| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Cause:</b>         | <p>The rotating measurement is activated. For the rotating measurement, the motor can accelerate up to the maximum speed and with maximum torque. Only the parameterized current limit (p0640) and the maximum speed (p1082) are effective. The behavior of the motor can be influenced using the direction inhibit (p1959.14, p1959.15) and the ramp-up/ramp-down time (p1958).</p> <p>The rotating measurement is carried out at the next switch-on command.</p> <p>See also: p1960</p> |
| <b>Remedy:</b>        | <p>Not necessary.</p> <p>The alarm is automatically withdrawn after the rotating measurement has been successfully completed or for the setting p1960 = 0.</p> <p>Note:</p> <p>If a POWER ON or a warm restart is performed with motor data identification selected, the motor data identification request will be lost. If motor data identification is required, it will need to be selected again manually following ramp-up.</p>                                                      |

---

- Cause:** A fault has occurred during the identification routine.  
Fault value (r0949, interpret decimal):
- 1: piston calibration without absolute position ( $p1407.3 = 0$ ).
  - 2: determining the control sense without moving in both directions.
  - 3: determining the control sense without a clear result.
  - 4: determining the valve offset without moving.
  - 5: traversing range identification without absolute position or piston calibration.
  - 6: the measured piston stroke differs from the parameterized piston stroke (p0313) by more than 20 %.
  - 7: For the characteristic measurement, the drive comes to a standstill before reaching the parameterized free distance.
  - 8: The loop gain of the force controller is incorrect. At the positive end stop,  $pA (r0067) < pB (r0068)$ .
  - 10: There are less than 10 measuring points not equal to zero on one of the two characteristic sides (r1962). The measured characteristic is not evaluated.
  - 100: Position and speed actual value inversion differ (p0410).
  - 101: Start of measuring range > end of measuring range ( $p1955[0] > p1955[1]$ ).
  - 102: Minimum measuring travel > maximum measuring travel ( $p1956[0] > p1956[1]$ ).
  - 190: Velocity setpoint is not zero.

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b> | A fault has occurred during the identification routine.<br>Fault value (r0949, interpret decimal):<br>10: Data set changeover during motor data identification.<br>101: Voltage amplitude even at 30% maximum current amplitude is too low to measure the inductance.<br>102, 104: Voltage limiting while measuring the inductance.<br>103: Maximum frequency exceeded during the rotating inductance measurement.<br>110: Motor not finely synchronized before the rotating measurement.<br>111: The zero mark is not received within 2 revolutions.<br>112: Fine synchronization is not realized within 8 seconds after the zero mark has been passed.<br>113: The power, torque or current limit is zero.<br>115: U/f control is active.<br>120: Error when evaluating the magnetizing inductance.<br>125: Cable resistance greater than the total resistance.<br>126: Series inductance greater than the total leakage inductance.<br>127: Identified leakage inductance negative.<br>128: Identified stator resistance negative.<br>129: Identified rotor resistance negative.<br>130: Drive data set changeover during the motor data identification routine.<br>140: The setpoint channel inhibits both directions.<br>150: The holding brake is closed using command "Unconditionally close holding brake" (p0858).<br>151: The determined force due to weight is higher than the rated motor torque (p0333).<br>152: The torque precontrol channel (CI: p1511) is already interconnected.<br>153: The saturation characteristic cannot be approximated and evaluated.<br>154: The optimum flux characteristic cannot be determined from the saturation characteristic.<br>160: Accelerating time when determining kT, moment of inertia or reluctance torque too short or too long.<br>161: When measuring the kT characteristic, constants kT1, kT3, kT5 and kT7 were not able to be determined (p0645 ... p0648), as too few points were measured.<br>165: The current limit was reduced below the measurement current while determining the reluctance torque.<br>173: Internal problem.<br>180: identification speed (maximum speed, rated speed, 0.9 x p0348) less than p1755 or no DC link voltage available.<br>181: Zero speed at the end of the measurement of periodic position errors.<br>182: No complete mechanical revolution at to the end of the measurement of periodic position errors.<br>190: Speed setpoint not equal to zero.<br>191: An actual speed of zero is not reached.<br>192: Speed setpoint not reached.<br>193: Inadmissible motion of the motor when identifying the voltage emulation error.<br>194: Supplementary torque (r1515) not equal to zero.<br>195: Closed-loop torque control active.<br>200, 201: Not possible to identify the voltage emulation error characteristic of the drive converter (p1952, p1953). |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Remedy:**

