smaller target position. Modify MD for SW limit switch. Possibly activate another SW limit switch. Retract axis via JOG.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 20073 [Channel %1: ] Axis %2 cannot be repositioned

|                               |                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis number                                                                                                                                                                                                  |
| <b>Explanation:</b>           | The concurrent positioning axis cannot be positioned because it has already been restarted via the VDI interface and is still active. No repositioning motion takes place and the motion initiated by the VDI interface is not affected. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                           |
| <b>Remedy:</b>                | None.                                                                                                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                             |

---

### 20075 [Channel %1: ] Axis %2 can currently not oscillate

|                               |                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis number                                                                      |
| <b>Explanation:</b>           | The axis cannot perform an oscillating movement now because it is already being traversed, e.g. in JOG mode. |
| <b>Reaction:</b>              | Alarm display.                                                                                               |
| <b>Remedy:</b>                | End the other traversing motion.                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                 |

---

### 20076 [Channel %1: ] Axis %2 oscillating - mode change not possible

|                     |                                                                                                                                      |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Axis number                                                                                              |
| <b>Explanation:</b> | The axis is performing an oscillating movement. Mode change is not possible because oscillation is not allowed in the selected mode. |

|                               |                                                                                                                                                                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                   |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Do not initiate mode change. Cause the PLC to check the axis and make sure in the PLC program that the axis ends oscillation if such mode changes take place. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                     |

---

**20077 [Channel %1: ] Axis %2 programmed position %4 is behind software limit switch %3**

|                               |                                                                                                                                                                                                |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis number<br>%3 = "+" or "-"<br>%4 = Target position                                                                                                             |
| <b>Explanation:</b>           | The axis is traversed as an oscillating axis and the target position (reversal position or end position) is located behind the corresponding software limit switch. The axis is not traversed. |
| <b>Reaction:</b>              | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                |
| <b>Remedy:</b>                | Specify smaller target position.<br>Modify MD for SW limit switch.<br>Possibly activate another SW limit switch.                                                                               |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                           |

| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                       |

---

**20079 [Channel %1: ] Axis %2 oscillation path %3 <= 0**

|                     |                                                                                                                                                                                                                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Axis number<br>%3 = Length                                                                                                                                                                                                                                                                |
| <b>Explanation:</b> | The axis is traversed as an oscillating axis and the distance to be traversed is smaller than or equal to zero. For example, both reversal points are situated on an identical position, one reversal point was shifted against the oscillating direction beyond the other reversal point. The axis is not traversed. |

|                               |                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm. |
| <b>Remedy:</b>                | Specify correct target position (reversal position, end position).                                                              |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                            |

---

**20080 [Channel %1: ] Axis %2 no handwheel assigned for override**

|                               |                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis number                                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b>           | No handwheel has been assigned for this specified axis after handwheel overlay has been started in automatic mode. If the axis identifier is missing in the alarm with active velocity overlay $FD > 0$ , then the 1st geometry axis has not been defined in the NC channel. In this case the block is executed without handwheel control. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | If handwheel control is required, a handwheel must be activated.                                                                                                                                                                                                                                                                           |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                                                                                                                     |

---

**20082 [Channel %1: ] Axis %2 coordinate system-specific working area limit %3 end position %4**

|                               |                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis number<br>%3 = "+" or "-"<br>%4 = End position                                                                                                                                                                                                             |
| <b>Explanation:</b>           | The displayed axis is operated as a "concurrent positioning axis", and the corresponding active coordinate system-specific working area limitation for the axis is violated. No traversing movement.<br>With an additional message to alarm 20140, the axis is traversed as a command axis. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | - Specify smaller target position.<br>- Deactivate working area limitation.<br>- Set working area limitation differently.<br>- Retract axis with JOG.                                                                                                                                       |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                                                                      |

---

**20083 [Channel %1: ] Axis %2 programmed position %4 lies behind the coordinate system-specific working area limit %3**

|                     |                                                                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Axis number<br>%3 = "+" or "-"<br>%4 = End position                                                                                                                                                       |
| <b>Explanation:</b> | The axis is traversed as a reciprocating axis, and the target position (reversal position or end position) is located behind the corresponding, valid, coordinate system-specific working area limitation. The axis is not traversed. |
| <b>Reaction:</b>    | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                       |

**Remedy:** Specify smaller target position.  
Deactivate working area limitation.  
Set working area limitation differentially.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20085 [Channel %1: ] Contour handwheel: traverse direction or overtravel of beginning of block not allowed**

**Parameters:** %1 = Channel number

**Explanation:** Travel takes place on the path with the contour handwheel in the opposite direction to the programmed travel direction and the starting point of the path has been reached at the start of the block.

**Reaction:** Alarm display.

**Remedy:** Turn the contour handwheel in the opposite direction.

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**20090 Axis %1 travel to fixed stop not possible. Check programming and axis data.**

**Parameters:** %1 = Axis name, spindle number

**Explanation:** 1. The "Traverse against fixed stop" function has been programmed with FXS[AX]=1 but the axis does not (yet) support this. Check MD37000 \$MA\_FIXED\_STOP\_MODE. This function is not available for gantry axes and simulated axes.  
2. On selection, no movement was programmed for axis AX. AX is a machine axis identifier.  
3. It is always necessary to program a traversing movement in the selection block for the axis/spindle for which the "Traverse against fixed stop" function is activated.  
The alarm can be reprogrammed in the MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY (channel not ready).

**Reaction:** Mode group not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.  
Channel not ready.

**Remedy:** Please inform the authorized personnel/service department.  
- Check the axis type.  
- Check MD37000 \$MA\_FIXED\_STOP\_MODE.  
- Is a machine axis movement missing in the approach block?

**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

---

**20091 Axis %1 has not reached fixed stop**

**Parameters:** %1 = Axis name, spindle number

**Explanation:** On attempting to traverse against a fixed stop, the programmed end position has been reached or the traversing movement has been canceled. The alarm can be concealed by means of the MD37050 \$MA\_FIXED\_STOP\_ALARM\_MASK.  
The alarm can be reprogrammed in the MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY (channel not ready).

**Reaction:** Mode group not ready.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.  
Channel not ready.

**Remedy:** Correct the part program and the settings:

- Has the traversing block been canceled?
- If the axis position does not correspond to the programmed end position, then correct the end position.
- If the programmed end position is in the part, the triggering criterion must be checked.
- Has the contour deviation leading to triggering been dimensioned too large? Has the torque limit been set too high?

**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

## 20092 Axis %1 travel to fixed stop still active

**Parameters:** %1 = Axis name, spindle number

**Explanation:** An attempt has been made to move an axis while it is in fixed stop or while the deselection function has not yet been completed.

The alarm can be reprogrammed in the MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY (channel not ready).

**Reaction:** Mode group not ready.

Channel not ready.

NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm.

Channel not ready.

**Remedy:** Please inform the authorized personnel/service department.

Check the following:

- Has the axis at the fixed stop also been moved by a traversing movement of geometry axes?
- Is a selection carried out even though the axis is stationary at the stop?
- Has the deselection process been interrupted by a RESET?
- Has the PLC switched the acknowledgment signals?

**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

## 20093 Axis %1 standstill monitoring at fixed-stop end point has been triggered

**Parameters:** %1 = Axis name, spindle number

**Explanation:** The position of the axis has been beyond the zero speed window ever since selection has been completed.

The alarm can be reprogrammed in the MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY (channel not ready).

**Reaction:** Mode group not ready.

Channel not ready.

NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm.

Channel not ready.

**Remedy:** Please inform the authorized personnel/service department.

- Check the mechanical components, e.g. has the stop broken away? Has the part to be clamped given way?
- Position window for zero speed control too small (MD37020 \$MA\_FIXED\_STOP\_WINDOW\_DEF) (SD43520 \$SA\_FIXED\_STOP\_WINDOW). Default is 1 mm in each case.

**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

## 20094 Axis %1 function has been canceled

**Parameters:** %1 = Axis name, spindle number

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The function has been canceled. The possible reasons for this are: <ul style="list-style-type: none"><li>- The torque can no longer be provided because a pulse disable has occurred, .</li><li>- The PLC has removed the acknowledgments.</li></ul> The system variable \$VA_FXS_INFO contains additional information regarding why the function was canceled. The alarm can be reprogrammed in the MD11412 \$MN_ALARM_REACTION_CHAN_NOREADY (channel not ready). |
| <b>Reaction:</b>              | Mode group not ready.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Channel not ready.                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | Check whether <ul style="list-style-type: none"><li>- there is a pulse disable from the infeed/regenerative-feedback unit or from the PLC?</li><li>- the acknowledgment bits have been deleted by the PLC even though NCK has not requested deselection?</li></ul> Read out the system variable \$VA_FXS_INFO, and then interpret the additional information.                                                                                                      |
| <b>Programm continuation:</b> | Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                                                                                                                                                                                                                                                                                                                                     |

**20124      Axis %1: sum of compensation values too large**

|                               |                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number                                                                                                                                                                       |
| <b>Explanation:</b>           | The sum of the compensation values from all tables assigned to the axis had exceeded the limit value MD32720 \$MA_CEC_MAX_SUM and had to be limited. Contour errors could have occurred as a result. |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                                         |
| <b>Remedy:</b>                | Check characteristic data of the compensation tables assigned to the axis.<br>Check characteristic curves in the tables (\$AN_CEC).                                                                  |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                 |

---

**20125      Axis %1: change of compensation value is too rapid**

|                               |                                                                                                                                                                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number                                                                                                                                                                                          |
| <b>Explanation:</b>           | The compensation value has changed more rapidly than has been allowed for in MD32730 \$MA_CEC_MAX_VELO. It had to be limited temporarily. The missing section is repeated later but contour errors might have occurred. |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                                                            |
| <b>Remedy:</b>                | Check characteristic data of the compensation tables assigned to the axis.<br>Check characteristic curves in the tables (\$AN_CEC). Possibly one of the input axes has moved more rapidly than provided for.            |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                  |

---

**20130      [Channel %1: ] Contour tunnel monitoring**

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Explanation:</b> | The tool tip has exited the tunnel placed around the desired contour, i.e. the distance between tool tip and desired contour was greater than specified in the MD21050 \$MC_CONTOUR_TUNNEL_TOL.<br>The alarm can be reprogrammed in the MD11412 \$MN_ALARM_REACTION_CHAN_NOREADY (channel not ready).                                                                                                                                           |
| <b>Reaction:</b>    | Mode group not ready.<br>The NC switches to follow-up mode.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Channel not ready.                                                                                                                                                                                                                               |
| <b>Remedy:</b>      | Please inform the authorized personnel/service department. Check the following points in turn:<br>1. Is the machine in working order? That is, has the alarm been tripped by a sluggish axis, tool breakage or collision?<br>2. If the machine is in working order, reduce the velocity or improve the controller setting.<br>3. Possibly increase the size of the tunnel and monitor errors via analog output in order to ascertain the cause. |

**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

---

**20138 [Channel %1: ] Block %2 motion synchronous action %3 command axis %4 cannot be traversed**

**Parameters:** %1 = Channel number  
 %2 = Block number, line number  
 %3 = Synact ID  
 %4 = Axis name

**Explanation:** The axis that should be traversed out of a synchronized action is not available  
 The following causes are possible:

- The axis is being or will be traversed by the NC program.  
 This motion can also be made indirectly by means of continuous-path mode or an active frame.
- The axis can be actively assigned on account of a function (e.g. programming of the servo-parameter set).
- A superimposed motion is active for the axis.
- The axis is active as a following axis of a coupling.
- An interpolatory compensation, such as temperature compensation, is active for the axis.

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.

**Remedy:** Modify part program.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20139 [Channel %1: ] Block %2 motion synchronous action: %3 invalid marker**

**Parameters:** %1 = Channel number  
 %2 = Block number, line number  
 %3 = Synact ID

**Explanation:** Setting or deleting of a marker in the motion-synchronous action is not possible.  
 Possible causes:  
 SETM(): Maximum number of markers exceeded; marker has already been set.  
 CLEARM(): Specified marker is not within permissible value range.

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.

**Remedy:** SETM(): use marker in valid value range; do not set the marker again.  
 CLEARM(): use marker in valid value range.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20140 [Channel %1: ] Traversing of command axis %2 see NC alarm %3 parameter %4**

**Parameters:** %1 = Channel number  
 %2 = Axis  
 %3 = NC alarm  
 %4 = Additional parameter

**Explanation:** An NC alarm was detected for a command axis, which is to be traversed from a synchronized action. This alarm is output in the 3rd parameter as an HMI alarm number. Parameter 4 may provide additional information.

|                               |                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm. |
| <b>Remedy:</b>                | See help information for the additional alarms.                                                        |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                   |

---

**20141 [Channel %1: ] Block %2 motion synchronous action: %3 axis %4 has illegal axis type**

|                               |                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, line number<br>%3 = Synact ID<br>%4 = Axis name                                                                                                                                                                                                           |
| <b>Explanation:</b>           | The requested command is not permissible in the current axis status for the command axis or spindle. This alarm occurs with command axes (POS, MOV), spindle commands from motion synchronous actions (M3/M4/M5, SPOS), coupled motion (TRAILON, TRAILOF) and lead value coupling (LEADON, LEADOF). |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                              |
| <b>Remedy:</b>                | First stop the axis or deactivate the coupling, then select a new status.                                                                                                                                                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                |

---

**20143 [Channel %1: ] Block %2 motion synchronous action: %3 command axis %4 cannot be started as it is controlled by the PLC**

|                               |                                                                                                                                                                            |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, line number<br>%3 = Synact ID<br>%4 = Axis name                                                                                  |
| <b>Explanation:</b>           | An attempt has been made to start a command axis by means of a block-related or modal synchronous action. This start is not possible as the axis is controlled by the PLC. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                             |
| <b>Remedy:</b>                | End control of the axis by the PLC and therefore return it to the channel or start the command axis with a static synchronous action.                                      |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                               |

---

**20144 [Channel %1: ] Block %2 motion synchronous action: %3 system variable cannot be accessed**

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, line number<br>%3 = Synact ID                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Explanation:</b> | When using system variables, it is assumed that a read/write operation can access the required data successfully. In accesses to encoder actual values or digital I/Os, the result depends on the availability of the corresponding hardware components. If an access within synchronized actions does not return a valid value, alarm 20144 is output. Outside synchronized actions, such a read/write access causes block execution to be interrupted until the result is available. Block execution is subsequently continued. |
| <b>Reaction:</b>    | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Remedy:** Before reading/writing system variables, ensure that it is possible to access, for example, the required hardware components.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20145 [Channel %1: ] Block %2 motion synchronous action: %3 arithmetic error**

**Parameters:** %1 = Channel number  
%2 = Block number, line number  
%3 = Synact ID

**Explanation:** In calculating an arithmetic expression for a motion synchronous action, an overflow has occurred (e.g. division by zero).

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Correct the incorrect expression.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20146 [Channel %1: ] Block %2 motion synchronous action: %3 nesting depth exceeded**

**Parameters:** %1 = Channel number  
%2 = Block number, line number  
%3 = Synact ID

**Explanation:** For calculating arithmetic expressions in motion synchronous blocks, an operand stack with a fixed set size is used. With very complex expressions, this stack can overflow.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Correct the incorrect expression.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20147 [Channel %1: ] Block %2 motion synchronous action: %3 command %4 not executable**

**Parameters:** %1 = Channel number  
%2 = Block number, line number  
%3 = Synact ID  
%4 = Program command

**Explanation:** One of the commands in the synchronized action block cannot be executed, e.g. it is not possible to perform a Reset for the specific synchronized action.

Measurement level 2

- Embargo version does not allow measurement from a synchronized action
- The MEASA command was programmed in a synchronized action
- Measurement is already active
- Programming error (see alarm 21701)

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Change the synchronized action.  
Measurement level 2  
Execute the measurement task from a part program first, in order to improve the error diagnostics. Do not include the measurement in the synchronized action until the first error-free run has been performed .

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20148 [Channel %1: ] Block %2 motion synchronous action: %3 internal error %4**

**Parameters:** %1 = Channel number  
%2 = Block number, line number  
%3 = Synact ID  
%4 = Error code

**Explanation:** An internal error has occurred during processing of a synchronous action. The error code is for diagnostics purposes. Please make a note and contact the manufacturer.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Change the synchronized action.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20149 [Channel %1: ] Block %2 motion-synchronous action: %3 Index %4 is illegal**

**Parameters:** %1 = Channel number  
%2 = Block number, line number  
%3 = Synact ID  
%4 = Index

**Explanation:** An invalid index was used to access a variable in the motion-synchronized action. The invalid index is also displayed.  
Example: ... DO \$R[\$AC\_MARKER[1]] = 100

The error occurs if the value of marker 1 is greater than the maximum permissible R-parameter number.

PROFIBUS/PROFINET I/O:

An invalid slot / I/O area index was used while reading/writing data.

Cause:

- 1.: Slot / I/O area index  $\geq$  max. number of available slots / I/O areas.
- 2.: Slot / I/O area index references a slot / I/O area that has not been configured.
- 3.: Slot / I/O area index references a slot / I/O area that has not been released for system variables.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Use a valid index.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20150 [Channel %1: ] Tool management: PLC terminates interrupted command**

**Parameters:** %1 = Channel number

**Explanation:** Indication that the PLC has terminated an interrupted command (with alarm output) from the tool management - tool change.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** This alarm is for information only.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### **20160 [Channel %1: ] Tool management: PLC can terminate only incorrectly canceled commands**

**Parameters:** %1 = Channel number

**Explanation:** Note that the PLC wanted to interrupt an active command from the tool management (tool change), or that there is no active command to cancel.

The NCK rejects for the following reasons:

- Channel status is "active". Cancel is not allowed,
- Channel status is "reset". Nothing can be canceled.

**Reaction:** Interface signals are set.

Alarm display.

**Remedy:** This alarm is for information only.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### **20170 [Channel %1: ] Machine data \$AC\_FIFO invalid**

**Parameters:** %1 = Channel number

**Explanation:** The structure of the FIFO variable \$AC\_FIFO1 - \$AC\_FIFO10 specified by the machine data MD28260 \$MC\_NUM\_AC\_FIFO, MD28262 \$MC\_START\_AC\_FIFO, MD28264 \$MC\_LEN\_AC\_FIFO and MD28266 \$MC\_MODE\_AC\_FIFO cannot be stored in the R parameter field defined in MD28050 \$MC\_MM\_NUM\_R\_PARAM.

**Reaction:** NC Start disable in this channel.

Interface signals are set.

Alarm display.

**Remedy:** Inform the authorized personnel/service department.

Increase the number of R-parameters or reduce the number of FIFO elements.

Set the MD as follows: MD28050 \$MC\_MM\_NUM\_R\_PARAM = MD28262 \$MC\_START\_AC\_FIFO + MD28260 \$MC\_NUM\_AC\_FIFO \* (MD28264 \$MC\_LEN\_AC\_FIFO + 6)

**Programm continuation:** Switch control OFF - ON.

---

### **20200 [Channel %1: ] Invalid spindle number %2 with tool fine compensation**

**Parameters:** %1 = Channel number target channel

%2 = Spindle number

**Explanation:** There is no spindle/axis assignment in the target channel for the spindle specified in the PUTFTOC command.

**Reaction:** Interpreter stop

NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm.

**Remedy:** Modify program in channel that writes the tool fine compensation.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

### **20201 [Channel %1: ] Spindle %2 no tool assigned**

**Parameters:** %1 = Channel number

%2 = Spindle number

**Explanation:** In order to make allowance for the fine tool compensation for the tool currently in the spindle, a spindle/tool assignment must be active. This is not presently the case for the programmed spindle in the target channel of fine tool compensation.

|                               |                                                                                                                                                                                 |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                      |
| <b>Remedy:</b>                | 1. Modify the part program (write the tool fine compensation).<br>2. Establish spindle/tool assignment by programming:<br>- TMON (tool monitoring)<br>- GWPSON (tool selection) |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                            |

---

**20203 [Channel %1: ] No active tool**

|                               |                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number                                                                                                                                                          |
| <b>Explanation:</b>           | A tool fine compensation has been written for the active tool of channel %1 with PUTFTOC. No tool is active in this channel. Therefore, the compensation cannot be assigned. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                   |
| <b>Remedy:</b>                | Correct the program.                                                                                                                                                         |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                         |

---

**20204 [Channel %1: ] PUTFTOC command not allowed with FTOCOF**

|                               |                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number                                                                                                                                                                                  |
| <b>Explanation:</b>           | A tool fine compensation has been written for channel %1 with PUTFTOC. The tool fine compensation is not active in this channel. FTOCON must be active in the target channel of the PUTFTOC command. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                           |
| <b>Remedy:</b>                | Correct the program in the machining channel: Select FTOCON so that the channel is ready to receive the PUTFTOC command.                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                 |

---

**20205 [Channel %1: ] Block %2 motion synchronous action: %3 invalid spindle number %4**

|                     |                                                                                                               |
|---------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number target channel<br>%2 = Block number, line number<br>%3 = Synact ID<br>%4 = Spindle number |
| <b>Explanation:</b> | There is no spindle/axis assignment in the target channel for the specified spindle.                          |
| <b>Reaction:</b>    | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.        |
| <b>Remedy:</b>      | Modify program.                                                                                               |

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**20302 [Channel %1: ] Axis %2 cannot be traversed**

**Parameters:** %1 = Channel number

%2 = Axis name, spindle number

**Explanation:** The displayed axis cannot be traversed as a machine axis because JOG Retract mode has been selected in JOG mode.

**Reaction:** Alarm display.

**Remedy:** Deselect JOG Retract with RESET

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**20304 [Channel %1: ] Axis %2 cannot be traversed as a geometry axis**

**Parameters:** %1 = Channel number

%2 = Axis name, spindle number

**Explanation:** The displayed axis cannot be traversed as a geometry axis. The geometry axis is part of a retraction motion in JOG Retract mode. The requested motion of the geometry axis would lead to a violation of the permitted retraction direction.

**Reaction:** Alarm display.

**Remedy:** Deselect JOG Retract with RESET

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**20306 [Channel %1: ] Cartesian manual traverse not possible**

**Parameters:** %1 = Channel number

%2 = Axis name, spindle number

**Explanation:** Cartesian manual traverse is not possible in JOG Retract mode.

**Reaction:** Alarm display.

**Remedy:** Deselect JOG Retract with RESET

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**20308 [Channel %1: ] Manual traverse in the SZS coordinate system is not possible**

**Parameters:** %1 = Channel number

%2 = Axis name, spindle number

**Explanation:** Manual traverse in the SZS coordinate system is not possible in JOG Retract mode.

**Reaction:** Alarm display.

**Remedy:** Deselect JOG Retract with RESET

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**20310 [Channel %1: ] Axis %2 traverse to the specified position is not possible**

**Parameters:** %1 = Channel number

%2 = Axis name, spindle number

**Explanation:** The displayed axis cannot be traversed to the entered position in JOG Retract mode. It is limited to the interrupt position when JOG Retract was selected.

**Reaction:** Alarm display.

**Remedy:** Traverse within the permitted positions

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>21550</b>                  | <b>[Channel %1: ] Axis %2 Travel from hardware limit switch not possible. Reason: %3</b>                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name<br>%3 = Cause                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Explanation:</b>           | It has been tried to retract a following axis of an axis coupling or an output axis of a transformation through the master axis or input axis of a transformation. This is not permitted in the current situation.<br>Possible reasons:<br>1 No permissible direction of retraction<br>2 Coupling not synchronous<br>3 Retraction not permitted for the active coupling<br>4 Reserved<br>5 Retraction not permitted for the active transformation      |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Explanation:</b>           | Causes of alarm:<br>0: The cause of the alarm cannot be precisely determined.<br>1: The interface signal DB380x DBX2.1 (Servo enable) is missing<br>2: The interface signal DB380x DBX4001.7 (Pulse enable) is missing<br>3: Drive signal DB390x DBX4001.7 (Impulses enabled) is not set<br>4: Drive signal DB390x DBX4001.5 (Drive ready) is not set<br>5: Drive signal DB390x DBX4000.4 (Autonomous drive) does not follow the NC setpoints<br>One of the motion-enabling signals (e.g. "Servo enable", "Pulse enable", parking/encoder selection (only for axes) or drive-specific enables has been reset for the displayed axis. The alarm can be reported with positioning axes, spindles and for axes from the geometry grouping.<br>The axes entered in the channel-specific MD array MD20050 \$MC_AXCONF_GEOAX_ASSIGN_TAB are regarded as axes belonging to the geometry grouping. Servo enable must exist for all available geometry axes, regardless of whether or not they are currently in motion.<br>Occurs in connection with SAFETY function: If a test stop is performed with linked axes, the alarm is issued if a motion command from the ELG grouping is pending during the test stop of the following axis. |
| <b>Reaction:</b>              | The NC switches to follow-up mode.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department.<br>Check the interface signals DB380x DBX2.1 (Servo enable), DB380x DBX4001.7 (Pulse enable), check the drive signals DB390x DBX4001.7 (Pulses enabled), DB390x DBX4001.5 (Drive ready) for example with the PLC status display in the DIAGNOSTICS operating area. Check the encoder selection (for axes) as well as other signals enabling motion according to the drive type used.<br>When the terminal enables of the drive have failed, trace back the wiring or hardware function (for example relay function) or proceed as stated in the relevant drive documentation.<br>With SAFETY: With active actual-value linkage, output of the error message on the slave axis can be prevented by increasing MD36060 \$MA_STANDSTILL_VELO_TOL (default value is 5 mm).                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

---

**21614 [Channel %1: ] Axis %2 hardware limit switch %3**

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number  
%3 = String (+, - or +/-)

**Explanation:** The signal DB380x DBX1000.1 und .0 (Hardware limit switch plus/minus) has been set at the NC/PLC interface.

**Reaction:** NC Start disable in this channel.  
Alarm display.

**Remedy:** Please inform the authorized personnel/service department.  
1. With axes that have already been referenced, the software limit switch 1 or 2 should respond before the hardware limit switch is reached. Check MD36110 \$MA\_POS\_LIMIT\_PLUS, MD36100 \$MA\_POS\_LIMIT\_MINUS, MD36130 \$MA\_POS\_LIMIT\_PLUS2 and MD36120 \$MA\_POS\_LIMIT\_MINUS2 and the NC/PLC interface signal for the selection DB380x DBX1000.3 / 1000.2 (1st/2nd software limit switch plus/minus) and correct, if necessary (PLC user program).  
2. If the axis has not yet been referenced, it is possible to depart from the hardware limit switch in the opposite direction in JOG mode.  
3. Check the PLC user program and the connection from the switch to the PLC input module, provided the axis has not reached the hardware limit switch at all.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**21616 [Channel %1: ] Block %2 overlaid motion active at transformation switchover**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The overlaid motion in the BCS changes its significance because of the transformation change and can therefore lead to undesired axis movements.