For fault value = 10:

- do not initiate a data set changeover during the motor data identification.

For fault value = 101:

- increase current limit (p0640) or torque limit (p1520, p1521).
- check current controller gain (p1715).
- reduce current controller sampling time (p0115).

It may be impossible to completely identify the L characteristic, as required current amplitude is too high.

- suppress meas. (p1909, p1959).

For fault value = 102, 104:

- reduce current limit (p0640).
- check current controller P gain.
- suppress meas. (p1909, p1959).

For fault value = 103:

- increase external moment of inertia (if possible).
- reduce current controller sampling time (p0115).
- suppress meas. (p1909, p1959).

For fault value = 110:

- before rotating measurement, traverse motor over zero mark.

For fault value = 111:

- it is possible that encoder does not have zero mark. Correct setting in p0404.15.
- encoder pulse number was incorrectly entered. Correct setting in p0408.
- if zero mark signal is defective, replace encoder.

For fault value = 112:

- upgrade encoder software.

For fault value = 113:

- check the limits (p0640, p1520, p1521, p1530, p1531), correct the zero values.

For fault value = 115:

- deselect U/f control (p1317 = 0).

For fault value = 120:

- check current controller P gain (p1715) and if required, reduce.
- increase the pulse frequency (p1800).

For fault value = 125:

- reduce cable resistance (p0352).

For fault value = 126:

- reduce series inductance (p0353).

For fault = 127, 128, 129:

- it is possible that current controller is oscillating. Reduce the P gain (p1715).
- if required, reduce the current limit (p0640).

For fault value = 130:

- do not initiate a drive data set changeover during motor ident. routine.

For fault value = 140:

- before the measurement, enable at least one direction (p1110 = 0 or p1111 = 0 or p1959.14 = 1 or p1959.15 = 1).

For fault value = 150:

- if necessary withdraw command "Unconditionally close holding brake" (BI: p0858 = 0 signal).

For fault value = 151:

- the motor cannot continuously hold the force due to weight. Either reduce the force due to weight or use a motor with a higher rated torque.

For fault value = 152:

- add the measured force due to weight (p1532) to the signal source of p1511.
- if necessary withdraw the BICO interconnection from p1511 (p1511 = 0), and repeat the measurement.

For fault value = 153/154:

- optimum characteristic was not able to be evaluated and activated. If necessary contact the service department, and attach the values of r1962[0...9] and r1963[0...9].

For fault value = 160:

- extend accelerating time when determining kT, moment of inertia and reluctance torque, e.g. by increasing max. speed (p1082), increasing moment of inertia or reducing max. current (p0640).
- in encoderless operation with load moment of inertia, parameterize the load moment of inertia (p1498).
- reduce the ramp-up time (p1958).
- increase speed controller P gain (p1460).
- suppress meas. (p1959).

For fault value = 161:

- reduce the ramp-up time (p1958).
- increase max. speed (p1082).
- reduce current limit (p0640).
- if required, do not activate the kT characteristic (p1780.9 = 0).

For fault value = 165:

- decrease max. current (p0640).

For fault value = 173:

-

For fault value = 180:

- switch-on the infeed
- increase max. speed (p1082).
- reduce p1755.
- suppress meas. (p1909, p1959).

For fault value = 181, 182:

- increase max. speed (p1082).
- if required, deactivate the measurement (p1959.0 = 0).

Note:

- to measure periodic position errors, the encoder must have absolute position information (unique zero mark, distance-coded zero marks, absolute encoder, 1-pole resolver p5263.10).

For fault value = 190:

- set speed setpoint to zero.

For fault value = 191:

- do not start motor data identification routine while motor is still rotating.

For fault value = 192:

- check closed-loop speed control (motor rotor may be locked or closed-loop speed control is not functioning).
- for p1215 = 1, 3 (brake the same as the sequence control) check the control sense (p0410.0).
- ensure that enable signals are present during measurement.
- remove any pulling loads from motor.
- increase max. current (p0640).
- reduce max. speed (p1082).
- suppress meas. (p1959).

For fault value = 193:

- the motor has moved through more than 5 ° electrical (r0093). Lock motor rotor at one of these pole position angles (r0093): 90 °, 210 ° or 330 ° (+/-5 °) and then start identification.

For fault value = 194:

- switch out all supplementary torques (e.g. CI: p1511).
- for hanging/suspended axes: Lock motor rotor at one of these pole position angles (r0093): 90 °, 210 ° or 330 ° (+/-1 °) and then start identification.

For fault value = 195:

- deselect closed-loop torque control (p1300 = 21 or 20, or set the signal source in p1501 to a 0 signal).

For fault value = 200, 201:

- set pulse frequency to 0.5 x current controller frequency (e.g. 4 kHz for a current controller sampling time = 125 us).
- reduce cable length between Motor Module and motor.
- read-out measured values (r1950, r1951) and therefore determine suitable values for p1952, p1953 according to your own estimation.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Cause:         | Either the direction of the rotating field or the encoder actual value has an incorrect sign. The motor data identification automatically changed the actual value inversion (p0410) in order to correct the control sense. This can result in a direction of rotation change.<br>Note:<br>To acknowledge this fault, the correctness of the direction of rotation must first be acknowledged with p1910 = -2.                                         |
| Remedy:        | Check the direction of rotation (also for the position controller, if one is being used).<br>If the direction of rotation is correct, the following applies:<br>No additional measures are required (except set p1910 = -2 and acknowledge fault).<br>If the direction of rotation is incorrect, the following applies:<br>To change the direction of rotation, two phases must be interchanged and the motor identification routine must be repeated. |

| Reaction:      | OFF2                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Acknowledge:   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Cause:** The pole position identification routine was unsuccessful.  
 Fault value (r0949, interpret decimal):

- 1: No current is established.
- 2: The starting current is not zero.
- 3: The selected max. distance was exceeded (p1981).
- 4x: The measuring signal does not permit a clear evaluation.
- 5: The max. current was exceeded during the measurement.
- 6: The current measurement must be re-calibrated.
- 7x: The Sensor Module does not support the pole position identification routine.
- 8: The pole position identification routine current required is greater than the max. current.
- 9: The set pole position identification routine current is zero.
- 10: Data set changeover during the pole position identification.
- 11: The encoder adjustment to determine the commutation angle is active (p1990 = 1) and the encoder without zero mark is not finely synchronized or does not have any valid data.
- 100: motion-based pole position identification, 1st and 2nd Measurements differ. Motor blocked or current (p1993) too low.
- 101: Motion-based pole position identification, insufficient motion, motor blocked or current (p1993) too low.
- 102: Motion-based pole position identification, brake is being used and is closed. The motion-based pole position identification in conjunction with the brake is not permitted.
- 103: Motion-based pole position identification without encoder.
- 104: Motion-based pole position identification, speed actual value not zero after stabilizing time.
- 200: Elasticity-based pole position identification, internal error in the arctan calculation (0/0).
- 201: Elasticity-based pole position identification, too few measuring points that can be evaluated.
- 202: Elasticity-based pole position identification, outliers in the measurement series.
- 203: Elasticity-based pole position identification, maximum rotation without current.
- 204: Elasticity-based pole position identification, no positive edge found.
- 205: Elasticity-based pole position identification, the result of the Fourier transformation differs by more than 480 ° electrical / p3093 from the rough estimate.
- 206: Elasticity-based pole position identification, plausibility test unsuccessful.
- 207: Elasticity-based pole position identification, no negative measured value found.