**Reaction:** Local alarm reaction.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Take out the overlaid movement.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**21617 [Channel %1: ] Block %2 transformation does not allow to traverse the pole**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The preset curve passes through the pole or a forbidden area of the transformation.

**Reaction:** Local alarm reaction.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Modify the part program (if the alarm has occurred in AUTO mode).  
To escape from the alarm position, transformation must be deselected (it is not enough to try a RESET if the transformation remains active when RESET is applied).

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**21618 [Channel %1: ] As from block %2 transformation active: overlaid motion too great**

**Parameters:** %1 = Channel number  
%2 = Block number, label

|                               |                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The share of overlaid motion on the transformation-related axes is so high that the path movement planned by the preparation no longer sufficiently corresponds to the actual ratio for the interpolation. Strategy of singularities, monitoring of working range limitation and dynamic Look Ahead are possibly no longer correct. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | With overlaid motion, keep a sufficiently large path safety distance with regard to poles and working range limitations.                                                                                                                                                                                                            |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                        |

| <b>Explanation:</b>           | The measurement block has ended (the programmed end position of the axis has been reached) but the activated touch probe has not yet responded.<br>Measurement level 2 (MEAWA, MEASA, MEAC)<br>Measured values cannot be converted to the workpiece coordinate system. The measured values of the GEO axes programmed in the measurement task are only available in the machine coordinate system.<br>Causes:<br>Not all GEO axes were programmed in the measurement task. At least one measured value is therefore missing for conversion back into the workpiece coordinate system.<br>Further causes:<br>The measurement tasks programmed for all GEO axes are not identical.<br>When making measurements without handshake, two probes must be available in drive parameters p0680 index 0 and 1. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | Check the traversing movement in the measurement block. <ul style="list-style-type: none"><li>- Is it necessary in all cases for the activated probe to have switched up to the specified axis position?</li><li>- Are the probe, cable, cable distributor, terminal connections in good order?</li><li>- Is the probe correctly wired and configured on the hardware side (e.g. drive parameters p0488 and p0489)?</li></ul> Either program all GEO axes explicitly or program the traversing movement with the POS[axis] command.                                                                                                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### 21800      **[Channel %1: ] Workpiece setpoint %2 reached**

|                    |                                                |
|--------------------|------------------------------------------------|
| <b>Parameters:</b> | %1 = Channel number<br>%2 = Workpiece setpoint |
|--------------------|------------------------------------------------|

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>This alarm is activated via MD27880 \$MC_PART_COUNTER, bit 1: The number of counted workpieces (\$AC_ACTUAL_PARTS or \$AC_SPECIAL_PARTS) is equal or already greater than the programmed value for the number of required workpieces (\$AC_REQUIRED_PARTS). At the same time, the channel VDI signal "Workpiece setpoint reached" is output. The value for the number of counted workpieces (\$AC_ACTUAL_PARTS) is reset, while the value of \$AC_SPECIAL_PARTS is retained.</p> <p>Note:</p> <p>The setpoint/actual comparisons of the workpieces are only made after an NC start under the condition that \$AC_REQUIRED_PARTS &gt; 0. If \$AC_REQUIRED_PARTS has a negative value, all workpiece counts activated through MD27880 \$MC_PART_COUNTER are frozen at the values they have reached, and the nominal/actual comparison is discontinued.</p> |
| <b>Reaction:</b>              | <p>NC not ready.</p> <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | No program interrupt. Delete alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Explanation:</b> | <p>CALCFIR calculation is not possible for FIR filters.</p> <p>Cause:</p> <ol style="list-style-type: none"> <li>1: No jerk filter activated in MD32400 \$MA_AX_JERK_ENABLE.</li> <li>2: No jerk filter of the type FIR parameterized in MD32402 \$MA_AX_JERK_MODE for the filter chain selected with MD32404 \$MA_CALCFIR_SELECT.</li> <li>3: No jerk filter of the type FIR with Hamming window parametrized in MD32409 \$MA_AX_JERK_FIR_WINDOW for the filter chain selected with MD32404 \$MA_CALCFIR_SELECT.</li> <li>4: MD32404 \$MA_CALCFIR_SELECT does not affect the same filter chain or the same mode in the channel axes.</li> <li>5: MD32405 \$MA_CALCFIR_FREQ does not lie within the range of 10 to 100 Hz for a dynamic mode.</li> <li>6: MD32431 \$MAX_AX_JERK does not lie within the range of 5 to 500 m/s<sup>3</sup> (or 1.8 bis 180 1/s<sup>3</sup> for rotary axes in Advanced Mode) for a dynamic mode.</li> <li>7: Values cannot be calculated</li> <li>8: Adjustment of filter delay time not possible because the phase filter in MD32890 \$MA_DESVAL_DELAY_ENABLE is not activated.</li> <li>9: Adjustment of filter amplitude not possible because t CALCFIR settings differ too much.</li> </ol> |
| <b>Reaction:</b>    | <p>Alarm display.</p> <p>Interface signals are set.</p> <p>Interpreter stop</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>      | <p>Remedies for causes:</p> <ol style="list-style-type: none"> <li>1: Activate jerk filter: MD32400 \$MA_AX_JERK_ENABLE = TRUE</li> <li>2: Select FIR low pass type 5 in MD32402 \$MA_AX_JERK_MODE</li> <li>3: Select Hamming window: MD32409 \$MA_AX_JERK_FIR_WINDOW = 1</li> <li>4: Select identical filter chain in all channel axes, see MD32404 \$MA_CALCFIR_SELECT</li> <li>5: Select MD32405 \$MA_CALCFIR_FREQ in the permissible range from 10 to 100 Hz, or deactivate CALCFIR calculation (MD32405 \$MA_CALCFIR_FREQ = 0 Hz)</li> <li>6: Select MD32431 \$MA_MAX_AX_JERK in the permissible range from 5 to 500 m/s<sup>3</sup> (or 1.8 to 180 1/s<sup>3</sup> for rotary axes in Advanced Mode) or deactivate CALCFIR calculation (MD32405 \$MA_CALCFIR_FREQ = 0 Hz)</li> <li>7: Please inform the authorized personnel/service department</li> <li>8: Activate phase filter: MD32890 \$MA_DESVAL_DELAY_ENABLE = TRUE</li> <li>9: Decrease MD32405 \$MA_CALCFIR_FREQ or increase MD32406 \$MA_CALCFIR_TOL.</li> </ol>                                                                                                                                                                                               |

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

## 22000 [Channel %1: ] Block %2 Spindle %3 Gear stage change in %4 not possible

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Spindle number  
%4 = Gear stage

**Explanation:** A gear stage change for the spindle will not be possible, if:  
- thread cutting (G33, G34, G35) is active  
- the spindle is active as master or slave spindle in a coupling  
- the spindle is being positioned

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** The gear stage is to be set prior to the corresponding machining step.  
If it is necessary, however, to change the gear stage within one of the above mentioned functions, this function must be switched off for the time of the gear stage change. Thread cutting is deselected with G1; synchronous spindle coupling is switched off with COUPOF; the spindle positioning operation is exited with M3, M4 or M5.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

## 22001 [Channel %1: ] Block %2 Axis %3: Braking time %6 [s] longer than Stop D time. Reason: %5.

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis name  
%4 = Reason | Braking time[s]

**Explanation:** The current axis dynamic response and/or parameterized Stop D time are not sufficient to come to a standstill on time when a Stop D is triggered.

Note:

Parameter 4 contains the descriptions of parameters 5 and 6 separated by the "|" character.

Parameter 5 = Reason, possible values:

- 1: MD32300 \$MA\_MAX\_AX\_ACCEL too low.
- 2: MD32431 \$MA\_MAX\_AX\_JERK too low.
- 3: Excessive acceleration reduction activated with ACC or subsequent to FXST.
- 4: Excessive jerk reduction programmed with JERKLIMA.

Parameter 6 = Braking time [s]

The displayed time is the expected braking time determined for the current type of movement or the dynamic response setting of the axis.

**Reaction:** Alarm display.

**Remedy:** For 'NC-based' SI monitoring:  
Increase MD36953 \$MA\_SAFE\_STOP\_SWITCH\_TIME\_D.  
For 'drive-based' SI monitoring:  
Increase Stop D time in the drive (p9553).  
Increase MD32300 \$MA\_MAX\_AX\_ACCEL and MD32431 \$MA\_MAX\_AX\_JERK.  
Increase programmed acceleration (ACC) or jerk (JERKLIMA).  
Correct torque and acceleration reduction subsequently to FXST.  
Alarm can be suppressed with MD11415 \$MN\_SUPPRESS\_ALARM\_MASK\_2 bit 13.

**Programm continuation:** Clear alarm with the Delete key or NC START.

| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Correct the PLC program.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>22011</b>                  | <b>[Channel %1: ] Block %3 spindle %2 change to programmed gear stage not possible</b>                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Spindle number<br>%3 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Explanation:</b>           | With the 'DryRun', 'ProgramTest' and 'SearchRunByProgTest' functions deselected, it is not possible in the REPOS module to carry out a gear stage change to a previously programmed gear stage. This is the case, if the spindle is in the deselection block not active in speed control mode, as a slave axis or in a transformation. Execution of a gear stage change is avoided if the above mentioned functions are deselected by resetting bit 2 of MD35035 \$MA_SPIND_FUNCTION_MASK. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | Change deselection block or block search target block to speed control mode (M3, M4, M5, SBCOF). Set bit 2 of MD35035 \$MA_SPIND_FUNCTION_MASK to 0.                                                                                                                                                                                                                                                                                                                                       |

**22015 [Channel %1: ] Block %2 following spindle %3 No dynamic response for supplementary motion**

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label<br>%3 = Number of following spindle                                                                                                                                                                                                                                                                                                                                   |
| <b>Explanation:</b> | The differential motion of the following spindle cannot be executed due to a lack of available velocity. The coupling consumes the entire available dynamic response. The following spindle is already rotating at maximum speed. In the part program a deadlock might occur. The alarm can be suppressed with MD11410 \$MN_SUPPRESS_ALARM_MASK bit 26 = 1 or with CP programming by setting CPMALARM[Fax] bit 6 = 1. |
| <b>Reaction:</b>    | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>      | Reduce the speed of the master spindle                                                                                                                                                                                                                                                                                                                                                                                |

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**22016 [Channel %1: ] Block %2 following spindle %3 in the range of reduced acceleration capability**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Number of following spindle

**Explanation:** The following spindle is driven with position control. Additional motion components of the following spindle should not leave the linear range of the motor used. If they do, deviations may occur in the contour and servo alarms could even be output. Monitoring is based on the configuration in MD35220 \$MA\_ACCEL\_REDUCTION\_SPEED\_POINT. If the situation is being managed by the user, the alarm can be suppressed with MD11410 \$MN\_SUPPRESS\_ALARM\_MASK bit 25 = 1 or with CP programming by setting CPMALARM[FAx] bit 7 = 1.

**Reaction:** Alarm display.

**Remedy:** Use coupling type VV and safeguard SPCOF for master and following spindle.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**22018 [Channel %1: ] Block %2 following axis/spindle %3 time monitoring: 'Synchronism fine' not reached**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Following axis/spindle number

**Explanation:** After reaching the setpoint-side synchronism, the time until reaching the actual value-side synchronism is fine monitored. The tolerance is not reached within the time window defined in MD37240 \$MA\_COUP\_SYNC\_DELAY\_TIME[0]:  
 MD37210 \$MA\_COUPLE\_POS\_TOL\_FINE and MD37230 \$MA\_COUPLE\_VELO\_TOL\_FINE

**Reaction:** Alarm display.

**Remedy:** Please inform the authorized personnel/service department.  
 The interrelation between MD37240 \$MA\_COUP\_SYNC\_DELAY\_TIME[0] and MD37210 \$MA\_COUPLE\_POS\_TOL\_FINE or MD37230 \$MA\_COUPLE\_VELO\_TOL\_FINE must be adapted to the mechanical conditions.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**22019 [Channel %1: ] Block %2 following axis/spindle %3 time monitoring: 'Synchronism coarse' not reached**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = Following axis/spindle number

**Explanation:** After reaching the setpoint-side synchronism, the time until reaching the actual value-side synchronism is coarsely monitored.  
 The tolerance is not reached within the time window defined in MD37240 \$MA\_COUP\_SYNC\_DELAY\_TIME[1]:  
 MD37200 \$MA\_COUPLE\_POS\_TOL\_COARSE or MD37220 \$MA\_COUPLE\_VELO\_TOL\_COARSE

**Reaction:** Alarm display.

**Remedy:** Please inform the authorized personnel/service department.  
 The interrelation between MD37240 \$MA\_COUP\_SYNC\_DELAY\_TIME[1] and MD37200 \$MA\_COUPLE\_POS\_TOL\_COARSE or MD37220 \$MA\_COUPLE\_VELO\_TOL\_COARSE must be adapted to the mechanical conditions.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**22020 [Channel %1: ] Block %3 spindle %2 gear step change position not reached**

**Parameters:** %1 = Channel number  
 %2 = Spindle number  
 %3 = Block number, label

|                               |                                                                                                                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | Through the configuration of MD35010 \$MA_GEAR_STEP_CHANGE_ENABLE[AXn] = 2, the spindle is traversed to the position stored in MD35012 \$MA_GEAR_STEP_CHANGE_POSITION[AXn] before the actual gear step change. The required gear step change position has not been reached. |
| <b>Reaction:</b>              | Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                |
| <b>Remedy:</b>                | Correct sequence in the PLC.                                                                                                                                                                                                                                                |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                        |

---

**22022 [Channel %1: ] Block %2 spindle %3 gear stage %4 is expected for axis mode.**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Spindle<br>%4 = Gear stage                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Explanation:</b>           | The gear stage required for axis mode has not been installed.<br>A gear stage has been configured in MD35014 \$MA_GEAR_STEP_USED_IN_AXISMODE, in which the spindle is to be in axis mode. This gear stage is checked whenever the spindle is switched into axis mode. The configured gear stage is compared with the gear stage output by the PLC (NC/PLC interface signal DB380x DBX2000.0 - .2 (Actual gear stage A through C)). This alarm will be output if the gear stages are not the same. |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Remedy:</b>                | Program M70 before the switch to axis mode. The gear stage configured in MD35014 \$MA_GEAR_STEP_USED_IN_AXISMODE is then automatically loaded.<br>No gear stage change is required if the configured gear stage is already active. M40 remains active beyond the gear stage change.<br>Consider MD20094 \$MC_SPIND_RIGID_TAPPING_M_NR.                                                                                                                                                            |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

---

**22024 [Channel %1: ] Block %2 Spindle %3 tapping: PLC signal 'invert M3/M4' changed after %4**

|                               |                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Spindle<br>%4 = Value                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | When loading a G331 block it was detected that the NC/PLC interface signal DB380x DBX2001.6 (invert M3/M4) had changed during part program execution. An alarm was output to prevent a tool break. The current value of the NC/PLC interface signal is displayed as parameter 4.                                                                                                    |
| <b>Reaction:</b>              | Channel not ready.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | A change in the NC/PLC interface signal DB380x DBX2001.6 (invert M3/M4) during part program execution should be avoided.<br>If MD35035 SPIND_FUNCTION_MASK bit 22 is set, the NC/PLC interface signal DB380x DBX2001.6 (invert M3/M4) is then no longer evaluated during tapping with G331, G332. The alarm is no longer output. Notice! Setting bit 22 means a change in function. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                |

|                               |                                                                                                                                                                         |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>22038</b>                  | <b>[Channel %1: ] Block %2 Axis/Spindle %3 'Delete synchronism override' is being ignored</b>                                                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Axis/spindle number                                                                                             |
| <b>Explanation:</b>           | VDI interface signal DB31...,DBX31.7 'Correct synchronism' is being ignored, because VDI interface signal DB31...,DBX31.6 'Delete synchronism override' has been set.   |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                          |
| <b>Remedy:</b>                | Reset the two VDI interface signals DB31...,DBX31.6 'Correct synchronism' and DB31...,DBX31.7 'Delete synchronism override', before the latter signal can be set again. |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                            |

---

| <hr/>                         |                                                                                                                                                                                                                                                                                                                                    |
| <b>22051</b>                  | <b>[Channel %1: ] Block %3 spindle %2 reference mark not found</b>                                                                                                                                                                                                                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number<br>%3 = Block number, label                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | When referencing, the spindle turned through a greater distance than given in the axis-specific MD34060 \$MA_REFP_MAX_MARKER_DIST, without receiving a reference mark signal. The check is performed for spindle positioning with SPOS or SPOSA when the spindle has not previously run with speed control (S=...).                |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Check and correct the MD34060 \$MA_REFP_MAX_MARKER_DIST. The value entered states the distance in [mm] or [degrees] between 2 zero markers.                                                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                               |
| <hr/>                         |                                                                                                                                                                                                                                                                                                                                    |
| <b>22052</b>                  | <b>[Channel %1: ] Block %3 spindle %2 no standstill on block change</b>                                                                                                                                                                                                                                                            |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number<br>%3 = Block number, label                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | The displayed spindle has been programmed as spindle or as axis even though a positioning operation is still running from the previous block (with SPOSA ... spindle positioning beyond block limits).<br>Example:<br>N100 SPOSA [2] = 100<br>:<br>N125 S2 = 1000 M2 = 04 ; Error, if spindle S2 from block N100 is still running! |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                             |

|                               |                                                                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remedy:</b>                | Before programming the spindle/axis again using the SPOSA instruction, a WAITS command should be activated in order to wait for the programmed spindle position.<br>Example:<br>N100 SPOSA [2] = 100<br>:<br>N125 WAITS (2)<br>N126 S2 = 1000 M2 = 04 |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                  |

---

|                               |                                                                                                                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>22053</b>                  | <b>[Channel %1: ] Block %3 spindle %2 reference mode not supported</b>                                                                                                                        |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number<br>%3 = Block number, label                                                                                                             |
| <b>Explanation:</b>           | In the case of SPOS/SPOSA with an absolute encoder, only the referencing mode MD34200 \$MA_ENC_REFP_MODE = 2 is supported! SPOS/SPOSA does not support MD34200 \$MA_ENC_REFP_MODE = 6 at all! |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                        |
| <b>Remedy:</b>                | Change the setting of MD34200 \$MA_ENC_REFP_MODE or change to JOG+REF and then reference.                                                                                                     |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                          |

---

|                               |                                                                                                                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>22055</b>                  | <b>[Channel %1: ] Block %3 spindle %2 configured positioning speed is too high</b>                                                                                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number<br>%3 = Block number, label                                                                                                                                  |
| <b>Explanation:</b>           | The current position is not referenced with the measuring system position although reference is made to it.                                                                                                        |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                     |
| <b>Remedy:</b>                | Correct the NC part program. Create the zero mark synchronization by positioning, by rotation (at least 1 revolution) in speed control mode or with the G74 command before enabling the alarm-generating function. |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                       |

---

%3 = String (identifier)

**Explanation:** The specified tool group does not contain a replacement tool which is ready for use and could be used for tool change. It is possible that all the tools in question have been set to the 'Disabled' state by the tool monitoring function. The alarm can occur for example in conjunction with alarm 14710 (error on INIT block generation). In this case the NCK attempts, e.g., to replace the disabled tool located on the spindle with an available replacement tool, which however does not exist in this error case.

With this conflict, the user must, for example, remove the tool located on the spindle by issuing a spindle movement command (e.g. using an HMI operation).

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:**

- Ensure that the specified tool group contains a tool that is ready for use when the tool change is requested.
- Replace, for example, disabled tools or enable a disabled tool manually.
- If an alarm occurs on programming TCA, check whether the duplo number been programmed >0?
- Check whether the tool data are correctly defined. Have all intended tools in the group been defined with the specified identifier or loaded?

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**22069 [Channel %1: ] Block %2 tool management: No tool available in tool group %3, program %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = String (identifier)  
%4 = Program name

**Explanation:** The specified tool group does not contain a tool which is ready for use and could be used for tool change. It is possible that all of the tools in question have been set to the 'Disabled' state by the tool monitoring function. Parameter %4 = program name facilitates the identification of the program containing the programming command (tool selection) that caused the error. This can be a subprogram or cycle, etc., which can no longer be identified from the display. If the parameter is not specified, it is the currently displayed program.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:**

- Ensure that the specified tool group contains a tool that is ready for use when tool change is requested.
- This can be achieved, for example, by replacing disabled tools, or
- by releasing a disabled tool manually.
- Check whether the tool data are correctly defined. Have all intended tools in the group been defined with the specified identifier and loaded?

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**22070 [TO unit %1: ] Please change tool %2 into magazine. Repeat data backup**

**Parameters:** %1 = TO unit  
%2 = T number of tool

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>The alarm can only occur when the tool management function is active in the NCK. (TOOLMAN = tool management) A data backup of the tool/magazine data has been started. During the backup, the system detected that tools are still located in the buffer magazine (= spindle, gripper, ...). During the backup, these tools will lose the information which defines the magazine and location to which they are allocated.</p> <p>It is therefore practical -assuming that the data are to be stored exactly as before - to ensure that all tools have been deposited in the magazine before the data backup!</p> <p>If this is not the case, some magazine locations will have the "reserved" status when the data are loaded again. This "reserved" status must then be reset manually.</p> <p>For tools with fixed location coding, the loss of the information allocating their location in the magazine has the same effect as a general empty location search when they are returned to the magazine.</p> |
| <b>Reaction:</b>              | <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Remedy:</b>                | Ensure that there are no tools in the buffer magazine before making the data backup. Repeat the data backup after removing the tools from the buffer magazine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Explanation:</b>           | <p>The alarm can only occur when the tool management function is active in the NCK. Either the language command SETTA has been programmed or the corresponding operator action has been carried out via HMI, PLC, .... The alarm can also be triggered automatically by the NCK in the wear grouping function. It is detected that more than one tool from the tool group (tools with the same name/identifier) has the status "active".</p> <p>The specified tool is either</p> <ul style="list-style-type: none"> <li>from a non-considered magazine,</li> <li>from a non-considered wear grouping,</li> <li>or from a non-active wear grouping</li> </ul> <p>in a buffer location (is neither magazine nor wear grouping).</p>                                                                                                                                                |
| <b>Reaction:</b>              | <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Remedy:</b>                | <p>The alarm is intended for information purposes. If only one tool in a group can be active at a time for technological reasons or for reasons of display, the "active" status must be canceled for the tool causing the error.</p> <p>Otherwise, the alarm can be ignored or even suppressed via the MD11410 \$MN_SUPPRESS_ALARM_MASK.</p> <p>Typical reasons of display are present, if the operator works with the function 'definite D numbers', which can be displayed on Siemens HMI in a definite form only, if exactly one tool from a tool group has the status 'active'.</p> <p>Before machining can be started or before the SETTA (or corresponding HMI operation, ...) language command is used, all tools of the magazine should have the status "not active".</p> <p>One option to achieve this is programming SETTIA (or corresponding HMI operation, ...).</p> |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

---

**22200 [Channel %1: ] Block %3 Spindle %2 axis stopped during tapping**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number<br>%3 = Block number, label                                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | When tapping with compensating chuck (G63) the drilling axis was stopped via the NC/PLC interface and the spindle continues to rotate. The thread and possibly also the tap were damaged as a result.                                                                                                                                                                                                   |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Provide an interlock in the PLC user program so that no axis stop can be initiated when tapping is active. If the tapping operation is to be terminated under critical machine conditions, the spindle and the axis should be stopped simultaneously if at all possible. Slight differences are then accommodated by the compensating chuck. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                    |

|                     |                                                                                                                                                                                                                                                         |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>22275</b>        | <b>[Channel %1: ] Block %2 zero velocity of thread axis at position %3 reached</b>                                                                                                                                                                      |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label<br>%3 = Position                                                                                                                                                                                        |
| <b>Explanation:</b> | An axis standstill was reached at the specified position during thread cutting with G35 due to the linear decrease in the thread pitch. The standstill position of the thread axis depends on:<br>- Programmed thread pitch decrease<br>- Thread length |
| <b>Reaction:</b>    | Alarm display.                                                                                                                                                                                                                                          |
| <b>Remedy:</b>      | Change at least one of the above factors.                                                                                                                                                                                                               |

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**22280 [Channel %1: ] In block %2: Prog. acceleration path too short %3, %4 required**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Prog. acceleration path  
%4 = Required acceleration path

**Explanation:** In order to stay within the programmed acceleration path, the acceleration caused an overload on the thread axis. In order to accelerate the axis with the programmed dynamic response, the length of the acceleration path must be at least as large as the value in parameter %4.

The alarm is of the technological type and is output whenever bit 2 in MD11411 \$MN\_ENABLE\_ALARM\_MASK is enabled. The HMI softkey 'Technology support' sets and clears this bit in the MD.

**Reaction:** Alarm display.

**Remedy:** Modify part program or reset MD11411 \$MN\_ENABLE\_ALARM\_MASK bit 2.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**22282 [Channel %1: ] In block %2: Prog. thread block too short to comply with the dynamic limit values %3, %4 is required**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Smoothing length that can be taken from the programmed thread block  
%4 = Smoothing length required for dynamic response adjustment with compliance with the limit values

**Explanation:** If programming requires a dynamic response adjustment from one thread element to the next thread element, a check is made to see if the path length is long enough to comply with the dynamic limit values. Only a part of the programmed path length can be taken for this smoothing because the programmed target speed of the thread block for the required thread geometry (thread pitch, spindle speed) has to be reached and output. The dynamic limit values are exceeded for the dynamic response adjustment to the required thread geometry.

The alarm is only output if it is not suppressed by bit 25 of MD11415 \$MN\_SUPPRESS\_ALARM\_MASK\_2.