It is possible that all measured values are identical. The expected deflection was not able to be reached, either because the expectation is too high or not enough current was able to be established.

- 208: Elasticity-based pole position identification, measuring current is 0.
- 209: Elasticity-based pole position identification, the selected max. distance was exceeded (p3095).
- 210: Elasticity-based pole position identification without encoder.

250 ... 260:  
 Elasticity-based pole position identification, more than 3 attempts have been made and fault value 200 ... 210 output.

Example:  
 Fault value= 253 --> more than 3 attempts have been made and fault value 203 output.

**Remedy:**

For fault value = 1:

- check the motor connection and DC link voltage.
- for the following parameters, set practical values that are not zero (p0325, p0329).

For fault value = 1, 2:

- in the case of a large computing time load (e.g. 6 drives with Safety Integrated), set the computing dead time of the current controller to late transfers (p0117 = 3).

For fault value = 3:

- increase the max. distance (p1981).
- reduce the currents for the pole position identification routine (p0325, p0329).
- stop the motor in order to carry out the pole position identification routine.

For fault value = 5:

- reduce the currents for the pole position identification routine (p0325, p0329).

For fault value = 6:

- re-calibrate the Motor Module.

For fault value = 8:

- reduce the currents for the pole position identification routine (p0329, p0325, p1993).
- the power unit cannot provide the necessary pole position identification routine current ( $p0209 < p0329$ , p0325, p1993), replace the power unit with a power unit with a higher max. current.

For fault value = 9:

- enter a value not equal to zero in the pole position identification routine current (p0329, p0325, p1993).

For fault value = 10:

- do not initiate a data set changeover during the pole position identification.

For fault value = 11:

- for incremental encoders without commutation with zero mark ( $p0404.15 = 0$ ), it does not make sense to adjust the encoder to determine the commutation angle ( $p1990 = 1$ ). In this case, the function should be deselected ( $p1990 = 0$ ) or, for an encoder with suitable zero mark, commutation with zero mark should be selected ( $p0404.15 = 1$ ).
- for absolute encoders, only adjust the encoder to determine the commutation angle ( $p1990 = 1$ ) if the encoder supplies commutation information and is finely synchronized ( $p1992.8 = 1$  and  $p1992.10 = 1$ ). The encoder is possibly parked, deactivated (p0145), not ready for operation or signals a fault condition.
- deselect the encoder adjustment to determine the commutation angle (set p1990 to 0).

For fault value = 40 ... 49:

- increase the currents for the pole position identification routine (p0325, p0329).
- stop the motor in order to carry out the pole position identification routine.
- select another technique for pole position identification routine (p1980).
- use another motor, absolute encoder or Hall sensors.

For fault value = 70 ... 79:

- upgrade the software in the Sensor Module.

For fault value = 100, 101:

- check and ensure that the motor is free to move.
- increase the current for motion-based pole position identification (p1993).

For fault value = 102:

- if the motor is to be operated with a brake: Select a different technique to identify the pole position (p1980).
- if the motor can be operated without a brake: Open the brake ( $p1215 = 2$ ).

For fault value = 103:

- the motion-based pole position identification can only be carried out using an encoder. Connect an encoder or select another technique for pole position identification routine (p1980).

For fault value = 104:

- pole position identification, increase the smoothing time, motion-based (p1997).
- pole position identification, increase the rise time, motion-based (p1994).
- pole position identification, check the gain, motion-based (p1995).
- pole position identification, check the integral time, motion-based (p1996).
- for motor encoders with track A/B sq-wave ( $p0404.3 = 1$ ) and flank time measurement ( $p0430.20 = 0$ ), disable the integral time ( $p1996 = 0$ ).

For fault value = 200:

- check parameter setting (p3090 ... p3096).

For fault value = 201:

- check parameter setting (p3090 ... p3096).
- reduce p3094.

For fault value = 202:

- check parameter setting (p3090 ... p3096).
- fault has occurred during the identification. Repeat the measurement.
- check the brake or brake control.

For fault value = 203:

- check the brake or brake control.
- check the measuring current (p3096).
- increase p3094.

For fault value = 204:

- check parameter setting (p3090 ... p3096).

For fault value = 205:

- check parameter setting (p3090 ... p3096).

For fault value = 206:

- check parameter setting (p3090 ... p3096).
- fault has occurred during the identification. Repeat the measurement.
- check the brake or brake control.

For fault value = 207:

- reduce the expected deflection (p3094).
- increase the measuring current (p3096).

For fault value = 208:

- set the measuring current (p3096).

For fault value = 209:

- check parameter setting p3095.
- check the brake or brake control.

For fault value = 210:

- the elasticity-based pole position identification can only be carried out using an encoder. Connect an encoder or select another technique for pole position identification routine (p1980).

For fault value = 250 ... 260:

- check parameter setting (p3090 ... p3096, p1980).

---

**207996 <location>Drive: Pole position identification routine not carried out**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** ENCODER (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** In operation, the operating mode that requires a pole position identification was changed over, which is not possible in this state.

- the drive was changed over, flying, from encoderless operation to operation with encoder without having previously carried out a pole position identification for the encoder. p1404 is then at a value between zero and the max. speed and the pulses in the speed range above p1404 were enabled without a pole position ident. routine having been previously carried out in operation with encoder.

- in operation, an EDS changeover was made to an encoder where it is necessary to carry out a pole position identification. However, this has still not been carried out (p1982 = 1 or 2 and p1992.7 = 0).

**Remedy:** - for a flying changeover between operation with and without encoder with pole position identification after POWER ON or commissioning (p0010 not equal to zero) enable the pulses once at zero speed. This means that the pole position identification routine is carried out and the result is available for operation.

- carry out the EDS changeover with the pulses inhibited, or, before the changeover, carry out a pole position identification using this data set.

|                       |                                                                                                                                                                                                                                                                                                    |

**Cause:** The cyclic actual and/or setpoint values were not transferred within the specified times.  
Alarm value (r2124, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:** Check the parameterizing telegram (Ti, To, Tdp, etc.).

#### 208510 <location>PN/COMM BOARD: Send configuration data invalid

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** Infeed: OFF1 (OFF2)  
Servo: OFF1 (OFF2, OFF3)  
Hla: OFF1 (OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** COMM BOARD did not accept the send-configuration data.  
Fault value (r0949, interpret decimal):  
Return value of the send-configuration data check.

**Remedy:** Check the send configuration data.

#### 208511 <location>PN/COMM BOARD: Receive configuration data invalid

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The drive unit did not accept the receive configuration data.  
Alarm value (r2124, interpret decimal):  
Return value of the receive configuration data check.

- 1: Connection established to more drive objects than configured in the device. The drive objects for process data exchange and their sequence are defined in p0978.
- 2: Too many PZD data words for output or input to a drive object. The number of possible PZD items in a drive object is determined by the number of indices in r2050/p2051 for PZD IF1, and in r8850/p8851 for PZD IF2.
- 3: Uneven number of bytes for input or output.
- 4: Setting data for synchronization not accepted. For more information, see A01902.
- 5: Cyclic operation not active.
- 17: CBE20 Shared Device: Configuration of the F-CPU has been changed.
- 223: Illegal clock synchronization for the PZD interface set in p8815[0].
- 257: PN Shared Device: Too many PZD data words for output or input in the overall device.
- 500: Illegal PROFIsafe configuration for the interface set in p8815[1].
- 501: PROFIsafe parameter error (e.g. F\_dest).
- 503: PROFIsafe connection is rejected as long as there is no isochronous connection (p8969).