**Reaction:** Alarm display.

**Remedy:** 1. Change part program and lengthen the path of thread block %2 or the next block.  
There is a danger of collision as a result of path lengthening, especially for female threads. This must be checked.  
2. Lengthen the smoothing length of the thread block with DITRB = -1.  
3. Set MD11415 \$MN\_SUPPRESS\_ALARM\_MASK\_2 bit 25.  
4. Set setting data SD42010 \$SC\_THREAD\_RAMP\_DISP[2] = 0.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**22290 [Channel %1: ] Spindle operation for transformed spindle/axis %2 not possible (reason: error code %3).**

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number  
%3 = Error code

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | It is not possible to change over the operating mode of the axis/spindle.<br>Cause:<br>1: The required axis/spindle is not known in the channel.<br>2: The required axis/spindle is not available in the channel.<br>3: The required axis/spindle is defined as virtual axis.<br>4: The required axis is not defined as spindle. Therefore, it is not possible to change over the operating mode of the axis.<br>5: The required axis/spindle is a permanently assigned PLC axis/spindle.<br>6: The required axis/spindle is an active slave axis/spindle.<br>7: Spindle operation is not possible for transformed spindle/axis.<br>8: The required axis/spindle is not available as command axis. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Remedy:</b>                | 1: Please select the PI service again.<br>2: Please select the PI service again.<br>3: Reset MD 30132 IS_VIRTUAL_AX.<br>4: When required, configure axis as spindle.<br>5: Axis/spindle enabled by the PLC.<br>6: Deactivate coupling of the slave axis/spindle.<br>7: Deactivate transformation.<br>8: Wait until the axis is again available.                                                                                                                                                                                                                                                                                                                                                    |

**22296 [Channel %1: ] Spindle %2 Error on gear stage change (cause: error code %3)**

**Parameters:** %1 = Channel number  
 %2 = Axis name, spindle number  
 %3 = Error code

**Explanation:** An error occurred during gear stage change. The cause is specified by the error code.

Error codes:

- Error code 1 : internal use
- Error code 2 : internal use
- Error code 3 : internal use
- Error code 4 : internal use
- Error code 5 : Switchover to command axis not possible
- Error code 6 : Switchover to PLC axis not possible
- Error code 20 : internal use
- Error code 21 : internal use
- Error code 22 : internal use
- Error code 23 : MD 30132 IS\_VIRTUAL\_AX has been set
- Error code 50 : internal use
- Error code 51 : internal use
- Error code 70 : internal use

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Remedy conflict.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**22297 [Channel %1: ] Spindle %2 FC18 function not possible (cause: error code %3)**

**Parameters:** %1 = Channel number  
 %2 = Axis name, spindle number  
 %3 = Error code

**Explanation:** The function request by PLC via FC18 interface could not be executed. The cause is specified by the error code.

Error codes:

- Error code 1 : internal use
- Error code 2 : internal use
- Error code 3 : internal use
- Error code 4 : internal use
- Error code 5 : Switchover to command axis not possible
- Error code 6 : Switchover to PLC axis not possible
- Error code 20 : internal use
- Error code 21 : internal use
- Error code 22 : internal use
- Error code 23 : MD 30132 IS\_VIRTUAL\_AX has been set
- Error code 50 : internal use
- Error code 51 : internal use
- Error code 70 : internal use

**Reaction:** NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Remedy conflict.

**Programm continuation:** Clear alarm with the Delete key or NC START.

| <b>Explanation:</b>           | <p>For PROFIdrive:</p> <p>The position encoder pulses between 2 zero mark pulses are counted, and the plausibility is assessed (The functionality and possibly the parameterization of the plausibility check is done on the drive side. Please refer to the relevant drive documentation for details.), and reported in a PROFIdrive message frame (encoder interface) to the control, which then issues the present alarm.</p> <p>The alarm can be reprogrammed in MD11412 \$MN_ALARM_REACTION_CHAN_NOREADY (channel not ready).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Reaction:</b>              | <p>Mode group not ready.</p> <p>The NC switches to follow-up mode.</p> <p>Channel not ready.</p> <p>NC Start disable in this channel.</p> <p>Axes of this channel must be re-referenced.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm.</p> <p>Channel not ready.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | <p>Please inform the authorized personnel/service department.</p> <p>The differences can result from transmission errors, disturbances, encoder hardware faults or from the evaluation electronics in the encoder used for position control. The actual value branch must therefore be checked:</p> <ol style="list-style-type: none"> <li>1. Transmission path: Check the actual-value connectors for correct contacting, encoder cable for continuity, and also check for short-circuits and grounding (loose contact?).</li> <li>2. Encoder pulses: Is the encoder power supply within the tolerance limits?</li> <li>3. Evaluation electronics: Replace or reconfigure the drive or encoder module used.</li> <li>4. Check MD34220 \$MA_ENC_ABS_TURNS_MODULO and Sinamics drive parameter P0979 subindex 5 (or 15,25). They have to be the same for correct handling of the encoder data.</li> </ol> <p>Monitoring can be switched off by setting MD36310 \$MA_ENC_ZERO_MONITORING [n] to 0 or 100 (n = encoder number: 1, 2).</p> |
| <b>Programm continuation:</b> | Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. The differences can result from transmission errors, disturbances, encoder hardware faults or from the evaluation electronics in the encoder not used for position control. The actual value branch must therefore be checked:<br><ol style="list-style-type: none"><li>1. Transmission path: Check the actual-value connectors for correct contacting, encoder cable for continuity, and also check for short-circuits and grounding (loose contact?).</li><li>2. Encoder pulses: Is the encoder power supply within the tolerance limits?</li><li>3. Evaluation electronics: Replace or reconfigure the drive or encoder module used.</li><li>4. Check MD34220 \$MA_ENC_ABS_TURNS_MODULO and Sinamics drive parameter P0979 subindex 5 (or 15,25). Both have to be the same for correct handling of the encoder data.</li></ol> Monitoring can be switched off by setting MD36310 \$MA_ENC_ZERO_MONITORING[n] to 0 or 100 (n = encoder number: 1, 2). |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**25030      Axis %1 actual velocity alarm limit**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Explanation:</b>           | If the axis has at least one active encoder, then the actual speed of the axis is cyclically checked in the IPO cycle. If there are no errors, the actual velocity can never become greater than specified in the axis-specific MD36200 \$MA_AX_VELO_LIMIT (threshold for velocity monitoring). This threshold value in [mm/min, rev/min] is input by an amount that is about 5 to 10% greater than that which can occur at maximum traversing velocity. Drive errors can result in the velocity being exceeded and the alarm is then triggered.<br><br>The alarm can be reprogrammed in the MD11412 \$MN_ALARM_REACTION_CHAN_NOREADY (channel not ready). |
| <b>Reaction:</b>              | Mode group not ready.<br>The NC switches to follow-up mode.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Channel not ready.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department.<br>- Check the speed setpoint cable (bus cable).<br>- Check the actual values and direction of position control.<br>- Change the position control direction if the axis rotates uncontrollably -> axis-specific MD32110 \$MA_ENC_FEEDBACK_POL [n] = < -1, 0, 1 >.<br>- Increase the monitoring limit value in MD 36200 \$MA_AX_VELO_LIMIT.                                                                                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Restart part program.    Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Parameters:</b>            | %1 = Axis name, spindle number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Explanation:</b>           | <p>The NC monitors to ensure that the position is held at zero speed. Monitoring is started after a time that can be set for a specific axis in the MD36040 \$MA_STANDSTILL_DELAY_TIME after interpolation has ended. A constant check is made to determine whether the axis remains within the tolerance range given in MD36030 \$MA_STANDSTILL_POS_TOL.</p> <p>The following cases are possible:</p> <ol style="list-style-type: none"> <li>1. The NC/PLC interface signal DB380x DBX2.1 (Servo enable) is zero because the axis has jammed mechanically. Due to mechanical influences (e.g. high machining pressure), the axis is pushed outside the permissible position tolerance.</li> <li>2. With closed position control loop (without jamming) - NC/PLC interface signal DB380x DBX2.1 (Servo enable) is "1" - the axis is pushed away from its position by mechanical forces with a small gain in the position control loop.</li> </ol> <p>The alarm can be reprogrammed in the MD11412 \$MN_ALARM_REACTION_CHAN_NOREADY (channel not ready).</p> |
| <b>Reaction:</b>              | <p>Mode group not ready.</p> <p>The NC switches to follow-up mode.</p> <p>Channel not ready.</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm.</p> <p>Channel not ready.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | <p>Please inform the authorized personnel/service department.</p> <ul style="list-style-type: none"> <li>- Check MD36040 \$MA_STANDSTILL_DELAY_TIME and MD36030 \$MA_STANDSTILL_POS_TOL; increase if necessary. The value must be greater than the machine data "Exact stop - coarse" (MD36000 \$MA_STOP_LIMIT_COARSE).</li> <li>- Estimate machining forces and reduce if necessary by setting a lower feed or a higher rotational speed.</li> <li>- Increase clamping pressure.</li> <li>- Increase the gain in the position control loop by improved optimization (Kv factor MD32200 \$MA_POSCTRL_GAIN).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Parameters:</b>            | %1 = Axis name, spindle number                                                                                                                                                                                                                                                                                                                                            |
| <b>Explanation:</b>           | The defined end position was not reached within the time specified in the machine data.                                                                                                                                                                                                                                                                                   |
| <b>Reaction:</b>              | <p>Mode group not ready.</p> <p>The NC switches to follow-up mode.</p> <p>Channel not ready.</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm.</p> <p>Channel not ready.</p>                                                                                                                      |
| <b>Remedy:</b>                | <ul style="list-style-type: none"> <li>- If the drive torque (FXST) was set too low with the result that the force of the motor was not sufficient to reach the end position -&gt; increase FXST.</li> <li>- If the machined part is slowly deformed, there may be a delay in reaching the end position -&gt; increase MD36042 \$MA_FOC_STANDSTILL_DELAY_TIME.</li> </ul> |
| <b>Programm continuation:</b> | Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                                                                                                                                                                                                                                            |

---

**25050      Axis %1 contour monitoring****Parameters:**      %1 = Axis name, spindle number**Explanation:**      The NCK calculates for each interpolation point (setpoint) of an axis the actual value that should result based on an internal model. If this calculated actual value and the true machine actual value differ by a larger amount than given in the MD36400 \$MA\_CONTOUR\_TOL, then the program is canceled and the alarm message is issued.

The alarm can be reprogrammed in the MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY (channel not ready).

**Reaction:**      Mode group not ready.  
The NC switches to follow-up mode.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.  
Channel not ready.**Remedy:**      Please inform the authorized personnel/service department.  
- Check whether the tolerance value set in MD36400 \$MA\_CONTOUR\_TOL is too small.  
- Check optimization of the position controller (Kv factor in the MD32200 \$MA\_POSCTRL\_GAIN) to establish whether the axis follows the given setpoint without overshooting. Otherwise, the speed controller optimization must be improved or the Kv servo gain factor must be reduced.  
- Improvement of speed controller optimization  
- Check the mechanics (smooth running, inertial masses).**Programm continuation:**      Restart part program.    Clear alarm with the RESET key in all channels of this mode group. Restart part program.

---

**25060      Axis %1 speed setpoint limitation****Parameters:**      %1 = Axis name, spindle number**Explanation:**      The speed setpoint has exceeded its upper limit for a longer period than allowed.

The maximum speed setpoint is limited to a certain percentage by the axis-specific MD36210 \$MA\_CTRLOUT\_LIMIT. The input value of 100% corresponds to the rated speed of the motor and hence the rapid traverse velocity.

For SINAMICS: Drive parameter p1082 also has a limiting effect.

If the values are exceeded for a short time, then this is tolerated provided they do not last longer than allowed for in the axis-specific MD36220 \$MA\_CTRLOUT\_LIMIT\_TIME. The setpoint is limited during this time to the maximum value that has been set in (MD36210 \$MA\_CTRLOUT\_LIMIT).

The alarm can be reprogrammed in the MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY (channel not ready).

**Reaction:**      Mode group not ready.  
The NC switches to follow-up mode.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.  
Channel not ready.**Remedy:**      Please inform the authorized personnel/service department. This alarm should not occur if the drive controller has been set correctly and the machining conditions are those that normally prevail.  
- Check actual values: Local sluggishness of the carriage, speed dip by torque surge due to contact with workpiece/tool, travel against fixed obstacle, etc.  
- Check direction of position control: Does the axis continue to rotate without control?**Programm continuation:**      Restart part program.    Clear alarm with the RESET key in all channels of this mode group. Restart part program.

---

**25070      Axis %1 drift value too large****Parameters:**      %1 = Axis name, spindle number

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | <p>Only with analog drives!</p> <p>The permissible maximum value of drift (internal, integrated drift value of automatic drift compensation) was exceeded during the last compensation operation. The permissible maximum value is defined in the axis-specific MD36710 \$MA_DRIFT_LIMIT. The drift value itself is not limited.</p> <p>Automatic drift compensation: MD36700 \$MA_DRIFT_ENABLE=1</p> <p>The difference between actual and setpoint position (drift) is checked cyclically in the IPO cycle when the axes are at zero speed. The difference is automatically compensated to zero by slowly integrating an internal drift value.</p> <p>Drift compensation by hand: MD36700 \$MA_DRIFT_ENABLE=0</p> <p>A static offset can be added to the speed setpoint in the MD36720 \$MA_DRIFT_VALUE. This is not included in the drift monitoring because it acts like a voltage work offset.</p> |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Adjust the drift compensation with the automatic drift compensation switched off at the drive until the position lag is approximately zero. Then reactivate the automatic drift compensation in order to balance out the dynamic drift changes (effects of heating up).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Parameters:</b>  | %1 = Axis name, spindle number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Explanation:</b> | <p>The prerequisites are not satisfied for the required encoder switchover:</p> <ol style="list-style-type: none"> <li>1. The newly selected encoder must be in the active state: (DB380x DBX1.5 / 1.6 = 1 (Position measuring system 1/2).</li> <li>2. The actual value difference between the two encoders is greater than the value in the axis-specific MD36500 \$MA_ENC_CHANGE_TOL ("Maximum tolerance for actual position value switchover").</li> </ol> <p>Activation of the measuring system concerned takes place in accordance with the NC/PLC interface signals DB380x DBX1.5 (Position measuring system 1) and DB380x DBX1.6 (Position measuring system 2), i.e. the position control is now operated with this measuring system. The other measuring system is switched over to follow-up mode. If both interface signals are set to "1", then only the 1st measuring system is active; if both interface signals are set to "0", the axis is parked.</p> <p>Changeover takes place as soon as the interface signals have changed, even if the axis is in motion.</p> |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. When referencing the active actual position value encoder, the actual value system of the inactive encoder is set to the same reference point value as soon as phase 3 has been concluded. A later positional difference between the two actual value systems can have occurred only as the result of an encoder defect or a mechanical displacement between the encoders. <ul style="list-style-type: none"><li>- Check the encoder signals, actual value cable, connectors.</li><li>- Check the mechanical fastenings (displacement of the measuring head, mechanical twisting possible).</li><li>- Increase the axis-specific MD 36500 \$MA_ENC_CHANGE_TOL.</li></ul> Program continuation is not possible. The program must be canceled with "RESET", then program execution can be reinitiated with NC START, if necessary at the interruption point after "Block search with/without calculation". |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**25105 Axis %1 measuring systems differ considerably**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Explanation:</b>           | The two measuring systems differ considerably, i.e. the cyclically monitored actual value difference between the two measuring systems is greater than the associated tolerance value set in the machine data MD36510 \$MA_ENC_DIFF_TOL. This can only occur when both measuring systems are active (MD30200 \$MA_NUM_ENCS = 2) and referenced. The alarm can be reprogrammed in the MD11412 \$MN_ALARM_REACTION_CHAN_NOREADY (channel not ready). |
| <b>Reaction:</b>              | Mode group not ready.<br>The NC switches to follow-up mode.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Channel not ready.                                                                                                                                                                                                                                  |
| <b>Remedy:</b>                | Inform the authorized personnel/service department.<br>Check the machine data for active and selected encoders.<br>Check the machine data for the tolerance of the encoders (MD36510 \$MA_ENC_DIFF_TOL).                                                                                                                                                                                                                                           |
| <b>Programm continuation:</b> | Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                                                                                                                                                                                                                                                                                                                     |

## 25202 Axis %1 waiting for drive

|                               |                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number                                                                                                                                                                                                                                                                                                                                                              |
| <b>Explanation:</b>           | Drive group error (self-clearing).                                                                                                                                                                                                                                                                                                                                                          |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b>                | For PROFIdrive only:<br><br>Wait for the drive. This alarm reveals similar problems to alarm 25201 (see that alarm). It is continuously active during power-up if the drive does not communicate (e.g. if the PROFIBUS connector has fallen out). Otherwise, the alarm is active only briefly and is replaced by alarm 25201 after an internal timeout in the event of a permanent problem. |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                                                                                                                                                                      |

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Explanation:</b>           | <p>1. Rotary measuring system (MD31000 \$MA_ENC_IS_LINEAR[]==FALSE)</p> <p>The number of encoder marks set in MD31020 \$MA_ENC_RESOL[] does not correspond to the value in the drive machine data (PROFIdrive: p979) or one of the two values is zero.</p> <p>2. Absolute measuring system with EnDat interface (MD30240 \$MA_ENC_TYPE[]==4)</p> <p>On absolute encoders, the resolution of the incremental and absolute tracks supplied by the drive is also checked for consistency.</p> <p>For PROFIdrive drives:</p> <p>Compare drive parameter p979 (and possibly other internal drive, manufacture-specific parameters stated in the relevant drive documentation) or compare images in NC-MDs \$MA_ENC_RESOL, \$MA_ENC_PULSE_MULT, \$MA_ENC_ABS_TURNS_MODULO etc.</p> <p>Conditions leading to triggering the alarm are:</p> <ul style="list-style-type: none"> <li>* Number of encoder pulses in the drive!= \$MA_ENC_RESOL</li> <li>* PROFIdrive interface standardization/high resolution in p979 not permitted (permitted pushing factor 0...30 bits)</li> <li>* With absolute encoders: Interface formats in p979 for absolute and incremental information does not fit together (i.e. the absolute position in XIST2 is supplied in too coarse resolution for a complete position reconstruction)</li> <li>* In the case of rotary absolute encoders behind the gears (and active traversing range extension in accordance with \$MA_ENC_ABS_BUFFERING): Absolute position format (in Gx_XIST2) is not complete/sufficient for position reconstruction via PowerOff in accordance with the following condition: <math>\\$MA\_ENC\_RESOL * \\$MA\_ENC\_PULSE\_MULT * \\$MA\_ENC\_ABS\_TURNS\_MODULO</math> must not be smaller than <math>2^{**32}</math>. A remedy against alarm triggering in the latter case may be to increase \$MA_ENC_PULSE_MULT (or the associated drive-side parameterization e.g. p418/419 with SINAMICS) or (when the necessary conditions prevail) by deactivating the traversing range extension - see \$MA_ENC_ABS_BUFFERING</li> </ul> |
| <b>Reaction:</b>              | <p>Mode group not ready.</p> <p>The NC switches to follow-up mode.</p> <p>Channel not ready.</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm.</p> <p>Channel not ready.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | <p>Please inform the authorized personnel/service department.</p> <p>Adjust machine data.</p> <p>For absolute encoders, possibly pending drive alarms indicating encoder problems should be evaluated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

---

**26003      Axis %1 parameterization error: lead screw pitch****Parameters:**      %1 = Axis name, spindle number**Explanation:**      The pitch of the ballscrew/trapezoidal leadscrew set in the axis-specific MD31030 \$MA\_LEADSCREW\_PITCH is zero.  
The alarm can be reprogrammed in the MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY (channel not ready).**Reaction:**      Mode group not ready.  
The NC switches to follow-up mode.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.  
Channel not ready.**Remedy:**      Determine the leadscrew pitch (specify the machine manufacturer or pitch measurement with spindle cover removed) and enter it in the MD31030: \$MA\_LEADSCREW\_PITCH (mostly 10 or 5 mm/rev.).**Programm continuation:**      Switch control OFF - ON.

---

**26004      Axis %1 encoder %2 parameterization error: grid point distance with linear encoders****Parameters:**      %1 = Axis name, spindle number  
                         %2 = Encoder number**Explanation:**      The scale division of the linear scale set in the axis-specific MD31010 \$MA\_ENC\_GRID\_POINT\_DIST is zero or differs from the corresponding drive parameters. For a better understanding of the interrelations see the explanations for alarm 26002, which refer to rotatory encoders.  
The alarm can be reprogrammed in the MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY (channel not ready).**Reaction:**      Mode group not ready.  
The NC switches to follow-up mode.  
Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.  
Channel not ready.**Remedy:**      Please inform the authorized personnel/service department.  
Enter the encoder grid point distance according to the data given by the machine (or measuring device) manufacturer in the MD31010 \$MA\_ENC\_GRID\_POINT\_DIST.**Programm continuation:**      Switch control OFF - ON.

---

**26005      Axis %1 parameterization error: output rating****Parameters:**      %1 = Axis name, spindle number**Explanation:**      For analog drives:  
The output evaluation of the analog speed setpoint set in the MD32250 \$MA\_RATED\_OUTVAL or in MD 32260 \$MA\_RATED\_VELO is zero.  
The effective output evaluation of the speed setpoint interface is zero:  
a. MD32260 \$MA\_RATED\_VELO is zero although a standardizing reference value needs to be defined on account of the setting MD32250 \$MA\_RATED\_OUTVAL>0  
b. The corresponding drive-side standardizing parameter is zero, invalid or unreadable/unavailable although an automatic interface scaling adjustment has been selected on account of MD32250 \$MA\_RATED\_OUTVAL=0.  
The drive parameter defining the standard is not determined by PROFIdrive, but is specific to the manufacturer (see the relevant drive documentation: For SINAMICS: p2000).  
The alarm can be reprogrammed in the MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY (channel not ready).

|                               |                                                                                                                                                                                                                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Mode group not ready.<br>The NC switches to follow-up mode.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Channel not ready.                                                        |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. The nominal output voltage in [%] of the maximum setpoint value (10 V) is entered in the MD32250 \$MA_RATED_OUTVAL, at which the rated motor speed in [degrees/s] is to be reached (MD32260 \$MA_RATED_VELO). |
| <b>Programm continuation:</b> | Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                                                                                                                                           |

### 26007 Axis %1 QEC: invalid coarse increment

|                               |                                                                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number                                                                                                                                                                                               |
| <b>Explanation:</b>           | The course increment for QEC must be within the range 1 <= course increment <= maximum value of MD18342 \$MN_MM_QEC_MAX_POINTS (currently 1025), because a greater number of values would exceed the available memory space. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                               |
| <b>Remedy:</b>                | Modify the system variable \$AA_QEC_COARSE_STEPS accordingly.                                                                                                                                                                |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                         |

---

**26008 Axis %1 QEC: invalid fine increment****Parameters:** %1 = Axis name, spindle number**Explanation:** The fine increment for quadrant error compensation \$AA\_QEC\_FINE\_STEPS must be in the range  $1 \leq \text{fine increment} \leq 16$  because this value has an influence on the computation time of the QEC.**Reaction:** Alarm display.**Remedy:** Modify the system variable \$AA\_QEC\_FINE\_STEPS accordingly.**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26009 Axis %1 QEC: memory overflow****Parameters:** %1 = Axis name, spindle number**Explanation:** The product of the data \$AA\_QEC\_COARSE\_STEPS+1 and \$AA\_QEC\_FINE\_STEPS must not exceed the maximum number of the characteristic curve points (MD38010 \$MA\_MM\_QEC\_MAX\_POINTS). With a direction-dependent characteristic, this criterion applies to  $2 * (\$AA\_QEC\_COARSE\_STEPS+1) * \$AA\_QEC\_FINE\_STEPS!$ **Reaction:** Alarm display.**Remedy:** Please inform the authorized personnel/service department. Either increase MD38010 \$MA\_MM\_QEC\_MAX\_POINTS or reduce \$AA\_QEC\_COARSE\_STEPS and/or \$AA\_QEC\_FINE\_STEPS.**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26010 Axis %1 QEC: invalid acceleration characteristic****Parameters:** %1 = Axis name, spindle number**Explanation:** \$AA\_QEC\_ACCEL\_1/2/3: The acceleration characteristic is divided into three areas. In each area there is a different quantization of the acceleration steps. The defaults should be changed only if compensation is inadequate in these acceleration areas.

The defaults are as follows:

- \$AA\_QEC\_ACCEL\_1 with approx. 2% of maximum acceleration (\$AA\_QEC\_ACCEL\_3),
- \$AA\_QEC\_ACCEL\_2 with approx. 60% of maximum acceleration (\$AA\_QEC\_ACCEL\_3),
- \$AA\_QEC\_ACCEL\_3 with maximum acceleration (MD32300 \$MA\_MAX\_AX\_ACCEL).

**Reaction:** Alarm display.**Remedy:** Please inform the authorized personnel/service department. Enter the values correctly:  
 $0 < \$AA\_QEC\_ACCEL\_1 < \$AA\_QEC\_ACCEL\_2 < \$AA\_QEC\_ACCEL\_3$ .**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26011 Axis %1 QEC: invalid measuring periods****Parameters:** %1 = Axis name, spindle number**Explanation:** \$AA\_QEC\_MEAS\_TIME\_1/2/3: measuring time to determine the error criterion.

The measuring period begins when the criterion for activating the compensation value has been satisfied (the desired velocity changes the sign). The end is defined by the machine data values. In general, different measuring times are required for the three characteristic ranges. The presettings should be changed only if a problem occurs. The three data apply in each case for the three corresponding acceleration ranges.

1. \$AA\_QEC\_MEAS\_TIME\_1 specifies the measuring time (for determining the error criterion) for accelerations in the range between 0 and \$AA\_QEC\_ACCEL\_1.
2. \$AA\_QEC\_MEAS\_TIME\_2 specifies the measuring time in the range from \$AA\_QEC\_ACCEL\_1 to \$AA\_QEC\_ACCEL\_2.
3. \$AA\_QEC\_MEAS\_TIME\_3 specifies the measuring time in the range from \$AA\_QEC\_ACCEL\_2 to \$AA\_QEC\_ACCEL\_3 and beyond.

**Reaction:** Alarm display.**Remedy:** Please inform the authorized personnel/service department. Enter the values correctly:  $0 < \$AA\_QEC\_MEAS\_TIME\_1 < \$AA\_QEC\_MEAS\_TIME\_2 < \$AA\_QEC\_MEAS\_TIME\_3$ .**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26012 Axis %1 QEC: feed forward control not active****Parameters:** %1 = Axis name, spindle number**Explanation:** The error criterion for determining the quadrant error necessitates a correctly set feedforward control.  
The alarm can be reprogrammed in the MD11412 \$MN\_ALARM\_REACTION\_CHAN\_NOREADY (channel not ready).**Reaction:** Mode group not ready.  
Channel not ready.  
NC Start disable in this channel.  
Alarm display.  
Channel not ready.**Remedy:** Switch on feedforward control and set it correctly.**Programm continuation:** Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.

---

**26014 Axis %1 machine data %2 invalid value****Parameters:** %1 = Axis name, spindle number

%2 = String: MD identifier

**Explanation:** Machine data includes a value that is not valid.**Reaction:** NC not ready.  
The NC switches to follow-up mode.  
Mode group not ready, also effective for single axes.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.**Remedy:** Repeat entry with correct value and then Power On.**Programm continuation:** Switch control OFF - ON.