**Additional values:**  
Only for internal Siemens troubleshooting.

**Remedy:** Check the receive configuration data.  
For alarm value = 1, 2:  
- check the list of the drive objects with process data exchange (p0978). With p0978[x] = 0, all of the following drive objects in the list are excluded from the process data exchange.  
For alarm value = 2:  
- check the number of data words for output and input to a drive object.  
For alarm value = 17:  
- CBE20 Shared Device: Unplug/plug A-CPU.  
For alarm value = 223, 500:  
- check the setting in p8839 and p8815.  
- ensure that only one PZD interface is operated in clock synchronism or with PROFIsafe.  
For alarm value = 257:  
- check the number of data words for output and input to the complete device.  
For alarm value = 501:  
- check the set PROFIsafe address (p9610).

---

**208520 <location>PN/COMM BOARD: Non-cyclic channel error**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The memory or the buffer status of the non-cyclic channel has an error.  
Alarm value (r2124, interpret decimal):  
0: Error in the buffer status.  
1: Error in the memory.  
**Remedy:** Check communications link.

---

**208526 <location>PN/COMM BOARD: No cyclic connection**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** There is no cyclic connection to the control.  
**Remedy:** Establish the cyclic connection and activate the control with cyclic operation.  
For PROFINET, check the parameters "Name of Station" and "IP of Station" (r61000, r61001).  
If a CBE20 is inserted and PROFIBUS is to communicate via PZD Interface 1, then this must be parameterized using the STARTER commissioning tool or directly using p8839.

---

**208530 <location>PN/COMM BOARD: Message channel error**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The memory or the buffer status of the message channel has an error.  
Alarm value (r2124, interpret decimal):  
0: Error in the buffer status.  
1: Error in the memory.  
**Remedy:** Check communications link.

| <b>Cause:</b>         | <p>A consistency error was detected when activating the configuration (p8925) for the PROFINET interface.<br/>Alarm value (r2124, interpret decimal):<br/>0: general consistency error<br/>1: error in the IP configuration (IP address, subnet mask or standard gateway).<br/>2: Name of station error.<br/>3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists.<br/>4: a cyclic PROFINET connection is not possible as DHCP is activated.<br/>5: standard gateway is also set at the Industrial Ethernet interface (X127).<br/>6: standard station name is also set at the Industrial Ethernet interface (X127).<br/>7: IP address is located in the same subnet as the IP address of the Industrial Ethernet interface (X127).<br/>Note:<br/>For alarm value = 0, 1, 2, 3, 4, 5, 7, the following applies: the configuration was not changed.<br/>For alarm value = 6 the following applies: The new configuration was however activated.<br/>DHCP: Dynamic Host Configuration Protocol</p> |

**Remedy:**

- check the required interface configuration (p8940 and following), correct if necessary, and activate (p8945).
- or
- reinitialize the station using the "Edit Ethernet node" screen form (e.g. with STARTER commissioning tool).

#### **208564 <location>PN/COMM BOARD: syntax error in the configuration file**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A syntax error has been detected in the ASCII configuration file for the Communication Board Ethernet 20/25/41 (CBE20/CBE25/CBE41). The saved configuration file has not been loaded.

**Remedy:**

- Correct and activate the CBExx configuration (p8940 and following) (p8945 = 2).
- Reinitialize the CBExx (e.g. using the STARTER commissioning tool)

**Note:**

The configuration is not applied until the next POWER ON!

#### **208565 <location>PNCOMM BOARD: Consistency error affecting adjustable parameters**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A consistency error was detected when activating the configuration (p8945) for the Communication Board Ethernet 20/25/41 (CBE20/CBE25/CBE41).

Alarm value (r2124, interpret decimal):

0: general consistency error

1: error in the IP configuration (IP address, subnet mask or standard gateway).

2: Error in the station names.

3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists.

4: a cyclic PROFINET connection is not possible as DHCP is activated.

**Note:**

For all alarm values, the following applies: currently set configuration has not been activated.