---

**26015 Axis %1 machine data %2[%3] invalid value****Parameters:** %1 = Axis name, spindle number

%2 = String: MD identifier

%3 = Index: MD array index

**Explanation:** Machine data includes a value that is not valid.**Reaction:** NC not ready.  
The NC switches to follow-up mode.  
Mode group not ready, also effective for single axes.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.**Remedy:** Repeat entry with correct value and then Power On.**Programm continuation:** Switch control OFF - ON.

---

**26016 Axis %1 machine data %2 invalid value****Parameters:** %1 = Axis name, spindle number

%2 = String: MD identifier

**Explanation:** Machine data includes a value that is not valid.

| <b>Remedy:</b>                | Inform the authorized personnel/service department.<br>Avoid dual assignment of the setpoint by correcting MD30110 \$MA_CTRLOUT_MODULE_NR. Also check the selected bus type of MD30100 \$MA_CTRLOUT_SEGMENT_NR.                                                                                           |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                  |

---

**26019 Axis %1 encoder %2 measurement not possible with this controller module**

|                    |                                            |
|--------------------|--------------------------------------------|
| <b>Parameters:</b> | %1 = NC axis number<br>%2 = Encoder number |
|--------------------|--------------------------------------------|

|                               |                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | If the MD13100 \$MN_DRIVE_DIAGNOSIS[8] contains a value not equal to zero, then the control has found at least one control module which does not support measuring. Measuring was programmed from the part program for the associated axis.                                                                                                                                                           |
| <b>Reaction:</b>              | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                       |
| <b>Remedy:</b>                | You have the following possibilities of eliminating the error.<br>- Modify the measuring motion so that the axis concerned does not have to travel. Ensure that you do not program this axis in the measuring block. It is no longer possible to query the measured value for this axis.<br>- Replace the control module with one that supports the measurement. See MD13100 \$MN_DRIVE_DIAGNOSIS[8]. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                  |

---

### 26020 Axis %1 encoder %2 hardware fault %3 during encoder initialization

|                               |                                                                                                                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number<br>%2 = Encoder number<br>%3 = Error fine coding                                                                                                                                                                                  |
| <b>Explanation:</b>           | Error during initialization or access of encoder.                                                                                                                                                                                                                |
| <b>Reaction:</b>              | Mode group not ready.<br>The NC switches to follow-up mode.<br>Channel not ready.<br>NC Start disable in this channel.<br>Axes of this channel must be re-referenced.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Channel not ready. |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Rectify hardware error, replace encoder if necessary.                                                                                                                                                 |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                         |

---

### 26022 Axis %1 encoder %2 measurement with simulated encoder not possible

|                               |                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = NC axis number<br>%2 = Encoder number                                                                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | Alarm occurs on the control when a measurement was made without the encoder hardware (simulated encoder).                                                                                                                                                                                                                                                   |
| <b>Reaction:</b>              | Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | - Inform the authorized personnel/service department.<br>- If possible, modify the measuring motion so that the axis concerned does not have to travel; do not program this axis in the MEAS block again. You can no longer query a measured value for this axis.<br>- Ensure that measurement is not made with simulated encoders (MD30240 \$MA_ENC_TYPE). |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                        |

---

### 26024 Axis %1 machine data %2 value changed

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <b>Parameters:</b> | %1 = Axis name, spindle number<br>%2 = String: MD identifier |
|--------------------|--------------------------------------------------------------|

**Explanation:** The machine data contains an invalid value and therefore has been changed by the software.  
**Reaction:** Alarm display.  
**Remedy:** Check the machine data.  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26025 Axis %1 machine data %2[%3] value changed**

**Parameters:** %1 = Axis name, spindle number  
%2 = String: MD identifier  
%3 = Index: MD array index  
**Explanation:** The machine data contains an invalid value. It was therefore changed by the software internally to a valid value.  
**Reaction:** Alarm display.  
**Remedy:** Check the machine data.  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26026 Axis %1 SINAMICS drive parameter P2038 value is not allowed.**

**Parameters:** %1 = Axis name, spindle number  
**Explanation:** For SINAMICS drives only:  
The interface mode, which is set via drive parameter P2038, has not been set to SIMODRIVE 611 universal.  
The alarm can be disabled by MD13070 \$MN\_DRIVE\_FUNCTION\_MASK - bit15.  
However, the following must be noted:  
- The device-specific assignment of the bits in the control and status words may be different.  
- The drive data sets can be created at will, and need not be subdivided into groups of 8. (For details see also SINAMICS Commissioning Manual). So the parameters of motors 2-4 may be incorrectly assigned.  
**Reaction:** NC not ready.  
The NC switches to follow-up mode.  
Mode group not ready, also effective for single axes.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.  
**Remedy:** - Set P2038 = 1 or  
- Set P0922 = 100...199 or  
- Set bit 15 of MD13070 \$MN\_DRIVE\_FUNCTION\_MASK (note the boundary conditions, see above)  
and execute a Power ON in each case.  
**Programm continuation:** Switch control OFF - ON.

---

**26027 Axis %1 Stiffness mode Splines is not available (%2)**

**Parameters:** %1 = Axis name, spindle number  
%2 = Fine ID  
**Explanation:** The Stiffness mode Splines is not available.  
Fine coding:  
Bit 0 - SINAMICS function block is not present (see P0108)  
Bit 1 - \$MN\_DRIVE\_TELEGRAMM\_TYPE, set telegram that supports splines functionality (e.g. telegram 136)  
Bit 2 - Set \$MA\_VELO\_FFW\_WEIGHT = 100%  
Bit 3 - Set \$MA\_FIPO\_TYPE = 2  
Bit 4 - Set \$MA\_FFW\_MODE = 3 or 4  
Bit 5 - Set \$MN\_POSCTRL\_SYSCLOCK\_TIME\_RATIO = 1

|                               |                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | NC not ready.<br>The NC switches to follow-up mode.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm. |
| <b>Remedy:</b>                | Set \$MA_SPLINES_CONTROL_CONFIG=0, or note and implement fine error code.                                                                                                                                              |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                               |

---

### 26028 Machine data %1[%2] value not permissible

|                               |                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = String: MD identifier<br>%2 = Index: MD array index                                                                                                                                                               |
| <b>Explanation:</b>           | Machine data includes a value that is not valid.                                                                                                                                                                       |
| <b>Reaction:</b>              | NC not ready.<br>The NC switches to follow-up mode.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm. |
| <b>Remedy:</b>                | Repeat entry with correct value and then Power On.                                                                                                                                                                     |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                               |

---

### 26029 Machine data %1[%2] value not permissible

|                               |                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = String: MD identifier<br>%2 = Index: MD array index                                                                                                                                                               |
| <b>Explanation:</b>           | Machine data includes a value that is not valid.                                                                                                                                                                       |
| <b>Reaction:</b>              | NC not ready.<br>The NC switches to follow-up mode.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm. |
| <b>Remedy:</b>                | Repeat entry with the correct value.                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                   |

---

### 26030 Axis %1 encoder %2 absolute position lost

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Axis name, spindle number<br>%2 = Encoder number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b> | The absolute position of the absolute encoder has become invalid because <ul style="list-style-type: none"> <li>- on changing parameter block, a changed gear stage ratio was identified between encoder and processing or</li> <li>- the encoder has been replaced (the absolute encoder's serial number was changed, see MD34230 \$MA_ENC_SERIAL_NUMBER, and drive-specific parameters).</li> <li>- of an internal number format limitation in MD34090 \$MA_REFP_MOVE_DIST_CORR. Remedy: reduce MD10210 \$MN_INT_INCR_PER_DEG or MD10200 \$MN_INT_INCR_PER_MM.</li> </ul> |

|                               |                                                                                                                                                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Mode group not ready.<br>The NC switches to follow-up mode.<br>Channel not ready.<br>NC Start disable in this channel.<br>Axes of this channel must be re-referenced.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.<br>Channel not ready. |
| <b>Remedy:</b>                | Please inform the authorized personnel/service department. Rereferencing/resynchronization of the absolute encoder; attach absolute encoder on the load side and configure correctly (e.g. MD 31040 \$MA_ENC_IS_DIRECT).                                         |
| <b>Programm continuation:</b> | Restart part program. Clear alarm with the RESET key in all channels of this mode group. Restart part program.                                                                                                                                                   |

---

**26031 Axis %1 configuration error master-slave**

|                               |                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number                                                                                                                                                              |
| <b>Explanation:</b>           | The alarm is output when the same machine axis has been configured as a master and a slave axis. Each of the axes in the master/slave link can be operated either as master or slave.       |
| <b>Reaction:</b>              | Mode group not ready.<br>The NC switches to follow-up mode.<br>Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm. |
| <b>Remedy:</b>                | - Check machine data for all linked axes and correct if necessary:<br>- MD 37250 \$MA_MS_ASSIGN_MASTER_SPEED_CMD<br>- MD 37252 \$MA_MS_ASSIGN_MASTER_TORQUE_CTR.                            |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                        |

---

**26032 [Channel %1: ] Axis %2 master-slave not configured**

|                               |                                                                                                                                                                                                                                          |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis name, spindle number                                                                                                                                                                                    |
| <b>Explanation:</b>           | The master-slave coupling could not be activated because of incomplete configuration.                                                                                                                                                    |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                   |
| <b>Remedy:</b>                | Check the current configuration of the master-slave coupling.<br>The configuration can be modified via the MASLDEF instruction or the machine data MD37250 \$MA_MS_ASSIGN_MASTER_SPEED_CMD and MD37252 \$MA_MS_ASSIGN_MASTER_TORQUE_CTR. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                     |

---

**26040 Axis %1 encoder parameterization MD %2[%3] has been adjusted.**

|                     |                                                                                                                                                                                 |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Axis number<br>%2 = MD identifier<br>%3 = Machine data index                                                                                                               |
| <b>Explanation:</b> | The parameterization of the encoder in P979 read out from the drive and displayed in the MD does not match the NCK parameterization. The corresponding NCK-MD has been adapted. |

|                               |                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | NC not ready.<br>The NC switches to follow-up mode.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm. |
| <b>Remedy:</b>                | Power on required. This alarm only occurs when the NC-MD is set unequal to the drive parameter.                                                                                                                        |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                               |

---

### 26050 Axis %1 parameter set change from %2 to %3 not possible

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number<br>%2 = Index: current parameter block<br>%3 = Index: new parameter block                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Explanation:</b>           | The parameter block change cannot be performed without jumps. This is due to the content of the parameter block to be switched on, e.g. different load gear factors.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Reaction:</b>              | The NC switches to follow-up mode.<br>Local alarm reaction.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remedy:</b>                | Even with different load gear ratio settings, a parameter block change can be carried out via MD31060 \$MA_DRIVE_AX_RATIO_NUMERA and MD31050 \$MA_DRIVE_AX_RATIO_DENOM without an alarm under the following constraints: Constraints:<br>1. No position control is active, e.g. in follow-up mode or with spindle in speed-controlled mode.<br>2. For position control with the direct encoder.<br>3. For position control with the indirect encoder (the calculated load position difference must not exceed the value in MD36500 \$MA_ENC_CHANGE_TOL). |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### 26051 [Channel %1: ] In block %2 unanticipated stop crossed in continuous path mode

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Explanation:</b>           | The path interpolation did not stop, as required, at the end of the block, but only decelerates to a standstill in the next block. This error situation occurs if the stop at the end of the block was not planned by the path interpolation or was not detected early enough. One possible cause is that the PLC changed the spindle speed when MD35500 \$MA_SPIND_ON_SPEED_AT_IPO_START > 0, and the machine has to wait until the spindle has returned to the setpoint range. Another possible cause is that a synchronized action needs to be finished before path interpolation continues. The alarm is only output if MD11400 \$MN_TRACE_SELECT = 'H400'. The alarm output is normally suppressed. - MD11400 \$MN_TRACE_SELECT has SIEMENS password protection. |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | MD35500 \$MA_SPIND_ON_SPEED_AT_IPO_START = 1. Program G09 before the alarm output in the block to allow the path interpolation to stop as planned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Explanation:</b>           | Synchronism between interpolation and preparation is incorrect.                                                                                                                |
| <b>Reaction:</b>              | <p>Interpreter stop</p> <p>Local alarm reaction.</p> <p>NC Start disable in this channel.</p> <p>Interface signals are set.</p> <p>Alarm display.</p> <p>NC Stop on alarm.</p> |
| <b>Remedy:</b>                | Please contact Siemens.                                                                                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                           |

---

**26054 [Channel %1: ] Block %2 interpolation warning in Look Ahead (module %3, problem %4)**

|                               |                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | <p>%1 = Channel number</p> <p>%2 = Block number, label</p> <p>%3 = Module identifier</p> <p>%4 = Error code</p>      |
| <b>Explanation:</b>           | The computer performance is inadequate to create a smooth path velocity profile. This can lead to drops in velocity. |
| <b>Reaction:</b>              | <p>Local alarm reaction.</p> <p>Alarm display.</p> <p>Warning display.</p>                                           |
| <b>Remedy:</b>                | Change parameterization. Increase interpolation cycle.                                                               |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                         |

---

**26070 [Channel %1: ] Axis %2 cannot be controlled by the PLC, max. number exceeded**

|                     |                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | <p>%1 = Channel number</p> <p>%2 = Axis name, spindle number</p>                                                                    |
| <b>Explanation:</b> | An attempt was made to define more axes than allowed as PLC-controlled axes.                                                        |
| <b>Reaction:</b>    | <p>Interface signals are set.</p> <p>Alarm display.</p>                                                                             |
| <b>Remedy:</b>      | Check the option 'Number of PLC-controlled axes' and correct if necessary or reduce the number of requests for PLC-controlled axes. |

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### **26072 [Channel %1: ] Axis %2 cannot be controlled by the PLC**

**Parameters:** %1 = Channel number  
%2 = Axis name, spindle number

**Explanation:** Axis cannot be made a PLC-controlled axis. For the time being, the axis cannot be controlled at any state from the PLC.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** Use Release or Waitp to make the axis a neutral one.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### **26074 [Channel %1: ] Switching off PLC control of axis %2 not allowed in the current state**

**Parameters:** %1 = Channel  
%2 = Axis, spindle

**Explanation:** The PLC can return the control rights for an axis to program processing only, if the axis is in READY state.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Reset VDI interface signal "PLC controls axis", then activate "Axial reset" and repeat process.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

### **26075 [Channel %1: ] Block %2 Axis %3 not available for the NC program, as exclusively controlled by the PLC**

**Parameters:** %1 = Channel  
%2 = Block number, label  
%3 = Axis, spindle

**Explanation:** The axis is exclusively controlled by the PLC. Therefore, the axis is not available for the NC program.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Have the axis not exclusively controlled by the PLC, but only temporarily. Change MD30460 \$MA\_BASE\_FUNCTION\_MASK, bit 4.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

### **26076 [Channel %1: ] Block %2 Axis %3 not available for NC program, firmly assigned PLC axis**

**Parameters:** %1 = Channel  
%2 = Block number, label  
%3 = Axis, spindle

**Explanation:** The axis is a firmly assigned PLC axis. The axis is therefore not available for the NC program.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Do not define axis as a firmly assigned PLC axis. Change of MD30460 \$MA\_BASE\_FUNCTION\_MASK bit5.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26077 [Channel %1: ] Axis %2 not available for the NC program, as exclusively controlled by the PLC**

**Parameters:** %1 = Channel  
%2 = Axis, spindle

**Explanation:** The axis is exclusively controlled by the PLC. Therefore, the axis is not available for the NC program.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Have the axis not exclusively controlled by the PLC, but only temporarily. Change MD30460 \$MA\_BASE\_FUNCTION\_MASK, bit 4.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26078 [Channel %1: ] Axis %2 not available for NC program, firmly assigned PLC axis**

**Parameters:** %1 = Channel  
%2 = Axis, spindle

**Explanation:** The axis is a firmly assigned PLC axis. The axis is therefore not available for the NC program.

**Reaction:** NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Do not define axis as a firmly assigned PLC axis. Change of MD30460 \$MA\_BASE\_FUNCTION\_MASK bit5.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26080 [Channel %1: ] Retraction position of axis %2 not programmed or invalid**

**Parameters:** %1 = Channel  
%2 = Axis, spindle

**Explanation:** No retraction position has been programmed for the axis trigger time or the position became invalid.

**Reaction:** Alarm display.

**Remedy:** Preset value by means of POLFA(Axis,Type,Pos), with type = 1 (absolut) or type = 2 (incremental); type = 0 specifies the position as invalid.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**26081 [Channel %1: ] Axis trigger of axis %2 was activated, but axis is not PLC-controlled**

**Parameters:** %1 = Channel  
%2 = Axis, spindle

**Explanation:** The axis trigger for single axis was initiated. However, the axis is not PLC-controlled at the trigger time (therefore no single axis) or the position became invalid.

**Reaction:** Alarm display.

**Remedy:** Preset axis PLC-controlled (declare single axis).

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**26082 [Channel %1: ] ESR for PLC-controlled axis %2 has been triggered**

**Parameters:** %1 = Channel  
%2 = Axis, spindle

---

|                               |                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | An axial ESR has been triggered for an individual axis (PLC-controlled axis):<br>The display can be suppressed by MD11410 \$MN_SUPPRESS_ALARM_MASK bit28 = 1.                                                                                                                               |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | The individual axis is in axial stop after the ESR movement.<br>If an axial reset is performed for the individual axis, the alarm will be deleted and the individual axis can be traversed again.                                                                                           |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.<br>The individual axis is in axial stop after the ESR movement.<br>If an axial reset is performed for the individual axis, the alarm will be deleted and the individual axis can be traversed again. |

---

### 26100 Axis %1 drive %2 sign of life missing

|                               |                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number<br>%2 = Drive number                                                                                                                                                                    |
| <b>Explanation:</b>           | Special case: The output of drive number=0 indicates that a computing timeout occurred on the IPO level (see also alarm 4240)                                                                                          |
| <b>Reaction:</b>              | NC not ready.<br>The NC switches to follow-up mode.<br>Mode group not ready, also effective for single axes.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm. |
| <b>Remedy:</b>                | Restart drive, check drive software.                                                                                                                                                                                   |

## 26120 [Channel %1:] Axis %2 \$AA\_ESR\_ENABLE = 1 but axis should be set to NEUTRAL

|                               |                                                                                                                                                                             |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | <p>%1 = Channel</p> <p>%2 = Axis, spindle</p>                                                                                                                               |
| <b>Explanation:</b>           | <p>One axis with ESR configuration and \$AA_ESR_ENABLE[axis] = 1 should be set to NEUTRAL.</p> <p>However, neutral axes (apart from single axes) cannot execute an ESR.</p> |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                              |
| <b>Remedy:</b>                | <p>Set \$AA_ESR_ENABLE[axis] = 0 before setting axis to NEUTRAL.</p> <p>Alarm can be suppressed via MD11415 \$MN_SUPPRESS_ALARM_MASK_2 bit 6 = 1.</p>                       |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                |

---

## 26121 [Channel %1:] Axis %2 is NEUTRAL and \$AA\_ESR\_ENABLE = 1 should be set

|                               |                                                                                                                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | <p>%1 = Channel</p> <p>%2 = Axis, spindle</p>                                                                                                                            |
| <b>Explanation:</b>           | <p>\$AA_ESR_ENABLE[axis] = 1 should not be set to neutral axes (apart from single axes).</p> <p>Neutral axes (apart from single axes) cannot execute an ESR.</p>         |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                           |
| <b>Remedy:</b>                | <p>Do not apply \$AA_ESR_ENABLE[axis] = 1 to neutral axes (apart from single axes).</p> <p>Alarm can be suppressed via MD11415 \$MN_SUPPRESS_ALARM_MASK_2 bit 6 = 1.</p> |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                             |

---

## 26122 [Channel %1:] Axis %2, \$AA\_ESR\_ENABLE = 1, axis exchange not executed in this state

|                    |                                               |
|--------------------|-----------------------------------------------|
| <b>Parameters:</b> | <p>%1 = Channel</p> <p>%2 = Axis, spindle</p> |
|--------------------|-----------------------------------------------|

**Explanation:** With \$AA\_ESR\_ENABLE[axis] = 1 axis exchange not permitted.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Set \$AA\_ESR\_ENABLE[axis] = 0 before axis exchange.

**Programm continuation:** Clear alarm with the RESET key. Restart part program  
Set \$AA\_ESR\_ENABLE[axis] = 0

---

**26126 [channel %1: ] block %2 axis %3: ESRR or ESRS could not be executed, error code %4**

**Parameters:** %1 = Channel  
%2 = Block number, label  
%3 = Axis, spindle  
%4 = Error code

**Explanation:** Writing the data of the part program commands ESRR or ESRS could not be executed.  
Error code:  
1: The indicated axis is not assigned to any axis.  
2: One or more ESR parameters in SINAMICS are not available.  
3: Writing of one or more ESR parameters in SINAMICS was prevented.

**Reaction:** Local alarm reaction.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.  
NC Stop on alarm at block end.

**Remedy:** Error code:  
1: Check the assignment of the NC axes to the drives.  
2: One or more ESR parameters in SINAMICS are not available.  
Check the assignment of the NC axes to the drives.  
Programming of ESRR or ESRS is possible only for SINAMICS as from V4.4.  
The function module "drive-autonomous stop and retract" in SINAMICS not active.  
3: Writing one or more ESR parameters in SINAMICS was prevented.  
Activate the output of additional information alarms through MD11411 \$MN\_ENABLE\_ALARM\_MASK, bit 1 = 1.

**Programm continuation:** Clear alarm with the RESET key. Restart part program  
Writing of the data of the part program commands ESRR or ESRS was refused.  
Check programming  
Acknowledge alarm with reset

---

**26201 [Channel %1: ] Block %2: The ROOT chain element was not found.**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The kinematic chain element with the name specified in MD16800 \$MN\_ROOT\_KIN\_ELEM\_NAME was not found.  
This error does not occur if kinematic chain elements have not been defined, i.e. if all system variables \$NK\_NAME[n] are empty.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Change the content of machine data MD16800 \$MN\_ROOT\_KIN\_ELEM\_NAME so that it refers to an existing, kinematic chain element, or adapt the name of a kinematic chain element to the content of the specified machine data.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

|                               |                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>26202</b>                  | <b>[Channel %1: ] Block %2: The names of the kinematic chain links \$NK_NAME[%3] and \$NK_NAME[%4] are the same</b>                                                   |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Index of 1st chain element<br>%4 = Index of 2nd chain element                                                 |
| <b>Explanation:</b>           | There are (at least) two kinematic chain links with the same name. The names of the kinematic chain links must be clear and identifiable.                             |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                      |
| <b>Remedy:</b>                | Change the names of the kinematic chain links involved                                                                                                                |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                      |
| <b>26204</b>                  | <b>[Channel %1: ] Block %2: The chain element %3 referred to in \$NK_NEXT[%4] is already contained in the chain</b>                                                   |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Name of the next chain link<br>%4 = Index of the chain element                                                |
| <b>Explanation:</b>           | In one chain link, the next link of the chain is indicated as a chain link already in existence in the chain. This allows you to define a not permitted closed chain. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                      |
| <b>Remedy:</b>                | Define the kinematic chain in such a way that no closed chain results.                                                                                                |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                      |
| <b>26208</b>                  | <b>[Channel %1: ] Block %2: Chain element %3, referred to in \$NK_NEXT[%4], was not found</b>                                                                         |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Name of the next chain link<br>%4 = Index of chain link                                                       |
| <b>Explanation:</b>           | The chain link indicated as the next link in a kinematic chain was not found.                                                                                         |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                      |
| <b>Remedy:</b>                | Indicate in \$NK_NEXT[...] the name of an existing chain link.                                                                                                        |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                      |
| <b>26210</b>                  | <b>[Channel %1: ] Block %2: Chain element %3, referred to in \$NK_PARALLEL[%4], was not found</b>                                                                     |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Name of the next, parallel chain element<br>%4 = Index of chain link                                          |
| <b>Explanation:</b>           | The specified parallel chain element was not found.                                                                                                                   |

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** In \$NK\_PARALLEL[...], specify the name of an existing chain element.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**26211 [Channel %1: ] Block %2: \$NK\_SWITCH\_INDEX[%3] is too large.**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Index of the chain element

**Explanation:** The content of \$NK\_SWITCH\_INDEX of a chain element of type "SWITCH" must be greater than or equal to -1 and less than the content of machine data MD18882 \$MN\_MM\_MAXNUM\_KIN\_SWITCHES.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter a permissible value in \$NK\_SWITCH\_INDEX.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**26216 [Channel %1: ] Block %2: The axis direction in chain element %3 has not been defined.**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Fine offset value

**Explanation:** The chain element describes an axis, the direction of which is defined by the value included in \$NK\_OFF\_DIR and \$NK\_OFF\_DIR\_FINE. The definition is valid only if the value of the sum vector and the value of the basic vector \$NK\_OFF\_DIR are higher than 1.0e-6.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter valid vectors in \$NK\_OFF\_DIR and/or \$NK\_OFF\_DIR\_FINE, or change the type of the chain element.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**26218 [Channel %1: ] Block %2: Invalid name in %3[%4]**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Name of the system variable  
%4 = Index of the system variable

**Explanation:** A system variable of type STRING contains an invalid name.

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Use a permissible name.  
The permissible names can be found in the documentation of the system variables involved.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>26220</b>                  | <b>[Channel %1: ] Block %2: unknown element type in \$NK_TYPE[%3]</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Index of the system variable                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Explanation:</b>           | The system variable \$NK_TYPE contains an impermissible element type.<br>The following types are permissible (no distinction between upper and lower case):<br>"OFFSET"<br>"AXIS_LIN"<br>"AXIS_ROT"<br>"ROT_CONST"<br>"SWITCH"<br>This alarm also occurs when the element type of the kinematic chain elements and the axis type of a machine axis entered in \$NK_NAME do not correspond.<br>Example: \$NK_TYPE[...] contains the type "AXIS_LIN" and \$NK_AXIS the string "C1", where C1 is the machine axis identifier of a rotary axis. |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Remedy:</b>                | Use a permissible type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>26237</b>                  | <b>[Channel %1: ] Block %2: \$NP_CHAIN_ELEM[%4] = %3 refers to a chain element of type SWITCH.</b>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Name of the chain element<br>%4 = Index of protection area                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Explanation:</b>           | The component \$NP_CHAIN_ELEM of the specified protection area refers to a chain element of type "SWITCH". Protection areas must not be attached to chain elements of this type.                                                                                                                                                                                                                                                                                                                                                            |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Remedy:</b>                | Attach the protection area to another element in the kinematic chain. For example, an additional element of the type OFFSET with zero length can be inserted before the chain element of the type SWITCH.                                                                                                                                                                                                                                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>26260</b>                  | <b>[Channel %1: ] Block %2: Collision of the two protection areas %3 and %4</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Name of 1st protection area<br>%4 = Name of 2nd protection area                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Explanation:</b>           | The two protection areas named collide in the indicated block, i.e. the distance between the two protection areas is smaller than the value defined by MD10619 \$MN_COLLISION_TOLERANCE.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Reaction:</b>              | Correction block is reorganized.<br>Alarm display.<br>NC Stop on alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Programm continuation:</b> | Clear alarm with NC START or RESET key and continue the program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

---

**26261 [Channel %1: ] The two protection areas %2 and %3 collide**

**Parameters:** %1 = Channel number  
%2 = Name of 1st protection area  
%3 = Name of 2nd protection area

**Explanation:** The two stated protection areas collide.

**Reaction:** Interpreter stop  
Interface signals are set.  
Alarm display.  
NC Stop on alarm.

**Remedy:** Change NC program or definition of the protection areas involved.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

**26265 [Channel %1: ] Block %2: Collision of the two protection areas %3 and %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Name of 1st protection area  
%4 = Name of 2nd protection area

**Explanation:** The two protection areas named collide in the indicated block, i.e. the distance between the two protection areas is smaller than the value defined by MD10619 \$MN\_COLLISION\_TOLERANCE.

**Reaction:** Alarm display.  
NC Stop on alarm.

**Remedy:** Change NC program or definition of the protection areas involved.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26275 [Channel %1: ] : Collision of the two protection areas %3 and %4**

**Parameters:** %1 = Channel number  
%2 = Name of 1st protection area  
%3 = Name of 2nd protection area

**Explanation:** All axes were stopped due to risk of collision.

**Reaction:** Alarm display.

**Remedy:** Move axes out of the danger zone.

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**26278 [Channel %1: ] Block %2: The axis name %3 contained in \$NK\_AXIS[%4] is unknown or invalid**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis or frame name  
%4 = Index of the chain element

**Explanation:** An unknown or invalid name was entered in the element of a kinematic chain in the component \$NK\_AXIS[...].  
The name entered must be a machine axis identifier.  
The alarm also occurs if the name entered in \$NK\_AXIS[...] exists, but the named element is not of the type defined in \$NK\_TYPE[...].  
Example: \$NK\_TYPE[...] contains type "AXIS\_ROT" and \$NK\_AXIS[...] the machine axis identifier of a linear axis, e.g. "X1".

**Reaction:** Correction block is reorganized.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter a valid name in \$NK\_AXIS[...] (machine axis identifier).  
Enter the type of element in \$NK\_TYPE[...] that is referred to by the content of \$NK\_AXIS.

**Programm continuation:** Clear alarm with NC START or RESET key and continue the program.

---

### 26280 [Channel %1: ] Axis %2 risk of collision %3 %4

**Parameters:** %1 = Channel number  
 %2 = Axis name, spindle number  
 %3 = 1st protection area  
 %4 = 2nd protection area

**Explanation:** The indicated axis was stopped due to the risk of collision.

**Reaction:** Alarm display.

**Remedy:** In JOG mode: Retract axis from danger zone.

In automatic mode: Determine reason for the risk of collision and eliminate. Possible reasons: wrong NC program, too large handwheel overrides, axis couplings and vice-versa impairing of two channels.

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

### 26281 [Channel %1: ] Axis %2 risk of collision %3 %4

**Parameters:** %1 = Channel number  
 %2 = Axis name, spindle number  
 %3 = 1st protection area  
 %4 = 2nd protection area

**Explanation:** The stated axis was stopped due to the risk of collision. The programmed path may have been left because it was not possible to stop in time on the path (exceptional situation).

**Reaction:** Local alarm reaction.

NC Start disable in this channel.

Interface signals are set.

Alarm display.

NC Stop on alarm at block end.

**Remedy:** In JOG mode: Retract axis from danger zone.

In automatic mode: Determine reason for the risk of collision and eliminate. Possible reasons: wrong NC program, too large handwheel overrides, axis couplings and vice-versa impairing of two channels.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

The stated axis was stopped due to the risk of collision. The programmed path may have been left because it was not possible to stop in time on the path (exceptional situation).

---

### 26285 [Channel %1: ] Block %2: emergency stop due to collision %3 %4

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %3 = 1st protection area  
 %4 = 2nd protection area

**Explanation:** All axes were stopped via emergency stop due to a collision

**Reaction:** NC Start disable in this channel.

Local alarm reaction.

The NC switches to follow-up mode.

Interface signals are set.

Alarm display.

NC Stop on alarm.

**Remedy:** In Jog mode: move axis out of the collision.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

| <b>Remedy:</b>                | For details, see the external system output.                                                           |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                   |

---

**26371 External collision avoidance: Stop (error on active tool %1, error code %2).**

|                     |                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Tool number<br>%2 = Error code                                                                    |
| <b>Explanation:</b> | The external system is signaling an error on the active tool.                                          |
| <b>Reaction:</b>    | Alarm display.<br>NC Start disable in this channel.<br>NC Stop on alarm.<br>Interface signals are set. |

**Remedy:** Check external system and rectify reported error.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**26372 External collision avoidance: Communication error (OPC UA, error code %1).**

**Parameters:** %1 = Error code  
**Explanation:** An error has occurred in the communication between the external system and the OPC UA Server.  
**Reaction:** Alarm display.  
 NC Start disable in this channel.  
 NC Stop on alarm.  
 Interface signals are set.  
**Remedy:** For details, see the external system output.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**26373 External collision avoidance: Log error (%1, %2).**

**Parameters:** %1 = Error code  
 %2 = Error code  
**Explanation:** An error has occurred in the communication between the external system and the NCK.  
**Reaction:** Alarm display.  
 NC Start disable in this channel.  
 NC Stop on alarm.  
 Interface signals are set.  
**Remedy:** For details, see the external system output.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**26374 External collision avoidance: System is signaling an error (%1, %2, %3, %4).**

**Parameters:** %1 = Error code  
 %2 = Error code  
 %3 = Error code  
 %4 = Error code  
**Explanation:** The external system is signaling an error.  
**Reaction:** Alarm display.  
 NC Start disable in this channel.  
 NC Stop on alarm.  
 Interface signals are set.  
**Remedy:** Check the external system error output / log files for details.  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**26375 External collision avoidance: Stop due to collision (%1, %2).**

**Parameters:** %1 = Error code  
 %2 = Error code  
**Explanation:** The external system reports a collision.  
**Reaction:** Alarm display.  
 NC Start disable in this channel.  
 NC Stop on alarm.  
 Interface signals are set.  
**Remedy:** For details, see the external system output.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**26376 External collision avoidance: System is signaling an error (%1, %2, %3, %4).**

**Parameters:** %1 = Error code  
%2 = Error code  
%3 = Error code  
%4 = Error code

**Explanation:** The external system is signaling an error.

**Reaction:** Alarm display.  
NC Start disable in this channel.  
NC Stop on alarm.  
Interface signals are set.

**Remedy:** Check the external system error output / log files for details.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**26380 [Channel %1: ] Block %2: Incorrect AFIS configuration for axis %3 identifier %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%3 = Axis  
%4 = Error code

**Explanation:** Automatic filter switching (AFIS) is active, but with an incorrect configuration for an axis.

1: The axis is configured as AFIS axis, but no jerk filter is activated by MD32400 \$MA\_AX\_JERK\_ENABLE. The jerk filter must always be active for AFIS axes.  
2: The axis is configured with only one filter chain (e.g. MD32402 \$MA\_AX\_JERK\_MODE=0x). Two filter chains must always be configured for AFIS axes.

**Reaction:** Alarm display.  
Interface signals are set.  
Interpreter stop

**Remedy:** 1: Activate the jerk filter for the axis with MD32400 \$MA\_AX\_JERK\_ENABLE.  
2: a: Parameterize two filter chains for the axis with MD32402 \$MA\_AX\_JERK\_MODE  
b: Deactivate AFIS for the axis: MD32332 \$MA\_AFIS\_ENABLE = FALSE

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**27008 Axis %1 SW limit switch deactivated**

**Parameters:** %1 = Axis name, spindle number

**Explanation:** Via the HMI, the SI acceptance test Safe limit position has been started, for example with the acceptance test wizard. For these acceptance tests, the single-channel software limit switches are deactivated for the axis/spindle, in order to assure that the safe limit positions can be approached.

**Reaction:** Alarm display.  
Deactivation of the single-channel software limit switch for the displayed axis/spindle.

**Remedy:** Deselect the acceptance test, for example with the acceptance test wizard, or wait until completed.

**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**27033      Axis %1 parameterisation of MD %2[%3] invalid, error code %4**

**Parameters:**    %1 = Axis name, spindle number  
                     %2 = MD name  
                     %3 = MD array index for MD name  
                     %4 = Error code, reference to the cause (see alarm description)

**Explanation:**

The parameterization of the specified machine data is incorrect. An additional indication is the array index of the machine data. If the machine data is a single machine data item, a zero is specified as the array index. This alarm occurs in accordance with the displayed error code in the following connections:

- 1: Conversion of the specified MD to the internal calculation format causes an overflow.
- 2: Error in parameterization of the input/output assignments for the SGEs/SGAs.
- 3: One of the activated cam positions lies outside the actual value modulo range.
- 4: The function "actual value synchronization 2-encoder system" (slip) has been selected for a 1-encoder system.
- 5: The function "actual value synchronization 2-encoder system" (slip) has been selected at the same time as a function with an absolute reference (SE/SN).
- 6: A safety function has been enabled in MD36901 \$MA\_SAFE\_FUNCTION\_ENABLE although the safety functions SBH/SG have not been enabled.
- 7: An axis-specific SGE/SGA has been parameterized on the SPL interface (segment number = 4) and the function enable for the external stops (MD36901 \$MA\_SAFE\_FUNCTION\_ENABLE, bit 6) is missing.
- 8: The cam synchronization has been activated via bit 7 in MD36901 \$MA\_SAFE\_FUNCTION\_ENABLE without enabling the cams via bits 8...15.
- 12: A zero has been entered in MD36917 \$MA\_SAFE\_ENC\_GRID\_POINT\_DIST.
- 13: A zero has been entered in MD36918 \$MA\_SAFE\_ENC\_RESOL.
- 14: The parameterized cam modulo range MD36905 \$MA\_SAFE\_MODULO\_RANGE is not an integer multiple of 360 degrees.
- 15: An axis-specific SGE/SGA has been parameterized on the SPL interface (segment number = 4) and SGE "Deselection ext. stop A" (assigned via MD36977 \$MA\_SAFE\_EXT\_STOP\_INPUT[0]) has been parameterized inverted (bit 31 = 1) or SGE "Deselection ext. stop A" has not been parameterized on the SPL interface \$A\_OUTSI.
- 16: MD10097 \$MN\_SAFE\_SPL\_STOP\_MODE has been parameterized on value 4 (stop E) although the external stop E has not been enabled on all axes with SI function enables (MD36901 \$MA\_SAFE\_FUNCTION\_ENABLE not equal to 0).
- 17: In MD36907 \$MA\_SAFE\_DRIVE\_PS\_ADDRESS, an invalid value has been parameterized or the same address has been assigned to multiple axes.
- 18: The internal preassignment of MD36919 \$MA\_SAFE\_ENC\_PULSE\_SHIFT from the drive parameterization was not possible because values would have to be set outside the permissible range. Adjust the encoder parameterization in the drive.
- 19: MD36932 \$MA\_SAFE\_VELO\_OVR\_FACTOR has been parameterized with decimal places.
- 20: The value entered in MD36934 \$MA\_SAFE\_POS\_LIMIT\_PLUS and MD36935 \$MA\_SAFE\_POS\_LIMIT\_MINUS have been swapped. The upper limit is less than or equal to the lower limit.
- 21: In MD30300 \$MA\_IS\_ROT\_AX and MD36902 \$MA\_SAFE\_IS\_ROT\_AX, various settings have been made.
- 22: The parameterized cam modulo range MD36905 \$MA\_SAFE\_MODULO\_RANGE and the modulo range in MD30330 \$MA\_MODULO\_RANGE are not divisible by one another with an integer result.
- 23: Testing of the brake mechanism was enabled without enabling safe operation for this axis in MD36901 \$MA\_SAFE\_FUNCTION\_ENABLE or enabling the link to the drive-autonomous safety functions in MD37950 \$MA\_SAFE\_INFO\_ENABLE. Testing of the brake mechanism is only permissible with safety functions in this axis.
- 24: MD36961 \$MA\_SAFE\_VELO\_STOP\_MODE or MD36963 \$MA\_SAFE\_VELO\_STOP\_REACTION has been parameterized with an impermissible value.
- 25: Alarms 27000/F01797 are to be suppressed during parking (MD36965 \$MA\_SAFE\_PARK\_ALARM\_SUPPRESS!=0). For this, SGA "Axis safely referenced" must be parameterized in MD36987 \$MA\_SAFE\_REFP\_STATUS\_OUTPUT.
- 26: The logical base address configured in Step 7 and addressed in MD36906 \$MA\_SAFE\_CTRLOUT\_MODULE\_NR, MD10393 \$MN\_SAFE\_DRIVE\_LOGIC\_ADDRESS do not match, or the slot addressed in this way has the wrong length.
- 27: Cam position MD36936 \$MA\_SAFE\_CAM\_POS\_PLUS[n] or MD36937 \$MA\_SAFE\_CAM\_POS\_MINUS[n] is parameterized too near to the modulo limit.
- 28: In MD36901 \$MA\_SAFE\_FUNCTION\_ENABLE, "Safe cams" are enabled in bits 8...15, while in MD36903 \$MA\_SAFE\_CAM\_ENABLE the function "Safe cam track" is enabled.
- 29: Minus cam position MD36937 \$MA\_SAFE\_CAM\_POS\_MINUS[n] is greater than the plus cam position MD36936 \$MA\_SAFE\_CAM\_POS\_PLUS[n]. This is not allowed for the function "Safe cam track."
- 30: The distance between 2 cams on one cam track (MD36937 \$MA\_SAFE\_CAM\_POS\_MINUS[n] and MD36936 \$MA\_SAFE\_CAM\_POS\_PLUS[m]) is too small. ("Safe cam track" function)
- 31: The cam length, that is the distance between plus cam position (MD36936 \$MA\_SAFE\_CAM\_POS\_PLUS[n]) and minus cam position (MD36937 \$MA\_SAFE\_CAM\_POS\_MINUS[n]), is too small. ("Safe cam track" function)
- 32: For at least 2 cams enabled in MD36903 \$MA\_SAFE\_CAM\_ENABLE, identical values are entered in MD36938 \$MA\_SAFE\_CAM\_TRACK\_ASSIGN[n]. ("Safe cam track" function)

- 33: The value parameterized in MD36938 \$MA\_SAFE\_CAM\_TRACK\_ASSIGN[n] for a cam enabled in MD36903 \$MA\_SAFE\_CAM\_ENABLE is invalid. ("Safe cam track" function)
- 34: More than 15 cams have been assigned to one cam track in MD36938 \$MA\_SAFE\_CAM\_TRACK\_ASSIGN[n]. ("Safe cam track" function)
- 35: Cam modulo functionality has been selected in MD36905 \$MA\_SAFE\_MODULO\_RANGE, although this is not supported for the "Safe cam track" function.
- 36: The parameterized monitoring cycle time MD10091 \$MN\_INFO\_SAFETY\_CYCLE\_TIME does not match the monitoring cycle time parameterized in the drive monitoring channel (p9500).
- 37: The velocity hysteresis n<nx in MD36947 \$MA\_SAFE\_VELO\_X\_HYSTERESIS is greater than 3/4 of the velocity limit n<nx in MD36946 \$MA\_SAFE\_VELO\_X.
- 38: The velocity hysteresis n<nx in MD36947 \$MA\_SAFE\_VELO\_X\_HYSTERESIS is less than or equal to 0.
- 39: The velocity tolerance n<nx in MD36947 \$MA\_SAFE\_VELO\_X\_HYSTERESIS is less than the slip tolerance in MD36949 \$MA\_SAFE\_SLIP\_VELO\_TOL.
- 40: An axis-specific SGE/SGA addresses the SPL interface outside of the scope enabled by the relevant option.
- 41: The total encoder resolution (combination of coarse and fine resolution in MD36918 \$MA\_SAFE\_ENC\_RESOL and MD36919 \$MA\_SAFE\_ENC\_PULSE\_SHIFT) is invalid or exceeds the supported actual value format.
- 42: Simultaneous enable of NC-controlled brake test and drive-integrated brake test is not permitted.
- 43: For an axis with safety functions, no PROFIdrive drive has been parameterized in MD30100 \$MA\_CTRLOUT\_SEGMENT\_NR for the setpoint/actual value channel assignment. Enable SIC/SCC link (MD37950 \$MA\_SAFE\_INFO\_ENABLE) or reset the NC-controlled brake test enable (MD37000 \$MA\_FIXED\_STOP\_MODE).

**Reaction:**

Mode group not ready.  
 Channel not ready.  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.

**Remedy:**

Check and change the specified MD. Allow the checksum to be recalculated. Re-accept safety functions.

**Programm****continuation:**

Switch control OFF - ON.

---

**27811 Axis %1 Parameterizing error: MD %2 [%3] invalid**
**Parameters:**

%1 = Axis name, spindle number  
 %2 = MD name  
 %3 = MD array index for MD name

**Explanation:**

The parameterization of the displayed machine data is incorrect.  
 This alarm occurs in the following contexts:

- During evaluation of the SIC/SCC telegram number in MD13376 \$MN\_SAFE\_INFO\_TELEGRAM\_TYPE or in drive parameter p60122, an invalid SIC/SCC telegram number was found (not equal to 701).
- The check of the logical base addresses from MD13374 \$MN\_SAFE\_INFO\_DRIVE\_LOGIC\_ADDR has indicated that a slot with this address does not exist, or the SIC/SCC telegram has an incorrect length and "SIC/SCC" communication cannot be enabled.

**Reaction:**

Mode group not ready.  
 Channel not ready.  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.  
 NC Stop on alarm.  
 Prevention of cyclic PROFIsafe communication between PLC and drive.  
 Prevention of cyclic SIC/SCC communication between the NCK and drive.

**Remedy:**

Parameterize a valid SIC/SCC telegram number (701).  
 Configure or parameterize with valid logical basis addresses for the SIC/SCC slots or PROFIsafe slots.

**Programm****continuation:**

Switch control OFF - ON.

---

**27812      Axes %1 and %2 parameterized with the same SIC/SCC address %3.**

**Parameters:**      %1 = Axis name, spindle number  
                     %2 = Axis name, spindle number  
                     %3 = Logical base address SIC/SCC

**Explanation:**      The same base address for communication with a drive was selected for the specified axes. This is not permissible.

**Reaction:**          Mode group not ready.  
                     Channel not ready.  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.  
                     NC Stop on alarm.

**Remedy:**            Correct the drive assignment for the two specified axes.  
                     Different logical base addresses must be selected for assignment to the specified axes via MD37954  
                     \$MA\_SAFE\_INFO\_MODULE\_NR and MD13374 \$MN\_SAFE\_INFO\_DRIVE\_LOGIC\_ADDR.

**Programm  
continuation:**      Switch control OFF - ON.

---

**27813      F logic option not set**

**Explanation:**      The option for F logic MD19500 \$ON\_SAFE\_PLC\_LOGIC is not available.  
                     The safety operating mode "SINUMERIK Safety Integrated plus (F-PLC)" is set in the MD13370 \$MN\_SAFE\_MODE.

**Reaction:**          NC not ready.  
                     Channel not ready.  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.  
                     NC Stop on alarm.  
                     Prevention of cyclic PROFIsafe communication between PLC and drive.  
                     Prevention of cyclic SIC/SCC communication between the NCK and drive.

**Remedy:**            Align option data and safety operating mode.

**Programm  
continuation:**      Switch control OFF - ON.

---

**27830      Axis %1 Control not ready for the drive-integrated safe brake test**

**Parameters:**      %1 = Axis name, spindle number

**Explanation:**      The motion control rejects the request for the drive-integrated "safe brake test" via the VDI interface.  
                     Possible causes:

- When the brake test was selected via the VDI, the interpolator or the axis had not stopped, therefore the axis in motion or exact stop was not (no longer) given.
- A new brake test was requested, but the previous brake test had not yet finished in the control.
- Another axis was in motion in the channel.

**Reaction:**          Alarm display.

**Remedy:**            The alarm disappears automatically if the conditions in the motion control for performing the drive-integrated "safe brake test" are fulfilled, or the request for the drive-integrated "safe brake test" is withdrawn.

**Programm  
continuation:**      Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**27900      PROFIBUS DP: SI fault on axis %1, code %2, value %3, time %4.**

**Parameters:**      %1 = Axis name, spindle number  
                     %2 = Fault code of the drive (r9747).  
                     %3 = Fault value of the drive (r9749)  
                     %4 = Fault time of drive (r9748).

---

|                               |                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The drive signals SI fault %2 with the further information %3 at instant %4.           |
| <b>Reaction:</b>              | Alarm display.                                                                         |
| <b>Remedy:</b>                | See drive documentation for fault codes/fault values.                                  |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary. |

---

### **27910 PROFIBUS DP: SI fault on axis %1, code %2, value %3, time %4.**

|                               |                                                                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Axis name, spindle number<br>%2 = Fault code of the drive (r9747).<br>%3 = Fault value of the drive (r9749)<br>%4 = Fault time of drive (r9748).                                 |
| <b>Explanation:</b>           | The drive signals SI fault %2 with the further information %3 at instant %4.                                                                                                          |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Alarm display.<br>A start of the part program is prevented by an SI fault reported by the drive.<br>The SI fault requires a safe acknowledgment. |
| <b>Remedy:</b>                | See drive documentation for fault codes/fault values.                                                                                                                                 |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                |

---

### **29033 [Channel %1: ] Axis exchange of axis %2 not possible, PLC axis movement not yet completed**

|                               |                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Axis                                                                                                                                  |
| <b>Explanation:</b>           | A PLC axis has not yet reached its end position and cannot be returned to a channel or neutralized. This alarm should not occur when PLC data block FC18 is used. |
| <b>Reaction:</b>              | NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.<br>NC Stop on alarm.                                                            |
| <b>Remedy:</b>                | Wait until the axis has reached the end position or terminate the movement with delete distance to go.                                                            |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                              |

## Cycle alarms

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>61000</b>                  | <b>%[[Channel %1: ] Block %2: %]No tool offset active</b>                                             |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           |                                                                                                       |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | D-correction must be programmed before the cycle call.                                                |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |
| <b>61001</b>                  | <b>[Channel %1: ] Block %2: Thread pitch incorrectly defined</b>                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           |                                                                                                       |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Check parameter for the thread size or setting for the pitch (contradict each other).                 |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |
| <b>61002</b>                  | <b>%[[Channel %1: ] Block %2: %]Type of machining incorrectly defined</b>                             |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           |                                                                                                       |
| <b>Remedy:</b>                | Modify VARI parameter.                                                                                |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |
| <b>61003</b>                  | <b>%[[Channel %1: ] Block %2: %]No feed programmed in cycle</b>                                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           |                                                                                                       |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Modify feed parameter.                                                                                |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61004 [Channel %1: ] Block %2: Incorrect configuration of geometry axes**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

--

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61005 [Channel %1: ] Block %2: 3rd geometry axis not available**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** With an application on the turning machine with no Y-axis in the G18 plane.

**Remedy:** Check parameter on cycle call.

---

**61006 %[[Channel %1: ] Block %2: %]Tool radius too large**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The tool radius is too large for machining.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select a smaller tool.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61007 [Channel %1: ] Block %2: Tool radius too small**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The tool radius is too small for machining.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select a larger tool.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61008 [Channel %1: ] Block %2: No tool active**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Alarm triggered by following cycles:

**Remedy:** Select a tool.

---

---

**61009 [Channel %1: ] Block %2: Active tool number = 0**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** No tool (T) has been programmed before the cycle call.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Program tool (T).