DHCP: Dynamic Host Configuration Protocol

**Remedy:**

- check the required interface configuration (p8940 and following), correct if necessary, and activate (p8945).
- or
- reinitialize the station using the "Edit Ethernet node" screen form (e.g. with STARTER commissioning tool).

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                           |
| <b>Cause:</b>         | <p>The monitoring time of the CANopen RPDO telegram has expired because the bus connection was either interrupted or the CANopen Master was switched-off.</p> <p>See also r8843.0 IF2 PZD status - setpoint failure or r8843.2 IF2 PZD status - fieldbus running.</p> |

**Remedy:**

- check the bus cable
- check the master.
- If required, increase the monitoring time (p8699).

---

### 208703 <location>CAN: Maximum number of drive objects exceeded

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:**

Infeed: OFF2 (NONE, OFF1)

Servo: OFF3 (NONE, OFF1, OFF2)

Hla: OFF3 (NONE, OFF1, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** The maximum number of 8 drive objects with the "CAN" function module was exceeded.

Note:

In the CANopen standard, a maximum of 8 CANopen device modules (drive objects with function module "CAN") are defined for each CANopen slave.

**Remedy:**

- New commissioning of maximum 8 drive objects with the "CAN" function module in the topology.
- For the drive objects, if required, deselect the "CAN" function module (r0108.29).

---

### 208751 <location>CAN: Telegram loss

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The CAN controller has lost a receive message.

Alarm value (r2124, interpret decimal):

Hardware channel in the CAN controller.

0: Firmware version < 5.2 (no reference to the original hardware channel).

1: NMT command message

2: SYNC message

3: NMT error control message

7 ... 31: RPDO message

32: SDO message

**Remedy:**

- increase the cycle times of the received messages.
- CANopen reduce sampling time (p8848).

See also:p8848 (IF2 PZD sampling time)

---

### 208752 <location>CAN: Error counter for error passive exceeded

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The error counter for the send or receive telegrams has exceeded the value 127.

**Remedy:**

- check the bus cable
- set a higher baud rate (p8622).
- check the bit timing and if required optimize (p8623).

---

### 208753 <location>CAN: Message buffer overflow

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A message buffer overflow.  
Alarm value (r2124, interpret decimal):  
1: Non-cyclic send buffer (SDO response buffer) overflow.  
2: Non-cyclic receive buffer (SDO receive buffer) overflow.  
3: Cyclic send buffer (PDO send buffer) overflow.

**Remedy:** - check the bus cable.  
- set a higher baud rate (p8622).  
- check the bit timing and if required optimize (p8623).  
For alarm value = 2:  
- reduce the cycle times of the SDO receive messages.  
- SDO request from master only after SDO feedback for previous SDO request.

---

**208754 <location>CAN: Incorrect communications mode**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** In the "operational" mode, an attempt was made to change parameters p8700 ... p8737.

**Remedy:** Change to the "pre-operational" or "stopped" mode.

---

**208755 <location>CAN: Object cannot be mapped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The CANopen object is not provided for the Process Data Object (PDO) Mapping.

**Remedy:** Use a CANopen object intended for the PDO mapping or enter 0.

The following objects can be mapped in the Receive Process Data Object (RPDO) or Transmit Process Data Object (TPDO):

- RPDO: 6040 hex, 6060 hex, 60FF hex, 6071 hex; 5800 hex - 580F hex; 5820 hex - 5827 hex

- TPDO: 6041 hex, 6061 hex, 6063 hex, 6069 hex, 606B hex, 606C hex, 6074 hex; 5810 hex - 581F hex; 5830 hex - 5837 hex

Only sub-index 0 of the specified objects can be mapped.

Note:

As long as A08755 is present, the COB-ID cannot be set to valid.

---

**208756 <location>CAN: Number of mapped bytes exceeded**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The number of bytes of the mapped objects exceeds the telegram size for net data. A max. of 8 bytes is permissible.