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61010 [Channel %1: ] Block %2: Finishing allowance too large**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Causes of error:  
- The finishing allowance for the base is greater than the total depth.  
- The finishing allowance at the edge is greater than or equal to the tool diameter.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Reduce finishing allowance.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61011 [Channel %1: ] Block %2: Scaling not permissible**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** A scale factor is active which is illegal for this cycle.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Modify scale factor.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61012 %[[Channel %1: ] Block %2: %]Different scaling in planes**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61013 [Channel %1: ] Block %2: Basic settings were changed, program cannot be executed**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:** The basic settings are not compatible with the generated program.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Check and, if necessary, change the basic settings.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61014 [Channel %1: ] Block %2: Return plane exceeded**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:**

**Remedy:** Check parameter RTP.

---

**61015 [Channel %1: ] Block %2: Contour is not defined**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:**

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61016 [Channel %1: ] Block %2: System frame for cycles missing**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:**

**Remedy:** Set machine data 28082 \$MC\_MM\_SYSTEM\_FRAME\_MASK, Bit 5=1.

---

**61017 %[[Channel %1: ] Block %2: %]Function %4 not present in NCK**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:**

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

| <b>Explanation:</b> | Alarm 61019 is output in very many cycles if transfer parameters have been incorrectly programmed.<br>The alarm text states the name of the incorrect parameter.<br>Example cycle POCKET3: Parameter _MIDA defined incorrectly.<br>The specified parameter then has to be checked and changed.<br>For parameters in which multiple selection options are coded by individual decimal digits, the incorrectly coded digit is also output.<br>Example: 61019 parameter (S_MVAR: dec4) defined incorrectly<br>The value of the 4th decimal place (dec4 -> THOUSANDS digit) of the transfer parameter S_MVAR is defined incorrectly |
| <b>Reaction:</b>    | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**61024 [Channel %1: ] Block %2: Parameter %4 check value**

|                     |                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label channel number                                        |
| <b>Explanation:</b> |                                                                                                       |
| <b>Reaction:</b>    | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |

**Remedy:** If the error message comes from CYCLE9960:  
Start/end RA1: Set measuring range is not compatible with the traversing range (machine data 36100 \$MA\_POS\_LIMIT\_MINUS) of rotary axis 1.  
Start/end RA2: Set measuring range is not compatible with the traversing range (machine data 36100 \$MA\_POS\_LIMIT\_MINUS) of rotary axis 2.  
The measuring range is always considered in the clockwise direction from the start to the end  
Example: Start = 0°, end = -45°, traversing range of the axis -90°..90° => error because the measuring range is interpreted from 0° to 315° and not from -45° to 0°.  
Error message is displayed when measuring the kinematics of a grinding machine:  
1st measurement: Starting position is "Beta" = 0°, "Beta" <> 0° leads to the error message.  
For the 2nd and 3rd measurements, "Beta" has to be rotated further, either in the positive or negative direction. A change in the direction of rotation leads to the error message.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61025 [Channel %1: ] Block %2: Check tool carrier position**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61026 [Channel %1: ] Block %2: Cycle cannot be executed with NC function %4.**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61027 %[[Channel %1: ] Block %2: %]Subroutine %4 does not exist**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

- Check CYCLE62 call
- Check whether the subroutines specified on CYCLE62 call exist in the program storage

**Programm continuation:** Clear alarm with the RESET key. Restart part program

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61032 [Channel %1: ] Block %2: File not found: %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61033 [Channel %1: ] Block %2: Incorrect file type: %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61034 [Channel %1: ] Block %2: File is full: %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61035 [Channel %1: ] Block %2: File in use: %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61036 [Channel %1: ] Block %2: NC storage limit reached: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61037 [Channel %1: ] Block %2: No access rights to file: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61038 [Channel %1: ] Block %2: Other file error: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61039 [Channel %1: ] Block %2: Line not available: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61040 [Channel %1: ] Block %2: Line longer than result variable: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61041 [Channel %1: ] Block %2: Line range too large: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61042 [Channel %1: ] Block %2: Program name %4 illegal**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** In the case of multi-channel systems, the main program name must not end with \_Cxx (xx stands for figures).  
Rename main program.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61043 [Channel %1: ] Block %2: Error affecting coordinate conversion (%4)**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**61046 [Channel %1: ] Block %2: Part program not found in job list: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Part program (main program) not found in specified job list in respective channel.  
Check name and contents of job list.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61047 [Channel %1: ] Block %2: Label name %4 too long**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** - select shorter label name

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61048 [Channel %1: ] Block %2: Multi-channel data not found in job list: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Multi-channel data not found in job list.  
Correct job list.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61049 [Channel %1: ] Block %2: 1st spindle not programmed**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Program 1st spindle in the screen.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61054 [Channel %1: ] Block %2: Programs started from various job lists: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Programs from various job lists were started simultaneously.  
This is illegal. All programs must be assigned to the same job list.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select desired job list again, and start programs afresh.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61055 [channel %1: ] block %2: magazine location number too low: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The magazine location number entered was too low.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61056 [channel %1: ] block %2: magazine location number too high: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The magazine location number entered was too high.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61057 [Channel %1: ] Block %2: magazine location number is no integer: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The magazine location number must be an integer.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61062      %[[Channel %1: ] Block %2: %]Axis position %4incorrectly programmed**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            Check the last programmed axis position

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61063      %[[Channel %1: ] Block %2: %]Tool at magazine location %4 is not a multitool**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**      A magazine location and a multitool location were programmed. However, there is no multitool at the magazine location.

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            Only program the magazine location (without multitool location).

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61064      %[[Channel %1: ] Block %2: %]Invalid multitool location: %4**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**      A multitool location was programmed, at which there is no multitool.

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            Program a valid multitool location.

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61065      [Channel %1: ] Block %2: A channel specified in the job list does not exist: %4**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**      A non-existent channel was specified in the job list.

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            Correct job list

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

---

**61066      %[[Channel %1: ] Block %2: %]Cycle %4 requires G code G70 or G71**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**    Cycle requires G code G70 or G71

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**          Program G70 or G71

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61067      [Channel %1: ] Block %2:Tool spindle is in spindle mode: %4**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**    To activate the turning transformation, the tool spindle must be in axis mode. But it is in spindle mode.

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**          Before activating the turning transformation, put the tool spindle in axis mode (with SPOS or M70).

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61068      [Channel %1: ] Block %2: Cycle requires G code %4**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**    An incorrect G code is active when the cycle is called.

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**          Activate the stated G code before calling the cycle. Multiple G codes may be presented for selection.  
                      Example: Cycle requires G code: G70/G71

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61069      [Channel %1: ] Block %2: Axis not referenced %4**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**    A referenced axis is required in the cycle, but an unreferenced axis was detected.  
                      If possible, the axis identifier is stated in the alarm text.

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**          Reference axis before calling the cycle.

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

**61129 [Channel %1: ] Block %2: perpendic. approach and retraction during contour milling only allowed with G40**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61130 [Channel %1: ] Block %2: positions of parallel axes cannot be compensated. No workpiece reference agreed.**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61131 [Channel %1: ] Block %2: parameter \_GEO incorrect, \_GEO=%4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61132 [Channel %1: ] Block %2: Parallel axis parameters incorrect, check values for parallel axis parameters ABS/INK**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61137 [Channel %1: ] Block %2: swiveling and parallel axes cycle are mutually exclusive because of workpiece reference \$P\_WPFRAME**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61138 [Channel %1: ] Block %2: parameter %4 incorrectly defined for tool monitoring in cycles**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61139 [Channel %1: ] Block %2: error in function Tool monitoring in cycles**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61140 [Channel %1: ] Block %2: Main spindle is not set up correctly**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please check the following machine or setting data:  
MD 20070 \$MC\_AXCONF\_MACHAX\_USED[]  
MD 20080 \$MC\_AXCONF\_CHANAX\_NAME\_TAB[]  
MD 35000 \$MA\_SPIND\_ASSIGN\_TO\_MACHAX[]  
MD 52206 \$MCS\_AXIS\_USAGE[]

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

### **61141 [Channel %1: ] Block %2: C axis of the main spindle is not set up correctly**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please check the following machine or setting data:  
MD 20070 \$MC\_AXCONF\_MACHAX\_USED[]  
MD 20080 \$MC\_AXCONF\_CHANAX\_NAME\_TAB[]  
MD 35000 \$MA\_SPIND\_ASSIGN\_TO\_MACHAX[]  
MD 52206 \$MCS\_AXIS\_USAGE[]

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

### **61142 [Channel %1: ] Block %2: Counterspindle is not set up correctly**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please check the following machine or setting data:  
MD 20070 \$MC\_AXCONF\_MACHAX\_USED[]  
MD 20080 \$MC\_AXCONF\_CHANAX\_NAME\_TAB[]  
MD 35000 \$MA\_SPIND\_ASSIGN\_TO\_MACHAX[]  
MD 52206 \$MCS\_AXIS\_USAGE[]

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

### **61143 [Channel %1: ] Block %2: C axis of the counterspindle is not set up correctly**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please check the following machine or setting data:  
MD 20070 \$MC\_AXCONF\_MACHAX\_USED[]  
MD 20080 \$MC\_AXCONF\_CHANAX\_NAME\_TAB[]  
MD 35000 \$MA\_SPIND\_ASSIGN\_TO\_MACHAX[]  
MD 52206 \$MCS\_AXIS\_USAGE[]

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61144 [Channel %1: ] Block %2: Tool spindle is not set up correctly**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please check the following machine or setting data:  
MD 20070 \$MC\_AXCONF\_MACHAX\_USED[]  
MD 20080 \$MC\_AXCONF\_CHANAX\_NAME\_TAB[]  
MD 35000 \$MA\_SPIND\_ASSIGN\_TO\_MACHAX[]  
MD 52206 \$MCS\_AXIS\_USAGE[]

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61145 [Channel %1: ] Block %2: Linear axis of the counterspindle is not set up correctly**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please check the following machine or setting data:  
MD 20070 \$MC\_AXCONF\_MACHAX\_USED[]  
MD 20080 \$MC\_AXCONF\_CHANAX\_NAME\_TAB[]  
MD 52206 \$MCS\_AXIS\_USAGE[]

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61146 [Channel %1: ] Block %2: B axis is not set up correctly**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please check the following machine or setting data:  
MD 20070 \$MC\_AXCONF\_MACHAX\_USED[]  
MD 20080 \$MC\_AXCONF\_CHANAX\_NAME\_TAB[]  
MD 35000 \$MA\_SPIND\_ASSIGN\_TO\_MACHAX[]  
MD 52206 \$MCS\_AXIS\_USAGE[]

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61147 [Channel %1: ] Block %2: Transformation not active: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** The stated transformation is not active.  
 You have to activate the transformation before you can use it.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61148 [Channel %1: ] Block %2: Swivel plane with active turning tool not possible**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** Swiveling the plane is not possible when a turning tool is active.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Load a milling tool before you swivel the plane.  
 The alarm can be suppressed using SD 55410 \$SCS\_MILL\_SWIVEL\_ALARM\_MASK.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61149 [Channel %1: ] Block %2: Positioning a milling tool with active turning tool is not possible**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** Milling tools cannot be positioned if a turning tool is active.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Load a milling tool, before you call positioning.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61150 [Channel %1: ] Block %2: Tool cannot be aligned - error code: %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

**Remedy:** Error code:  
 A: Only new swivel plane permitted, see parameter \_ST  
 B: Angular range  $\geq 360$  -> angular range of the B axis  $\geq 360$  degrees  
 C: Rotary axis vector V1 is not equal to 0 1 0 -> rotary axis vector V1 must rotate around Y  
     See setup of swivel CYCLE800  
 D: Rotary axis vector V2 -> rotary axis vector V2 must rotate around X (1 0 0) or Z (0 0 1)  
     See setup of swivel CYCLE800  
 E: WCS ROT Y  $> 90$  -> active rotation of the Work (WCS) around Y is  $>90$  degrees. -90 to +90 is permitted  
 F: If geometry axis Y is not available -> SD55221 set Bit 5 = 1  
 G: Initial setting defines (\$TC\_CARR37] HUNDREDTHOUSANDS digit -Z or -X) -> SD55221 set Bit 5 = 1  
     See setup of swivel CYCLE800  
 H: Align tool, but active plane not G18  
 I: 1st turning technology (MD52200=1) and no Y axis available -> mirroring not allowed  
 J: 1st turning technology (MD52200=1) and no Y axis available -> rotation around Y not possible  
 K: Grinding technology (MD52200=3) and align tool -> SD55221 set Bit 5 = 1  
 L: Grinding technology (MD52200=3) and align tool -> set MD20186 = 1

---

**61151 [Channel %1: ] Block %2: Orientation of tool not possible - error code: %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

**Remedy:** Causes of error:  
 1st error code = A -> only additive swivel plane permitted, see parameter \_ST

---

**61152 [Channel %1: ] Block %2: B axis kinematics (turning technology) either not or incorrectly set up in Start-up of swivel cycle - error code: %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

**Remedy:** Causes of error:  
 1st error code = A123 -> B axis not an automatic rotary axis under ShopTurn (123 corresponds to parameter \_TCBA)  
 2nd error code = B123 -> B axis not activated in swivel cycle start-up (kinematics)  
     (123 corresponds to \$TC\_CARR37[n], n ... number of the swivel data record)

---

**61153 [Channel %1: ] Block %2: No 'Rotary axes direct' swivel mode possible - error code: %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remedy:</b> | <p>Error code:</p> <p>A: No tool or no cutting edge (e.g. D1) active</p> <p>B: Swivel "no" and swivel "direct", swivel plane "additive" not permitted</p> <p>C: Input value for rotary axis 1 not in the grid of the Hirth tooth system</p> <p>D: Input value for rotary axis 2 not in the grid of the Hirth tooth system</p> <p>E: Swivel "direct" programmed in automatic, but swivel cycle not set up (\$TC_CARR37 UNITS digit &lt; =2)</p> <p>F ROT ? G5...: Rotation in settable WO (e.g. G54) active, not permitted</p> <p>F ROT ? SETFRAME: Rotation in basic reference active, not permitted</p> <p>F ROT ? CHBFRAME: Rotation in basic active, not permitted</p> <p>G WPFRAME?: Swivel mode additive and translations in workpiece reference (WPFRAME) not permitted</p> <p>H: X0, Y0 or Z0 not equal to 0: Swivel mode additive and translations not permitted before swivel</p> <p>See parameter S_ST 1st decimal place</p> <p>I: Turning machine and initial setting -X or -Z not possible in G18</p> <p>J: Turning machine and initial setting -X or -Z and counterspindle mirrored around Z</p> <p>K: Turning machine and initial setting -Z and G19 not allowed</p> <p>Initial setting, see setup of swivel CYCLE800</p> <p>Note on error codes F, G and H:</p> <p>If the Work (WCS) is rotated before programming swivel direct, and the swivel plane is rotated and moved additively, alarm 61153 is reported with error codes F, G or H to avoid an impermissible mixing of frame operations and direct machine positions.</p> <p>Alternatively, the machining program can be reprogrammed with swivel axis for each axis and swivel plane new or additionally,</p> <p>or with new swivel and swivel plane.</p> |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

---

#### 61154      %[[Channel %1: ] Block %2: %]Final depth wrongly programmed

|                     |                                                                           |
|---------------------|---------------------------------------------------------------------------|
| <b>Parameters:</b>  | <p>%1 = Channel number</p> <p>%2 = Block number, label channel number</p> |
| <b>Explanation:</b> |                                                                           |
| <b>Remedy:</b>      | Input of end depth possible only absolutely or incrementally              |

---

#### 61155      [Channel %1: ] Block %2: Unit for plane infeed wrongly programmed

|                     |                                                                           |
|---------------------|---------------------------------------------------------------------------|
| <b>Parameters:</b>  | <p>%1 = Channel number</p> <p>%2 = Block number, label channel number</p> |
| <b>Explanation:</b> |                                                                           |
| <b>Remedy:</b>      | Unit for plane infeed possible only in mm or % of tool diameter           |

---

#### 61156      [Channel %1: ] Block %2: Depth calculation wrongly programmed

|                     |                                                                           |
|---------------------|---------------------------------------------------------------------------|
| <b>Parameters:</b>  | <p>%1 = Channel number</p> <p>%2 = Block number, label channel number</p> |
| <b>Explanation:</b> |                                                                           |
| <b>Remedy:</b>      | Depth calculation possible only with or without SDIS                      |

---

#### 61157      %[[Channel %1: ] Block %2: %]Reference point wrongly programmed

|                     |                                                                           |
|---------------------|---------------------------------------------------------------------------|
| <b>Parameters:</b>  | <p>%1 = Channel number</p> <p>%2 = Block number, label channel number</p> |
| <b>Explanation:</b> |                                                                           |

- Remedy:**
- Check reference point in screenform, input only -X, centered or +X
  - During calibration of the length of the infeed axis in JOG, two causes can cause this alarm:
    1. The value of the reference workpiece was incorrectly programmed in the parameterization screenform.
    2. The length of the workpiece probe in the infeed axis has been incorrectly entered in the tool data.

---

**61158      %[[Channel %1: ] Block %2: %]Machining plane wrongly programmed**

**Parameters:**    %1 = Channel number  
                       %2 = Block number, label channel number

**Explanation:**

**Remedy:**        Check machining plane (G17, G18 or G19) in connection with the parameter \_DMODE.

---

**61159      [Channel %1: ] Block %2: Machining plane on cycle call differs from the one in the position pattern**

**Parameters:**    %1 = Channel number  
                       %2 = Block number, label channel number

**Explanation:**

**Remedy:**        Adjust the machining plane on cycle call to the machining plane in the position pattern.

---

**61160      [Channel %1: ] Block %2: Residual material remains stationary, reduce plane infeed**

**Parameters:**    %1 = Channel number  
                       %2 = Block number, label channel number

**Explanation:**

**Remedy:**        Reduce plane infeed or slot width, or use milling cutter with larger diameter

---

**61161      [Channel %1: ] Block %2: Centering diameter or tool parameter (diameter, tip angle) are incorrect**

**Parameters:**    %1 = Channel number  
                       %2 = Block number, label channel number

**Explanation:**

- Remedy:**
- Diameter of centering with tip angle of active tool not possible
  - Entered workpiece diameter, tool diameter or tip angle of tool incorrect
  - Diameter of tool only has to be entered if centering is to be on workpiece diameter.

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61162      [Channel %1: ] Block %2: Tool parameter diameter or tip angle incorrect**

**Parameters:**    %1 = Channel number  
                       %2 = Block number, label channel number

**Explanation:**

- Remedy:**
- The tool parameters diameter or tip angle must be greater than 0
  - Tip angle must be less than 180°

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61163      [Channel %1: ] Block %2: Infeed width in the plane too large**

**Parameters:**    %1 = Channel number  
                       %2 = Block number, label

**Explanation:**

**Remedy:**        --

|                     |                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------|
| <b>61164</b>        | <b>[Channel %1: ] Block %2: Transformation has incorrect type %4</b>                                        |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                             |
| <b>Explanation:</b> |                                                                                                             |
| <b>Remedy:</b>      | The transformation has the incorrect type. Correct the transformation set up.                               |
| <b>61165</b>        | <b>[Channel %1: ] Block %2: Transformation set up incorrectly: %4</b>                                       |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                             |
| <b>Explanation:</b> |                                                                                                             |
| <b>Remedy:</b>      | The transformation has been set up incorrectly. Correct the transformation set up.                          |
| <b>61166</b>        | <b>[Channel %1: ] Block %2: Check machine data: %4</b>                                                      |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                             |
| <b>Explanation:</b> |                                                                                                             |
| <b>Remedy:</b>      | The machine data must be checked. Adapt the setting of the machine data.                                    |
| <b>61167</b>        | <b>[Channel %1: ] Block %2: Transformation not set up or not active: %4</b>                                 |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                             |
| <b>Explanation:</b> |                                                                                                             |
| <b>Remedy:</b>      | The specified transformation is not set up or not active. Set up or activate the transformation.            |
| <b>61168</b>        | <b>[Channel %1: ] Block %2: Incorrect machining plane: %4</b>                                               |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                             |
| <b>Explanation:</b> |                                                                                                             |
| <b>Remedy:</b>      | The machining plane is incorrect. Program correct machining plane.                                          |
| <b>61169</b>        | <b>[Channel %1: ] Block %2: Spindle incorrectly programmed</b>                                              |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                             |
| <b>Explanation:</b> | An incorrect spindle was programmed.                                                                        |
| <b>Remedy:</b>      | Change the spindle selection.                                                                               |
| <b>61170</b>        | <b>[Channel %1: ] Block %2: Incorrect block plane (%4)</b>                                                  |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                             |
| <b>Explanation:</b> | An invalid block plane was used.                                                                            |
| <b>Remedy:</b>      | Use a valid block plane.<br>It is only permissible that the block planes are used in an ascending sequence. |
| <b>61171</b>        | <b>[Channel %1: ] Block %2: Block plane used twice (%4)</b>                                                 |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                             |
| <b>Explanation:</b> | The same block plane was used twice.                                                                        |
| <b>Remedy:</b>      | Only nest the block planes in an ascending sequence.                                                        |

---

**61172 [Channel %1: ] Block %2: Spindle groups must not be nested**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** You have used spindles in several nested groups.

**Remedy:** Only use one spindle in one group plane with nested groups.

---

**61173 [Channel %1: ] Block %2: Supplementary run-in code only possible with spindle**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The supplementary run-in code can only be used in one block with spindle.

**Remedy:** Use a block with spindle.

---

**61174 [Channel %1: ] Block %2: Not possible to align milling tool with active turning tool**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** It is not possible to align milling tools with an active turning tool.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Load a milling tool before you call alignment.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61175 [Channel %1: ] Block %2: angle of aperture programmed too small**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The angle of aperture of the text (\_DF) in the engraving cycle is too small. This means that the text for engraving does not fit in the specified angle.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter a larger angle of aperture.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61176 [Channel %1: ] Block %2: text length programmed too small**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The text length (\_DF) in the engraving cycle is too short. This means that the text for engraving is longer than the specified text length.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter longer text length

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61177 [Channel %1: ] Block %2: polar text length > 360 degrees**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** In the engraving cycle, the polar text length must not exceed 360 degrees.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter shorter text length.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61178 [Channel %1: ] Block %2: code page not present**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The specified code page is not supported by the cycle.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Use code page 1252.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61179 [Channel %1: ] Block %2: character does not exist, no.: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label  
%4 = Character number

**Explanation:** The character entered in the text for engraving cannot be milled.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter another character.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61180 [Channel %1: ] Block %2: No name assigned to swivel data record**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Although there are several swivel data blocks, no unique names have been assigned.

**Remedy:** A unique name must be assigned to the swivel data block (\$TC\_CARR34[n]) if machine data 18088 \$MN\_MM\_NUM\_TOOL\_CARRIER is > 1.

---

**61181 [Channel %1: ] Block %2: NCK software version is insufficient for the Swivel function**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Swivelling is not possible with the current NCK software version.

**Remedy:** Upgrade NCK software to NCK 75.00 or higher.

---

---

**61182 [Channel %1: ] Block %2: Name of swivel data record unknown: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The specified name of the swivel data block is unknown.

**Remedy:** Check name of swivel data record \$TC\_CARR34[n].

---

**61183 [Channel %1: ] Block %2: Swivel CYCLE800: Retraction mode parameter lies outside value range: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The value of the retraction mode parameter (\_FR) lies outside the valid range.

**Remedy:** Swivel CYCLE800: Check transfer parameter \_FR. Value range 0 to 8

---

**61184 [Channel %1: ] Block %2: No solution possible with current input angle values**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The surface defined via the input angle cannot be processed with the machine.

**Remedy:** -Check the angles entered for swiveling the machining plane: %4  
-Parameter \_MODE coding incorrect, e.g. rotation axis-wise YXY

---

**61185 [Channel %1: ] Block %2: Invalid angular ranges of rotary axes in swivel data record: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The angular range of the rotary axes is invalid.  
Check setup of the swivel CYCLE800.

Parameter \$TC\_CARR30[n] to \$TC\_CARR33[n] n number of swivel data record

Example: Rotary axis 1 modulo 360 degrees: -> \$TC\_CARR30[n]=0 \$TC\_CARR32[n]=360

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check setup of swivel cycle CYCLE800.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61186 [Channel %1: ] Block %2: Invalid rotary axis vectors --> Check setup of the swivel cycle CYCLE800.**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** No or incorrect entry for rotary axis vector V1 or V2.

**Remedy:** Check commissioning of swivel CYCLE800

Check rotary axis vector V1xyz: \$TC\_CARR7[n], \$TC\_CARR8[n], \$TC\_CARR9[n]

Check rotary axis vector V2xyz: \$TC\_CARR10[n], \$TC\_CARR11[n], \$TC\_CARR12[n]

If 2nd rotary axis not available (\$TC\_CARR35[n]=""), then it is possible that V2xyz=0

n Number of the swivel data set

---

**61187 [Channel %1: ] Block %2: Check setup of the swivel cycle CYCLE800. - Error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:****Reaction:**

Interpreter stop

NC Start disable in this channel.

Interface signals are set.

Alarm display.

**Remedy:**

Error code: See current cycles software version notes in siemens.txt

**Programm**

Clear alarm with the RESET key. Restart part program

**continuation:**

---

**61188 [Channel %1: ] Block %2: No axis name agreed for rotary axis 1 -> Check setup of the swivel cycle CYCLE800.****Parameters:**

%1 = Channel number

%2 = Block number, label

**Explanation:**

No axis name was specified for the rotary axis 1.

**Remedy:**

Check setup of swivel CYCLE800.

Axis name of rotary axis 1 see parameter \$TC\_CARR35[n] n number of swivel data record

---

**61189 [Channel %1: ] Block %2: Swivel direct: Invalid rotary axis positions: %4****Parameters:**

%1 = Channel number

%2 = Block number, label

**Explanation:**

Swivel direct: Check input values of rotary axes.

**Remedy:**

Swivel mode direct: check the input values of the rotary axes or setup of swivel CYCLE800.

Check angular range of rotary axes in swivel data record n:

Rotary axis 1: \$TC\_CARR30[n], \$TC\_CARR32[n]

Rotary axis 2: \$TC\_CARR31[n], \$TC\_CARR33[n]

If values are entered in the work offset (WO) of the rotary axes, and machine data MD21186=0:

Value in WO of the rotary axis does not correspond to the angular range, rotary axis 1 or 2

Value in WO of the rotary axis plus input value does not correspond to the angular range, rotary axis 1 or 2

Note: for modulo axes, for swivel direct, the input value is calculated in the modulo range

Example: angular range, rotary axis modulo 0 up to 360: input value =-21, rotary axis moves to 339 degrees

---

**61190 [Channel %1: ] Block %2: Unable to retract prior to swiveling -> Error code: %4****Parameters:**

%1 = Channel number

%2 = Block number, label

**Explanation:**

**Remedy:** If tool carrier is active, check setup of swivel CYCLE800. Parameter \$TC\_CARR37[n] 7th and 8th decimal places  
n number of swivel data set  
If align turning tool with milling/turning machine (transformation on basic kinematic chain) is active,  
check parameter \$NT\_IDENT[n,0] 7th and 8th decimal places (n = name of transformation)  
Error code:  
A: Retraction Z not set up  
B: Retraction Z XY not set up  
C: Retraction in tool direction max. not set up  
D: Retraction in tool direction incremental not set up  
E: Retraction in tool direction: NC function CALCPOSI reports error  
For the CALCPOSI function, the axes must be referenced. Check machine data 20700 \$MC\_REFP\_NC\_START\_LOCK.  
F: Retraction in tool direction: no tool axis available  
Missing geometry axis (tool axis) Z with G17, Y with G18 or X with G19  
G: Retraction in tool direction max.: negative retraction path  
H: Retraction in tool direction incremental: negative retraction path not permitted  
I: Retraction setup of swivel CYCLE800 not set up  
J: Retraction in tool direction is not permitted, because current Work (WCS) is mirrored  
Tool carrier is active  
K: Retraction and swivel plane and transformation on basic kinematic chain are active  
Retraction with transformation only if align turning tool is active  
L: Retraction in tool direction and align tool are only permitted if setting data 42954 \$SC\_TOOL\_ORI\_CONST\_M=0  
Transformation on basic kinematic chain is active  
M: Retraction in tool direction and align tool are only permitted if setting data 42956 \$SC\_TOOL\_ORI\_CONST\_T=0  
Transformation on basic kinematic chain is active  
N: Retraction in tool direction and swivel plane toward counterspindle are not possible  
Turning machine with active tool carrier and initial setting -X (see swivel setup)  
O: Retraction in tool direction, align tool with counterspindle is not possible  
P: Retraction in tool direction in G18 toward counterspindle is not possible  
Q: Retraction in tool direction is not permitted because the current Work (WCS) is mirrored  
Align turning tool with milling/turning machine (transformation on basic kinematic chain) active  
R: Retraction in tool direction is not possible with align tool  
Align turning tool with milling/turning machine (transformation on basic kinematic chain) active

---

**61191 [Channel %1: ] Block %2: Multi-axis transformation not set up. Error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Error code:  
Number or parameter name of multi-axis transformation

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61192 [Channel %1: ] Block %2: Additional multi-axis transformations not set up. Error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

---

**61206 [Channel %1: ] Block %2: Synchronizing possible only when using a job list**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | Synchronizing with a counterspindle step in another channel is possible only if a job list is used.   |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Create job list and add programs for the individual channels.                                         |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61207 [Channel %1: ] Block %2: No counterspindle step found for synchronizing**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | No counterspindle step was found in any channel with which this channel could synchronize.            |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Control program.<br>Delete step for synchronizing if it is not required.                              |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61208 [Channel %1: ] Block %2: Assign parameters for main spindle chuck in the spindle chuck data**

|                               |                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                          |
| <b>Explanation:</b>           | The parameters for the main spindle chuck in the spindle chuck data are not assigned.                    |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.    |
| <b>Remedy:</b>                | Indicate parameters ZCn, ZSn and ZEn in the screen "Parameters" > "Setting data" > "Spindle chuck data". |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                     |

---

**61209 [channel %1: ] block %2: counterspindle step programmed in several channels**

|                     |                                                            |
|---------------------|------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label            |
| <b>Explanation:</b> | Counterspindle step may be programmed in one channel only. |

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | The step "Counterspindle: synchronizing" must be used in the other channels.                          |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61210 [Channel %1: ] Block %2: Block search element not found**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | The element specified for the block search does not exist.                                            |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Repeat block search.                                                                                  |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61211 [Channel %1: ] Block %2: Absolute reference missing**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | An incremental indication was made, but the absolute reference is unknown.                            |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Program an absolute position prior to using incremental indications.                                  |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61212 %[[Channel %1: ] Block %2: %]Wrong tool type**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | The tool type is not suitable for machining.                                                          |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Select a new tool type.                                                                               |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61213 [Channel %1: ] Block %2: Circle radius too small**

|                     |                                                       |
|---------------------|-------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label       |
| <b>Explanation:</b> | The programmed circle radius is too small.            |
| <b>Remedy:</b>      | Correct the circle radius, center point or end point. |

---

**61214 [Channel %1: ] Block %2: No pitch programmed**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** No thread/helical pitch has been entered.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Program a pitch.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61215 [Channel %1: ] Block %2: Unfinished dimension incorrectly programmed**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Check the blank spigot dimensions. The blank spigot must be larger than the production part spigot.

**Remedy:** Check parameters \_AP1 and \_AP2.

---

**61216 %[[Channel %1: ] Block %2: %]Feed/tooth only possible with cutting tools**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Feed per tooth is only possible with milling tools.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** As alternative, set a different feed type.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61217 [Channel %1: ] Block %2: Cutting speed programmed for tool radius 0**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** To be able to work with cutting speed, the tool radius has to be specified.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter a value for cutting speed.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61218 [Channel %1: ] Block %2: Feed/tooth programmed, but number of tools equals zero**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** For feed per tooth, the number of teeth has to be specified.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter the number of teeth on the milling tool in the "Tool list" menu.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61219 [Channel %1: ] Block %2: Tool radius too large**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The tool radius is too large for machining.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select a suitable tool.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61220 [Channel %1: ] Block %2: Tool radius too small**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The tool radius is too small for machining.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select a suitable tool.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61221 [Channel %1: ] Block %2: No tool active**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** No tool active.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select a suitable tool.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61222 [Channel %1: ] Block %2: Plane infeed greater than tool diameter**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The plane infeed must not be greater than the tool diameter.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Reduce plane infeed.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61223 [Channel %1: ] Block %2: Approach path too small**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The approach path must not be less than zero.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter a greater value for the approach path.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61224 [Channel %1: ] Block %2: Retract path too small**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The retract path must not be less than zero.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter a greater value for the retract path.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61225 [Channel %1: ] Block %2: Swivel data record unknown**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** An attempt was made to access a swivel data block which has not been defined.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select another swivel data block or define a new swivel data block.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61226 [Channel %1: ] Block %2: Swivel head cannot be exchanged**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The parameter "Swivel data block" is set to "No". In spite of this, an attempt has been made to change the swivel head.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Set the parameter "Swivel data block" in the setup screen "Rotary axes" to "Automatic" or "Manual".

**Programm continuation:** Clear alarm with the RESET key. Restart part program

|                               |                                                                                                                                                   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>61227</b>                  | <b>[Channel %1: ] Block %2: Target position cannot be reached: %4</b>                                                                             |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                   |
| <b>Explanation:</b>           | The target position of the approach motion is outside the software limit switch. This situation may arise from swiveling or coordinate rotations. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                             |
| <b>Remedy:</b>                | If possible, lower retraction plane. Select alternative solution for swiveling (direction +/-) or clamp on workpiece differently.                 |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                              |
| <b>61228</b>                  | <b>[Channel %1: ] Block %2: Retraction plane for swiveling with swivel head not reached due to software limit switches</b>                        |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                   |
| <b>Explanation:</b>           | Retraction plane not reached!                                                                                                                     |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                             |
| <b>Remedy:</b>                | Correct retraction plane                                                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                              |
| <b>61229</b>                  | <b>[Channel %1: ] Block %2: The external retraction plane must be greater than the internal retraction plane</b>                                  |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                   |
| <b>Explanation:</b>           | The external retraction plane must be greater than the internal retraction plane.                                                                 |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                             |
| <b>Remedy:</b>                | Correct the retraction planes.                                                                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                              |
| <b>61230</b>                  | <b>[Channel %1: ] Block %2: Tool probe diameter too small</b>                                                                                     |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                   |
| <b>Explanation:</b>           | The tool probe has not been calibrated correctly.                                                                                                 |
| <b>Remedy:</b>                | Check the following machine or setting data: 51780 \$MNS_J_MEA_T_PROBE_DIAM_RAD[n]                                                                |
| <b>61231</b>                  | <b>[Channel %1: ] Block %2: ShopMill program %4 not executable, as not tested by ShopMill</b>                                                     |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%4 = Program name                                                                              |
| <b>Explanation:</b>           | Before a ShopMill program can be executed, it has to be tested by ShopMill.                                                                       |

|                               |                                                                                                                 |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.           |
| <b>Remedy:</b>                | The program first has to be simulated in ShopMill or loaded into the operating mode "Machine auto" by ShopMill. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                            |

---

|                               |                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>61232</b>                  | <b>[Channel %1: ] Block %2: Impossible to load magazine tool</b>                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                  |
| <b>Explanation:</b>           | Only manual tools may be loaded into a swivel head in which only manual tools can be loaded.                                     |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                            |
| <b>Remedy:</b>                | Load a manual tool into the swivel head or set the parameter "Tool change" on the setup screenform "Rotary axes" to "Automatic". |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                             |

---

|                               |                                                                                                       |

| <b>Remedy:</b>                | Simulate the subroutine first in ShopTurn or load it into the ShopTurn operating mode "Machine auto". |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

#### **61237 [Channel %1: ] Block %2: Retraction direction unknown. Withdraw tool manually!**

|                               |                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                           |
| <b>Explanation:</b>           | The tool is in the retraction area and it is unknown in which direction it can be travelled out of it.    |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.     |
| <b>Remedy:</b>                | Manually retract the tool from the retraction area defined in the program header and restart the program. |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                      |

---

#### **61238 [Channel %1: ] Block %2: Machining direction unknown!**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | The direction of the next machining is unknown.                                                       |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Please contact the responsible Siemens regional office.                                               |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

#### **61239 [Channel %1: ] Block %2: Tool change point lies within retraction area!**

|                    |                                                 |
|--------------------|-------------------------------------------------|
| <b>Parameters:</b> | %1 = Channel number<br>%2 = Block number, label |
|--------------------|-------------------------------------------------|

|                               |                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | The tool change point has to be far enough outside the retraction area so that no tool extends into the retraction area when the turret is swiveled. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                |
| <b>Remedy:</b>                | Specify another tool change point.                                                                                                                   |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                 |

---

#### **61240      %[[Channel %1: ] Block %2: %]Wrong feed type**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | The feed type is not possible for this machining.                                                     |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Check feed type                                                                                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

#### **61241      [Channel %1: ] Block %2: Retraction plane not defined for this machining direction**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | No retraction plane has been defined for the selected machining direction.                            |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Define the missing retraction plane.                                                                  |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

#### **61242      [Channel %1: ] Block %2: Wrong machine direction**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | The machining direction has been specified incorrectly.                                               |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Check the programmed machining direction.                                                             |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

#### **61243      [Channel %1: ] Block %2: Correct tool change point, tool tip in retraction area!**

|                     |                                                                                                                                                 |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                 |
| <b>Explanation:</b> | The tool change point must be situated so far outside the retraction area that no tool protrudes into the retraction area on turret swivelling. |

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Specify another tool change point.                                                                    |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61244 [Channel %1: ] Block %2: Pitch change leads to undefined thread**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | The specified pitch change causes a reversal of the thread direction.                                 |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Check thread pitch change and thread geometry.                                                        |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61245 [Channel %1: ] Block %2: Machining plane does not match modal machining plane**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | Machining plane does not match modal one.                                                             |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Check the machining plane.                                                                            |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61246 [Channel %1: ] Block %2: Safety distance too small**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | The safety clearance is too small for machining.                                                      |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Increase safety clearance.                                                                            |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61247 [Channel %1: ] Block %2: Blank radius too small**

|                     |                                                 |
|---------------------|-------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label |
| <b>Explanation:</b> | The blank radius is too small for machining.    |

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Increase blank radius.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61248 [Channel %1: ] Block %2: Infeed too small**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The infeed is too small for machining.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Increase infeed.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61249 [Channel %1: ] Block %2: Number of edges too small**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The number of edges is too small.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Increase number of edges.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61250 [Channel %1: ] Block %2: Width across flats/edge length too small**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The width across flats/edge length is too small.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Increase key width/edge length.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61251 [Channel %1: ] Block %2: Width across flats/edge length too large**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The width across flats/edge length is too large.

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Decrease key width/edge length.                                                                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61252 [Channel %1: ] Block %2: Chamfer/radius too large**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | Chamfer/radius is too large.                                                                          |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Decrease chamfer/radius.                                                                              |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61253 [Channel %1: ] Block %2: No finishing allowance programmed**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | No finishing allowance has been entered.                                                              |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Program a finishing allowance.                                                                        |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61254 [Channel %1: ] Block %2: Error while traveling to fixed stop**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | Error on travelling to fixed stop.                                                                    |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | specify another Z1 position for gripping the counterspindle.                                          |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61255 [Channel %1: ] Block %2: Error during cut-off: Tool broken?**

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                      |
| <b>Explanation:</b> | Cut-off could not be completed. A tool breakage might have occurred. |

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Check the tool.                                                                                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61256 [Channel %1: ] Block %2: Mirroring not allowed at program start. Deselect work offset!**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | Mirroring impermissible at program start.                                                             |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Deselect work offset.                                                                                 |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61257 [Channel %1: ] Block %2: incomplete setup of counterspindle**

|                               |                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                     |
| <b>Explanation:</b>           | Setup of the counterspindle is incomplete.                                                                                                                                                                                                                          |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                               |
| <b>Remedy:</b>                | The following machine and setting data must be set for the counterspindle:<br>MD 52206 \$MCS_AXIS_USAGE<br>SD 55232 \$SCS_SUB_SPINDLE_REL_POS<br>SD 55550 \$SCS_TURN_FIXED_STOP_DIST<br>SD 55551 \$SCS_TURN_FIXED_STOP_FEED<br>SD 55552 \$SCS_TURN_FIXED_STOP_FORCE |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                |

---

**61258 [Channel %1: ] Block %2: Assign parameters for counterspindle chuck in the spindle chuck data**

|                               |                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                          |
| <b>Explanation:</b>           | The parameters for the counterspindle chuck in the spindle chuck data have not been assigned.            |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.    |
| <b>Remedy:</b>                | Indicate parameters ZCn, ZSn and ZEn in the screen "Parameters" > "Setting data" > "Spindle chuck data". |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                     |

---

**61259 [Channel %1: ] Block %2: program contains new machining steps from ShopMill %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %4 = ShopMill version

**Explanation:** The program has been created with a ShopMill version that is higher than the existing one.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Delete the machining step and reprogram machining if required.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61260 [Channel %1: ] Block %2: program contains new machining steps from ShopTurn %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label  
 %4 = ShopTurn version

**Explanation:** The program has been created with a ShopTurn version that is higher than the existing one.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Delete the machining step and reprogram machining if required.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61261 [Channel %1: ] Block %2: center offset too large**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The center offset on center drilling is larger than permissible.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Enter lower eccentricity (\$SCS\_DRILL\_MID\_MAX\_ECCENT).

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61262 [Channel %1: ] Block %2: pitch not possible with selected tool**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The pitch of the tap does not match the programmed pitch.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Use a tap with the programmed pitch.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

|                               |                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>61263</b>                  | <b>[Channel %1: ] Block %2: Chained ShopMill program blocks not permissible in subprogram on pos. pattern</b> |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                               |
| <b>Explanation:</b>           | If a subroutine is called from a position pattern, the subroutine itself must not include a position pattern. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.         |
| <b>Remedy:</b>                | Reprogram machining.                                                                                          |

| <b>Explanation:</b>           | If a subroutine is called from a position pattern, the subroutine itself must not include a position pattern. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.         |
| <b>Remedy:</b>                | Reprogram machining.                                                                                          |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                          |
| <hr/>                         |                                                                                                               |
| <b>61265</b>                  | <b>[Channel %1: ] Block %2: Too many restrictions, use rectangular pocket</b>                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                               |
| <b>Explanation:</b>           | In face milling a maximum of only 3 sides can be delimited.                                                   |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.         |
| <b>Remedy:</b>                | Use pocket cycle.                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                          |
| <hr/>                         |                                                                                                               |
| <b>61266</b>                  | <b>[Channel %1: ] Block %2: Illegal machining direction</b>                                                   |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                               |
| <b>Explanation:</b>           | In face milling, the delimitations and the direction of machining do not match.                               |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.         |
| <b>Remedy:</b>                | Select another direction of machining.                                                                        |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                          |

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>61267</b>                  | <b>[Channel %1: ] Block %2: Plane infeed too large, residual corners remain</b>                       |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | In face milling, the plane infeed must not exceed 85%.                                                |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Select a smaller plane infeed, as otherwise residual corners will be left over.                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |
| <b>61268</b>                  | <b>[Channel %1: ] Block %2: Illegal machining direction, residual corners are left over.</b>          |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | In face milling, the machining direction does not match the selected delimitations.                   |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | The machining direction must be selected to match the delimitations.                                  |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |
| <b>61269</b>                  | <b>[Channel %1: ] Block %2: External tool diameter too small</b>                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | Incorrect tool definition.                                                                            |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Check angle and diameter of the tool used.                                                            |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |
| <b>61270</b>                  | <b>%[[Channel %1: ] Block %2: %]Chamfer width too small</b>                                           |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | Chamfer width selected too small.                                                                     |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Increase the chamfer width.                                                                           |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61271      %[[Channel %1: ] Block %2: %]Chamfer width greater than tool radius**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**      Chamfer width larger than tool radius.

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            Use a larger tool.

**Programm  
continuation:**      Clear alarm with the RESET key. Restart part program

---

**61272      %[[Channel %1: ] Block %2: %]Insertion depth too small**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**      Insertion depth on chamfering too small.

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            Increase the insertion depth.

**Programm  
continuation:**      Clear alarm with the RESET key. Restart part program

---

**61273      %[[Channel %1: ] Block %2: %]Insertion depth too large**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**      Insertion depth on chamfering too large.

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            Decrease the insertion depth.

**Programm  
continuation:**      Clear alarm with the RESET key. Restart part program

---

**61274      %[[Channel %1: ] Block %2: %]Invalid tool angle**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**      Invalid tool angle.

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            Check tool angle

**Programm  
continuation:**      Clear alarm with the RESET key. Restart part program

---

---

**61275 [Channel %1: ] Block %2: Target point violates software limit switch!**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Due to a swivel action, the end point is outside the software limit switches.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select another retraction plane or approach a suitable interpolation point.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61276 [Channel %1: ] Block %2: External tool diameter required for restrictions**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Outer tool diameter required in case of delimitations.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Specify the outer tool diameter.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61277 [Channel %1: ] Block %2: Tool diameter larger than restriction**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Tool diameter larger than delimitation.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Use a smaller tool.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61278 [Channel %1: ] Block %2: If tool angle is larger than 90°, both tool diameters must be equal**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** For tool angles larger than 90°, the two tool diameters must be identical.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the tool angle or the tool diameters.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61279 [Channel %1: ] Block %2: If tool angle equals 90°, both tool diameters must be equal**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** For tool angles equal to 90°, the two tool diameters must be identical.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the tool angle or the tool diameters.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61280 [Channel %1: ] Block %2: %4- Mirroring missing in work offset for counterspindle**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The work offset for counterspindle machining does not have Z mirroring.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select Z mirroring for the work offset used.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61281 [Channel %1: ] Block %2: starting point of machining outside retraction planes**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The starting point of machining is outside the retraction planes.  
It is derived from the programmed geometry plus the safety distance in the selected machining direction.  
The calculated point must lie within the retraction area to ensure safe approach.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Adjust the retraction planes.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61282 [Channel %1: ] Block %2: end point of machining outside retraction planes**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The end point of machining is outside the retraction planes.  
It is calculated internally (according to the selected machining strategy).

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Adjust the retraction planes.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

|                               |                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>61283</b>                  | <b>[Channel %1: ] Block %2: direct approach not possible, as tool change required</b>                             |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                   |
| <b>Explanation:</b>           | After block search a position is to be reached by direct approach, but a tool change is required before.          |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.             |
| <b>Remedy:</b>                | First execute a manual tool change, then restart the block search.                                                |

| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61294 [Channel %1: ] Block %2: Active radius/diameter setting does not match reset setting**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Before starting up the program, set G group 29 (DIAMON, DIAMOF, etc.) to reflect the corresponding reset value.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61295 [Channel %1: ] Block %2: The value of the 'Axis sequence' parameter is illegal**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the "Axis sequence" parameter in the screenform

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61296 [Channel %1: ] Block %2: Blank programmed incorrectly**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The blank has been programmed incorrectly.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Correct the blank.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61297 [Channel %1: ] Block %2: Reference for incremental retraction plane missing**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The retraction plane can only be specified in increments if the blank is entered.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Program the retraction plane in absolute terms.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61298 [Channel %1: ] Block %2: No work offset entered for main spindle**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** No work offset has been specified for the main spindle.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Specify a work offset for the main spindle in the program header or under Settings.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61299 [Channel %1: ] Block %2: No work offset entered for counterspindle**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** No work offset has been entered for the counterspindle.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Specify a work offset for the counterspindle in the program header or under Settings.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61300 [Channel %1: ] Block %2: Probe defective**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61301 [Channel %1: ] Block %2: Probe not switching**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The measuring distance was completely traversed, but no switching signal was generated at the measuring input.

**Remedy:** -Check measuring input  
-Check measuring distance  
-Probe defective  
-If the measuring cycles are used with SinuTrain or an NCU with simulated axes, check the machine data 13231 \$MN\_MEAS\_PROBE\_OFFSET.  
MD13231 moves the MEAS switching position and must be less than the measuring distance parameterized in the current measuring cycle.

---

**61302 [Channel %1: ] Block %2: Probe - collision**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The measuring probe collided with an obstacle when being positioned.

**Remedy:**

- Check spigot diameter (may be too small)
- Check measuring distance (may be too long)

---

**61303 [Channel %1: ] Block %2: Safety margin exceeded %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The measuring result differs greatly from the specified value.

**Remedy:** Check setpoint value and parameter TSA.

---

**61304 [Channel %1: ] Block %2: Allowance**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

- The difference between actual and setpoint measurements is greater than the upper tolerance limit (screen parameter TUL):
- TUL is the upper tolerance limit of the measurement difference.
- TUL is always related to the material, irrespective of whether external or internal machining is involved.
- The hole/pocket is thus too small and the spigot is too large.
- This means that further material can be removed.
- The measuring cycle parameter TUL corresponds to "upper deviation", the usual term used in mechanical engineering for fits and tolerances.

**Reaction:**

- Interpreter stop
- NC Start disable in this channel.
- Interface signals are set.
- Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61305 [Channel %1: ] Block %2: Dimension too small**

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

- The difference between the actual and setpoint measurement is less than the lower tolerance limit (screen parameter TLL):
- TLL is the lower tolerance limit of the measurement difference.
- TLL is always related to the material, irrespective of whether external or internal machining is involved.
- The hole/pocket is thus too large and the spigot too small.
- This means that too much material has already been removed.
- The measuring cycle parameter TLL corresponds to "lower deviation", the usual term used in mechanical engineering for fits and tolerances.

**Reaction:**

- Interpreter stop
- NC Start disable in this channel.
- Interface signals are set.
- Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

| <b>61314</b>        | <b>[Channel %1: ] Block %2: Check selected tool type</b>                                                                                                                                                                                                                                                                                            |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                     |
| <b>Explanation:</b> |                                                                                                                                                                                                                                                                                                                                                     |
| <b>Remedy:</b>      | Measure workpiece:<br>- Specify new S_PRNUM or recalibrate probe<br>- Check whether the probe (type 7xx or 5xx) is suitable for the measuring task<br>Measure tool:<br>Tool type impermissible for calibration (adjustment) of the tool probe.                                                                                                      |
| <b>61315</b>        | <b>[Channel %1: ] Block %2: Check position of cutting edge</b>                                                                                                                                                                                                                                                                                      |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                     |
| <b>Explanation:</b> | When measuring the workpiece for the technology turning, cutting edge positions 7 and 8 are allowed for probe type 580.<br>Cutting edge positions 5 and 6 are also possible in special applications, such as measuring at the counterspindle.                                                                                                       |
| <b>Remedy:</b>      | When measuring the workpiece for the technology turning, check the cutting edge position of the probe in the tool list.<br>When measuring the tool for the technology turning with orientable toolholders, the active cutting edge position of the probe is evaluated.<br>In this case, the currently active cutting edge position must be checked. |
| <b>61316</b>        | <b>[Channel %1: ] Block %2: Center and radius cannot be determined</b>                                                                                                                                                                                                                                                                              |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                                                                                                                                     |
| <b>Explanation:</b> | No circle can be calculated from the measured points, as all measured points lie on a straight line.                                                                                                                                                                                                                                                |
| <b>Remedy:</b>      | Program change                                                                                                                                                                                                                                                                                                                                      |

---

**61317 [Channel %1: ] Block %2: Check number of circle calculation points**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Parameterization faulty. 3 or 4 points are required to calculate the center point.

**Remedy:** Change parameterization of CYCLE116.

---

**61318 [Channel %1: ] Block %2: Check weighting factor**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Remedy:** - Check parameter (FW)

---

**61319 [Channel %1: ] Block %2: Check call parameter CYCLE114**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Remedy:** Check call parameter CYCLE114.

---

**61320 [channel %1: ] block %2: check tool name / number**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Remedy:** - Check parameter S\_TNAME.  
With active tool management, parameter S\_TNAME is empty or the specified tool name is unknown to the tool management.

---

**61321 [Channel %1: ] Block %2: Check WO memory number**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The work offset to be corrected does not exist.  
Or a correction should be made to the coordinate rotation of a global work offset.  
Global work offsets have only linear offsets and no rotational offsets.  
It is therefore not possible to correct measured angles or other rotational offsets in them.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check the number of the work offset to be corrected that is specified in the measuring cycle mask.  
Check also the parameters S\_KNUM and S\_KNUM1 in the measuring cycle interface.

If the machine data 18601 \$MN\_MM\_NUM\_GLOBAL\_USER\_FRAMES is greater than zero, all work offsets are globally defined. In this case, no coordinate rotation can be corrected. If you want to correct a coordinate rotation, the machine data 18601 must be set to zero so that the work offsets are defined according to the specific channel.  
For this the machine data 18601 \$MN\_MM\_NUM\_GLOBAL\_USER\_FRAMES and 28080 \$MC\_MM\_NUM\_USER\_FRAMES must be checked

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61322 [Channel %1: ] Block %2: Check 4th digit of \_KNUM**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The stated digit of \_KNUM includes invalid values. Also check \_MVAR.

**Remedy:** Check parameter for the tool offset target (\_KNUM) and/or the measurement variant (S\_MVAR).

---

**61323 [Channel %1: ] Block %2: Check 5th digit of \_KNUM**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The stated digit of \_KNUM includes invalid values. Also check \_MVAR.

**Remedy:** Check parameter for the tool offset target (\_KNUM) and/or the measurement variant (S\_MVAR).

---

**61324 [Channel %1: ] Block %2: Check 6th digit of \_KNUM**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The stated digit of \_KNUM includes invalid values. Also check \_MVAR.

**Remedy:** Check parameter for the tool offset target (\_KNUM) and/or the measurement variant (S\_MVAR).

---

**61325 [Channel %1: ] Block %2: Check measuring axis/offset axis**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Remedy:** Check the parameter for the measuring axis (X, Y, Z).

---

**61326 [Channel %1: ] Block %2: Check measuring direction**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Remedy:** Milling measuring cycles:  
- Check the measuring direction (+/-) entered in the mask.  
Turning measuring cycles:  
- Check the current pre-positioning of the workpiece probe with reference to the entered inner or outer measurement (setpoint).

---

**61327 [Channel %1: ] Block %2: Program reset required**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** NC reset required.

**Remedy:** Execute NC reset.

---

**61328 [Channel %1: ] Block %2: Check D number**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The D number in parameter \_KNUM is larger than the maximum value in the machine data 18105 \$MN\_MM\_MAX\_CUTTING\_EDGE\_NO.

Only cutting edges 1 and 2 are permitted for the "simultaneous measurement" function.

**Remedy:** Check the parameter for the tool offset target (S\_KNUM1).

Check the value in the machine data 18105 \$MN\_MM\_MAX\_CUTTING\_EDGE\_NO.

---

---

**61336 [Channel %1: ] Block %2: Geometry axes do not exist**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** Not all the geometry axes required for measurement or machining are configured.

**Remedy:** Machine data 20060[0..2] \$MC\_AXCONF\_GEOAX\_NAME\_TAB must be checked and, if necessary, changed.

---

**61337 [Channel %1: ] Block %2: Check measuring input**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61338 [Channel %1: ] Block %2: Positioning speed equal to zero**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** In some measuring variants, e.g. measuring spigots (CYCLE977), intermediate paths are generated in addition to the actual measuring paths.  
These are traversed at a specific feed rate.  
The values for the feed rate can be found in the setting data 55634 \$SCS\_MEA\_FEED\_PLANE\_VALUE, 55636 \$SCS\_MEA\_FEED\_FEEDAX\_VALUE and 55640 \$SCS\_MEA\_FEED\_CIRCLE.

**Remedy:** Check the values for the feed rate in the setting data 55634 \$SCS\_MEA\_FEED\_PLANE\_VALUE, 55636 \$SCS\_MEA\_FEED\_FEEDAX\_VALUE and 55640 \$SCS\_MEA\_FEED\_CIRCLE.

---

**61339 [Channel %1: ] Block %2: Correction factor for rapid traverse speed = 0**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** The correction factor for rapid traverse speed is 0.

**Remedy:** Check setting data 55632 \$SCS\_MEA\_FEED\_RAPID\_IN\_PERCENT.

---

**61340 [Channel %1: ] Block %2: Incorrect alarm number**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Internal error in measuring cycles.

---

**61341 [Channel %1: ] Block %2: Probe not calibrated in active plane or wrong calibration data record**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** The probe is not calibrated in the active plane or an incorrect calibration data set has been selected.

**Remedy:** Calibrate the probe before measuring.  
Check the number of the probe calibration data field (calibration data record) in parameter S\_PRNUM.  
Note planes G17, G18 and G19. Only G18 is permitted for workpiece measurement when turning.  
Check: Setting data 54611 \$SNS\_MEA\_WP\_FEED[S\_PRNUM-1] > 0 after calibration

---

| <b>Explanation:</b>           | The distance between the starting point and the measuring point is less than or equal to 0.<br>The parameters X1 or X2 are not occupied or smaller than 0. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                      |
| <b>Remedy:</b>                | Check parameters X1 and X2.                                                                                                                                |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                       |
| <b>61347</b>                  | <b>[Channel %1: ] Block %2: Angle 1st edge - 2nd edge equals 0</b>                                                                                         |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label channel number                                                                                             |
| <b>Explanation:</b>           | The parameter following angle (alpha 1) is 0.                                                                                                              |
| <b>Remedy:</b>                | Check the parameter following angle (alpha 1).                                                                                                             |
| <b>61348</b>                  | <b>[Channel %1: ] Block %2: Angle rel. to reference edge equals 0</b>                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label channel number                                                                                             |
| <b>Explanation:</b>           |                                                                                                                                                            |

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61349 [Channel %1: ] Block %2: Distance upper probe edge - measuring position = 0 for tool radius measurement**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:** The distance between the upper edge and lower edge of the tool probe is 0. This is relevant for radius measurement.

**Remedy:** Check the setting data 54634 \$SNS\_MEA\_TP\_CAL\_MEASURE\_DEPTH.

---

**61350 [Channel %1: ] Block %2: Feed, speed not programmed for tool measurement with rotating spindle**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:** No feed rate or spindle speed is programmed for tool measurement with rotating spindle.

**Remedy:** Check parameters F1 and S1.

---

**61351 [Channel %1: ] Block %2: Tool length or radius is 0**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:** The active tool length or the active tool radius is 0.

**Remedy:** Cutter: - Check length and radius of the active tool in the compensation data memory  
 Drill: - Check length of the active tool in the compensation data memory  
 - Radius or tip angle of the active tool must be predefined in the compensation data memory

---

**61352 [Channel %1: ] Block %2: Path for logfile not permitted**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:** The specified path for the log file is incorrect.

**Remedy:** Check the programmed path specification.  
 Check parameter \_PROTNAME[0].

---

**61353 [Channel %1: ] Block %2: Path for logfile not found**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:** The specified directory does not exist or the specified path is incorrect.

**Remedy:** Check the programmed path specification.  
 Check parameter \_PROTNAME[0].

---

**61354 [Channel %1: ] Block %2: Log file not found**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:** No name specified for the log file.

**Remedy:** Check the programmed path specification.  
Check parameter \_PROTNAME[0].

---

#### **61355 [Channel %1: ] Block %2: Incorrect file type for logfile**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** The file extension for the log file is incorrect.  
The file extensions .txt and .csv are permitted.

**Remedy:** Check parameter \_PROTNAME[0].

---

#### **61356 [Channel %1: ] Block %2: Logfile is being used**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** The log file is already used by an NC program.

**Remedy:** Check parameter \_PROTNAME[1].

---

#### **61357 %[[Channel %1: ] Block %2: %] Not enough NC memory or too many files/directories in the NC**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** There is not enough NC memory available or there are too many files or directories in the NC file system.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Delete files whose names are comprised exclusively of numbers, e.g. "201202100938202\_MPF", in the directory /  
\_N\_WKS\_DIR/\_N\_TEMP\_WPD.  
Also check whether other files in this directory can be deleted.  
Check, and if required, increase machine data 18320: \$MN\_MM\_NUM\_FILES\_IN\_FILESYSTEM.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

#### **61358 [Channel %1: ] Block %2: Error during reporting: WRITE command %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** Internal error caused by the WRITE command.

**Remedy:** Causes of error codes:  
10 The file size specified in MD11420 \$MN\_LEN\_PROTOCOL\_FILE has been reached (file is full).  
Machine data MD11420 must be set to a value of at least 20 kB, and this sets the maximum size of the log file.  
- Increase the value in MD11420 or  
- Select log data "new" in cycle150 (data are overwritten) or  
- Delete log file or  
- Create new log file (change the name of the log file in CYCLE150)  
Error code 10 occurs only when logging in the passive file system of the NC.  
13 The protection level must be greater than or equal to the Write right of the stated log file.  
16 Check the path of the log file (invalid external path).  
Other errors: See Programming Guide: WRITE command  
Save measurement results:  
After eliminating the cause of the error, the associated log can be generated with the function "Report last measurement".

---

**61359 [Channel %1: ] Block %2: Error recording in table format: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** Internal error

**Remedy:** Call the hotline!

---

**61360 [Channel %1: ] Block %2: Error recording in JOG: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** Internal error

**Remedy:** Call the hotline!

---

**61361 [Channel %1: ] Block %2: Error reporting last measurement %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** Internal error

**Remedy:** Call the hotline!

---

**61362 [Channel %1: ] Block %2: Tolerance of the linear vector %4 exceeded**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** If the error comes from CYCLE996 or CYCLE9960:  
The tolerance of the linear vectors is exceeded during the measurement of the kinematics.  
The value of the tolerance is transferred in parameter TLIN.  
If TLIN=0 or tolerance (check) = no, the measured vectors are not monitored.

**Remedy:** A 2nd measurement with a larger tolerance can be made for the analysis. The kinematic data should not be overwritten.  
The newly measured vectors are documented in the measurement log (data file).

---

**61363 [Channel %1: ] Block %2: Tolerance of the rotary axis vector %4 exceeded**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** The rotary axis orientation is also calculated during kinematic measurement.  
If the deviation is negligible and only the tolerance range is too small, this can be changed in \$SN\_CORR\_TRAFO\_DIR\_MAX.  
A deviation of the rotary axis orientation can also have a mechanical cause.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** If the deviation is very large, the cause may be a small measuring circuit.  
With a rotary table, the calibration ball must not be too close to the center of rotation.  
With head kinematics, the measuring circuit can be enlarged by positioning the 2nd rotary axis when measuring the first.

---

**61364 [Channel %1: ] Block %2: Check distance between measuring points %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** In automatic mode, the Distance measuring points (\_ID) parameter must be checked.  
In JOG mode, the selected measuring points are congruent. The measuring points must be redefined.

---

| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label channel number                                                                                                                                                                                                                 |
| <b>Explanation:</b> | The traversing path would extend beyond the software end position on the current measuring axis.<br>The traversing path has currently been shortened, and does not reach the position specified as a setpoint.<br>Alarm 61401 is output after 5 unsuccessful contact attempts. |
| <b>Reaction:</b>    | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                          |
| <b>Remedy:</b>      | - Check setpoint value specification.<br>- Reduce the measuring distance (DFA).<br>- Place the workpiece further away from the software end position.                                                                                                                          |

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

#### **61402 [Channel %1: ] Block %2: Probe collision, path reduced by software end position %4**

**Parameters:** %1 = Channel number

%2 = Block number, label channel number

**Explanation:** This alarm is only output with external measurements (web, spigot, ball) in conjunction with a possible collision in the infeed axis.

The collision is caused by the reduction of the path in the measuring axis of the working plane, before lowering the infeed axis to the measuring height.

The probe was switched during the following infeed in the infeed axis.

If the path had not been reduced, the traversing movement would have extended beyond the software end position of the working plane, and the corresponding NCK alarm 10722 would have been triggered.

**Reaction:** Interpreter stop

NC Start disable in this channel.

Interface signals are set.

Alarm display.

**Remedy:** - Check setpoint value specification.

- Place the workpiece further away from the software limit position.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

#### **61403 [Channel %1: ] Block %2: Work offset correction not executed**

**Parameters:** %1 = Channel number

%2 = Block number, label channel number

**Explanation:**

**Remedy:** The measurement result contains more than one rotation component around the geometry axes of the coordinate system. However, only one of the rotation components of a rotary axis can be corrected.

To prevent any consequential position errors, the offset of the selected rotary axis is not performed.

"Correction into the coordinate system" must be selected as the bypass.

---

#### **61404 [Channel %1: ] Block %2: Tool correction not executed**

**Parameters:** %1 = Channel number

%2 = Block number, label channel number

**Explanation:** The offset of the selected tool could not be executed because of the current tool status.

The following applies to tools without a tool status:

- Must not be disabled, must have been active and in use.

The following applies to tools that form a tool grouping:

- Must not be disabled, must have been active and in use.

**Remedy:** Check the tool state and adapt accordingly.

---

#### **61405 [Channel %1: ] Block %2: Tool environment does not exist**

**Parameters:** %1 = Channel number

%2 = Block number, label channel number

**Explanation:**

**Remedy:** Correct the name of the tool environment (\_TENV) or create this environment.

---

#### **61406 [Channel %1: ] Block %2: Check DL number**

**Parameters:** %1 = Channel number

%2 = Block number, label channel number

**Explanation:**

**Remedy:** Check parameter DL.  
Check also the number of the sum and setup offset.

---

**61407 [Channel %1: ] Block %2: Check 7th digit and higher of \_KNUM**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** - Check parameter \_KNUM.  
- Check the the number of the sum offset and that of the setup offset.

---

**61408 [Channel %1: ] Block %2: total offsets not present**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Set MD 18080, Bit 8=1

---

**61409 [Channel %1: ] Block %2: set up offsets not present**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Set MD 18112, Bit 4=1

---

**61410 [Channel %1: ] Block %2 access to nonexistent tool element or property**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** The variable to be corrected requires an option or an increase in MD values.

---

**61411 [Channel %1: ] Block %2: Check the distribution of measuring points on the plane.**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Check the setpoint and actual values.

---

**61412 [Channel %1: ] Block %2: channel basic frame not present**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Set machine data 28081 \$MC\_MM\_NUM\_BASE\_FRAMES > 0 or check \$P\_CHBFRMASK > 0.

---

**61413 [Channel %1: ] Block %2: check setpoint of ball diameter, %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Check setpoint value for the spherical diameter.

|                     |                                                                                                                                                                                                                          |

| <b>Explanation:</b> | Setting in MD 51740 \$MNS_MEA_FUNCTION_MASK Bit 1 does not match calibration status in setting data 54610 \$SNS_MEA_WP_STATUS_GEN[S_PRNUM]. Check the THOUSANDS digit:<br>1 = circumference; 0 = TCP (Tool Center Point) |
| <b>Remedy:</b>      | Check machine data 51740 \$MNS_MEA_FUNCTION_MASK Bit 1<br>Remedy:<br>1. Recalibrate probe (adjust)<br>2. Change probe number S_PRNUM<br>3. Adjust MD51740 Bit 1                                                          |

---

**61420 [Channel %1: ] Block %2: Check calibration of multi/mono probes.****Parameters:** %1 = Channel number

%2 = Block number, label channel number

**Explanation:** The tool type does not match the alignment data set.**Remedy:** The workpiece probe must be calibrated according to its type and use.

---

**61421 [Channel %1: ] Block %2: Software release of measuring cycles or NCK inadequate or set up incorrectly - error code %4****Parameters:** %1 = Channel number

%2 = Block number, label channel number

**Explanation:****Remedy:** Causes of error: Error code see %4

A -&gt; \_OVR[] - parameter field too small. Check GUD definition.

B -&gt; \$SCS\_MEA\_KIN\_MODE? SD55645 not set up

---

**61422 [channel %1: ] block %2: parameter measuring variant incorrect - error code: %4****Parameters:** %1 = Channel number

%2 = Block number, label channel number

**Explanation:****Remedy:** Causes of error: See error code %4

A -&gt; CYCLE996 \_MVAR = 9x identifiers CYCLE996 measure kinematics or

A -&gt; CYCLE996 \_MVAR ONES digit outside the value range 0..4

B -&gt; CYCLE996 \_MVAR (parameter for normalization) HUNDRED THOUSANDS digit (dec6) or

B -&gt; CYCLE996 ONE MILLION digit(dec7) outside the value range 0..3

C -&gt; CYCLE996 Measurement version "compute kinematics" active, but rotary axes 1 and/or 2 not measured (see also parameter \_OVR[40])

or rotary axis 2 exists and no rotary axis vectors (V2xyz) are set up.

D -&gt; CYCLE996 \_MVAR TEN THOUSANDS digit (parameter rotary axis 1,2 or vector chain open, closed) outside the value range 0..3

1 -&gt; CYCLE9960 S\_MVAR ONES to TEN THOUSANDS digit outside the value range

2 -&gt; CYCLE9960 S\_MVAR TENS digit not compatible with the ONES DIGIT

3 -&gt; CYCLE9960 S\_MVAR TENS digit outside the value range 0,2

---

**61423 [Channel %1: ] Block %2: Parameter %4 not agreed or not created****Parameters:** %1 = Channel number

%2 = Block number, label channel number

**Explanation:****Remedy:** Causes of error: see error code %4

1 Parameter CYCLE996 S\_TC incorrect or equal zero

2 No swivel data set created -&gt; MD18088 \$MN\_MM\_NUM\_TOOL\_CARRIER = 0

3 \$NT\_NAME? -&gt; CYCLE996 System variable \$NT\_NAME not present

4 TRAFO NO=0? -&gt; CYCLE996 Trafo number = 0?

5 TRAFO TYP? -&gt; CYCLE996 Transformation type not equal to 24, 40 or 56

6 S\_MVAR? -&gt; CYCLE996 Trafo type OK, but incorrect call from CYCLE9960

4 -&gt; CYCLE9960 compile cycle E996 not set up

---

**61424 [Channel %1: ] Block %2: Parameter %4 for diameter of calibration ball incorrect****Parameters:** %1 = Channel number

%2 = Block number, label channel number

**Explanation:**

**Remedy:** Check whether the correct diameter of the calibration ball is entered in parameter S\_SETV, or the correct probe ball radius is entered in the tool data of the current workpiece probe.

The mechanical deviation of the position of the current workpiece probe must be minimized by presetting.

---

**61425 [Channel %1: ] Block %2: Parameter for measuring axis rotary axis 1 or 2 incorrect - Error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Causes of error: see error code %4

- A -> Rotary axis number incorrect (1 or 2)
- B -> No name agreed for rotary axis 1
- C -> Rotary axis vector V1xyz equals zero
- D -> No name agreed for rotary axis 2
- E -> Rotary axis vector V2xyz equals zero
- F VECTOR=0? -> CYCLE996 Orientation vector of the 1st rotary axis = 0
- G VECTOR=0? -> CYCLE996 Orientation vector of the 2nd rotary axis = 0
- 1 -> CYCLE9960 Incorrect number of measurements
- 2 -> CYCLE9960 Number of measurements incorrect: maximum 12 per axis
- 3 -> CYCLE9960 Number of measurements incorrect: minimum 3 per axis
- 4(RA1) -> CYCLE9960 Measuring range rotary axis 1 too small
- 4(RA2) -> CYCLE9960 Measuring range rotary axis 2 too small
- 5(RA1) -> CYCLE9960 Measuring range rotary axis1 too large
- 5(RA2) -> CYCLE9960 Measuring range rotary axis 2 too large
- 6 -> CYCLE9960 Number of measurements incorrect, min. per axis 2 for interpolation points
- 7 -> CYCLE9960 Modulo range: Measuring range covers the complete modulo range (360°), and therefore must begin at the starting position of the modulo range (usually 0)

The permissible measuring range of a rotary axis is from 10 to 360 degrees

---

**61426 [Channel %1: ] Block %2: Sum of the active offsets does not equal zero - Error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Causes of error: See error code %4

Check the overview of active offsets (\$P\_ACTFRAME)

Delete offsets in the rotary axes

- A -> sum of the translatory offsets of geometry axes <> 0
- B -> sum of the fine offsets of the geometry axes <> 0
- C -> sum of the rotary components of the geometry axes <> 0
- D -> sum of the translatory offsets of rotary axis 1 <> 0
- E -> sum of the translatory offsets of rotary axis 2 <> 0

---

**61427 [Channel %1: ] Block %2: Tool data of the active workpiece probe incorrect or inactive - Error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Causes of error: See error code %4

- A -> Workpiece probe (or tool edge) inactive
- B -> Length L1 of the workpiece probe = 0

---

**61428 [Channel %1: ] Block %2: Error while creating log file - Error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Causes of error: See error code %4  
A -> Number of log files in the current directory > 99  
B -> Log files too long. Rename or delete log files,  
check MD11420 \$MN\_LEN\_PROTOCOL\_FILE!

---

**61429 [Channel %1: ] Block %2: Measuring axis (rotary axis 1 or 2) not in basic or intended position - Error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Error causes: See Error code %4  
A -> Rotary axis 1 not in basic position for 1st measurement  
B -> Rotary axis 2 not in basic position for 1st measurement  
C -> Rotary axis 2 not rotated for the 2nd or 3rd measurement with reference to the 1st measurement -> see parameter \_OVR[63 to 65]  
D -> Rotary axis 1 not rotated for the 2nd or 3rd measurement with reference to the 1st measurement -> see parameter \_OVR[60 to 62]  
1 (RA1) -> CYCLE9960 Rotary axis 1 initially not in basic position  
2 (AMODE DEC5) -> Selected basic position is not permissible

---

**61430 [Channel %1: ] Block %2: Kinematic vectors not computed - Error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Explanation:</b> | The cutting edge position of the turning tool (cutting edge plate) is no longer in the machining plane (interpolation plane), e.g. caused by an orientable tool carrier.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Remedy:</b>      | Check the tool carrier position and, if necessary, correct it!                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>61442</b>        | <b>[Channel %1: ] Block %2: Tool carrier not parallel to the geometry axes</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label channel number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Explanation:</b> | After positioning the orientable tool carrier, the tool lengths L1, L2 and L3 are not parallel to the geometry axes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Remedy:</b>      | Check the positioning behavior of the rotary axes (e.g. blocking) of the tool carrier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**61505 [Channel %1: ] Block %2: retraction path is smaller than 1mm**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Increase retraction path

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61506 [Channel %1: ] Block %2: infeed path is smaller than 1mm**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Increase infeed path

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61507 [Channel %1: ] Block %2: safety clearance is smaller than 1mm**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61508 [Channel %1: ] Block %2: Incorrect default setting for shoulder position**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61509 [Channel %1: ] Block %2: Incorrect default setting for dresser position**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61510 [Channel %1: ] Block %2: Test run feed is active**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Switch off test run feed

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61531 [Channel %1: ] Block %2: Longitudinal position not registered in Z**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Increase infeed path parameter

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61532 [Channel %1: ] Block %2: Value for \_LAGE is incorrect**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Correct parameter content for \_LAGE

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61533 [Channel %1: ] Block %2: No length L1 entered under D...**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Enter length L1 in the tool offset D of the grinding wheel

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61540 [Channel %1: ] Block %2: Incorrect D number / dresser D field active**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** A tool D number must be programmed that is < \_GC\_DNUM

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61541 [Channel %1: ] Block %2: Incorrect grinding wheel type entered**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Select a valid grinding wheel type in tool management

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61542 [Channel %1: ] Block %2: Incorrect grinding wheel reference point selected when selecting the dresser coordinate system**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** A tool D number must be programmed that is < \_GC\_DNUM

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61549 [Channel %1: ] Block %2: Incorrect dresser type selected**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Remedy:** Check dresser type on input

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61550 [Channel %1: ] Block %2: Swiveling of plane not possible with active grinding tool**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Swiveling of the plane is not possible with an active grinding tool.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Load a milling tool before you swivel the plane.  
The alarm can be suppressed using SD 55410 \$SCS\_MILL\_SWIVEL\_ALARM\_MASK.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61551 [Channel %1: ] Block %2: Setting of milling tool not possible with active grinding tool**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Setting of milling tools is not possible with an active grinding tool.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Load a milling tool, before you call positioning.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61552 [Channel %1: ] Block %2: Alignment of milling tool not possible with active grinding tool**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Alignment of milling tools is not possible with an active grinding tool.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Load a milling tool before you call alignment.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61553 [Channel %1: ] Block %2: Alignment of grinding tool only possible with active grinding tool**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Alignment of grinding tools is only possible with an active grinding tool.

---

**61578 [Channel %1: ] Block %2: B axis kinematics (grinding technology) either not started up or started up incorrectly in swivel cycle - error code: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Remedy:** Causes of error:  
1. Error code = B789 -> B axis in start-up of swivel cycle (kinematics) not activated  
(789 corresponds to \$TC\_CARR7[n], n ... number of the swivel data record)

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61601 [Channel %1: ] Block %2: Finished part diameter too small**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Remedy:** Check parameter SPD or DIATH.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61602 [Channel %1: ] Block %2: Tool width incorrectly defined**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Plunge cutter is larger than the programmed groove width.

**Remedy:** Check tool or change program.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61603 [Channel %1: ] Block %2: Recess type incorrectly defined**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Radii/chamfers at the groove base do not match the groove width. Face groove on a contour element running parallel to the longitudinal axis is not possible.

**Remedy:** Check parameter VARI.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61604 [Channel %1: ] Block %2: Active tool violates programmed contour**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Contour violation in the relief cut elements due to the tool clearance angle of the tool used.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Use a different tool or check the contour subroutine.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

| <b>Explanation:</b>           | Illegal relief cut element detected.                                                                                                  |
| <b>Remedy:</b>                | Check contour program.                                                                                                                |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                  |
| <b>61606</b>                  | <b>[Channel %1: ] Block %2: Error during contour preparation</b>                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                       |
| <b>Explanation:</b>           | An error has been found on conditioning the contour. This alarm is always related to one of NCK alarms 10930...10934, 15800 or 15810. |
| <b>Remedy:</b>                | Check contour subroutine.                                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                  |
| <b>61607</b>                  | <b>[Channel %1: ] Block %2: Starting point incorrectly programmed</b>                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                       |
| <b>Explanation:</b>           | The starting point reached before the cycle call does not lie outside the rectangle described by the contour subroutine.              |
| <b>Remedy:</b>                | Check starting point prior to cycle call.                                                                                             |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                  |
| <b>61608</b>                  | <b>[Channel %1: ] Block %2: Incorrect tool point direction programmed</b>                                                             |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                       |
| <b>Explanation:</b>           |                                                                                                                                       |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                 |
| <b>Remedy:</b>                | A cutting edge position 1...4, matching the undercut form, must be programmed.                                                        |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                  |
| <b>61609</b>                  | <b>[Channel %1: ] Block %2: Shape incorrectly defined</b>                                                                             |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                       |
| <b>Explanation:</b>           |                                                                                                                                       |
| <b>Remedy:</b>                | Check parameter for the undercut form or groove form or pocket.                                                                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                  |
| <b>61610</b>                  | <b>[Channel %1: ] Block %2: No infeed depth programmed</b>                                                                            |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                       |
| <b>Explanation:</b>           |                                                                                                                                       |
| <b>Remedy:</b>                | Check parameter MID.                                                                                                                  |

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61611 [Channel %1: ] Block %2: No point of intersection found**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** No intersection could be calculated with the contour.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check contour programming or modify infeed depth.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61612 [Channel %1: ] Block %2: Synchronized thread machining not possible**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Remedy:** Check the preconditions for synchronized thread machining:  
- It is not permissible that a toolholder is active.  
- It is not permissible that transformation is active.  
- It is not permissible that rotation is active.  
If required, deselect thread synchronization.

---

**61613 [Channel %1: ] Block %2: Undercut position incorrectly defined**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check value in parameter \_VARI.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61614 [Channel %1: ] Block %2: %4 mirroring in work offset for main spindle not permitted**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The work offset for main spindle machining must not have mirroring in the specified axis.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Deselect mirroring in the specified axis in the work offset used.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61615 [Channel %1: ] Block %2: %4 mirroring in the work offset is not permitted for the counterspindle**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The work offset for counterspindle machining must not have any Z mirroring.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Deselect Z mirroring in the WO used.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61616 [Channel %1: ] Block %2: Current cutting edge position %4 impermissible**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Cutting edge positions 1 to 4 are permissible for corner stock removal.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61617 [Channel %1: ] Block %2: Maximum spindle speed for the main spindle not entered**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The maximum spindle speed for the main spindle was not entered.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Enter the maximum spindle speed for the main spindle.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61618 [Channel %1: ] Block %2: Main spindle has not been set up**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** A main spindle has not been set up.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please check the following machine or setting data:  
MD 20070 \$MC\_AXCONF\_MACHAX\_USED[]  
MD 20080 \$MC\_AXCONF\_CHANAX\_NAME\_TAB[]  
MD 35000 \$MA\_SPIND\_ASSIGN\_TO\_MACHAX[]  
MD 52206 \$MCS\_AXIS\_USAGE[]

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61619 [Channel %1: ] Block %2: Main spindle has not been correctly set up**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The main spindle has not been correctly set up.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Please check the following machine or setting data:  
MD 20070 \$MC\_AXCONF\_MACHAX\_USED[]  
MD 20080 \$MC\_AXCONF\_CHANAX\_NAME\_TAB[]  
MD 35000 \$MA\_SPIND\_ASSIGN\_TO\_MACHAX[]  
MD 52206 \$MCS\_AXIS\_USAGE[]  
MD 52207 \$MCS\_AXIS\_USAGE\_ATTRIB bit 8

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61620 [Channel %1: ] Block %2: %4-Mirroring for the linear axis of the counter spindle not permitted**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** It is not permissible that the linear axis of the counterspindle machining has Z mirroring.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Deselect Z mirroring in the WO used.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61621 [Channel %1: ] Block %2: Angle of opening of the convex thread too high**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Convexity of the thread is too high.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** - Check parameter XS or RS

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61622 [Channel %1: ] Block %2: Toolcarrier for turning not set up**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** A toolcarrier was not set up for turning.