**Remedy:** Map fewer objects or objects with a smaller data type.

---

**208757 <location>CAN: Set COB-ID invalid**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** For online operation, the appropriate COB-ID must be set invalid before mapping.

Example:

Mapping for RPDO 1 should be changed (p8710[0]).

--> set p8700[0] = C00006E0 hex (invalid COB-ID)

--> set p8710[0] as required.

--> p8700[0] enter a valid COB-ID

**Remedy:** Set the COB-ID to invalid.

## 208758 <location>CAN: Maximum number of valid PDO exceeded

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An attempt was made to exceed the maximum number of valid PDO.

Alarm value (r2124, interpret decimal):

1:

An attempt was made to exceed the total number of valid RPDO of all CANopen supported drive objects.

As a result of the hardware, the limit is 25 valid RPDO.

2:

An attempt was made to exceed the total number of valid TPDO of all CANopen supported drive objects.

The limit is defined by the following ratio:

CAN sampling time (p8848) / CAN minimum processing time (r8739)

Note:

RPDO: Receive Process Data Object

TPDO: Transmit Process Data Object

**Remedy:** Comply with the limit for the maximum number of valid RPDO or TPDO.

Apply one of the following options to delete the alarm:

- successfully write to the COB ID index of a PDO communication parameter (p870x[0], p872x[0]).

- change CANopen NMT state.

- execute CANopen NMT command reset node.

- execute CANopen NMT command reset communication.

- carry out a warm restart (p0009 = 30, p0976 = 2).

- carry out a POWER ON (switch-off/switch-on).

Note:

The remaining available RPDO or TPDO are indicated in r8742.

## 208759 <location>CAN: PDO COB-ID already available

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** Parameter: %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An existing PDO COB-ID was allocated.

Alarm value (r2124, interpret decimal):

Parameter number.

Note:

The COB-ID is included in index zero (p870x[0], p872x[0]).

**Remedy:** Select another PDO COB-ID.

## 208760 <location>CAN: maximum size of the IF PZD exceeded

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The maximum size of the IF PZD was exceeded.  
Alarm value (r2124, interpret decimal):  
1: error for IF PZD receive.  
2: error for IF PZD send.  
Note:  
IF: interface  
**Remedy:** Map fewer process data in PDO.  
Apply one of the following options to delete the alarm:  
- POWER ON (switch-off/switch-on).  
- carry out a warm restart (p0009 = 30, p0976 = 2).  
- execute CANopen NMT command reset node.  
- change CANopen NMT state.  
- delete alarm buffer [0...7] (p2111 = 0).

---

**208800 <location>PROFenergy energy-saving mode active**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The PROFenergy energy-saving mode is active  
Alarm value (r2124, interpret decimal):  
Mode ID of the active PROFenergy energy-saving mode.  
**Remedy:** The alarm is automatically withdrawn when the energy-saving mode is exited.  
Note:  
The energy-saving mode is exited after the following events:  
- the PROFenergy command end\_pause is received from the higher-level control.  
- the higher-level control has changed into the STOP operating state.  
- the PROFINET connection to the higher-level control has been disconnected.

---

**Remedy:** For fault value = 0:  
- insert the correct memory card and carry out POWER ON.  
For fault value = 2, 3, 12, 13:  
- contact the responsible OEM.  
- Deactivate copy protection (p7765) and acknowledge the fault (p3981).  
- Deactivate know-how protection (p7766 ... p7768) and acknowledge the fault (p3981).  
**Note:**  
In general, the copy protection can only be changed when know-how protection is deactivated.  
KHP: Know-How Protection  
See also: p3981 (Acknowledge drive object faults)

---

**213101 <location>Know-how protection: Copy protection cannot be activated**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** An error occurred when attempting to activate the copy protection for the memory card.  
Fault value (r0949, interpret decimal):  
0: A memory card is not inserted.  
**Note:**  
KHP: Know-How Protection  
**Remedy:** - insert the memory card and carry out POWER ON.  
- Try to activate copy protection again (p7765).

---

**213102 <location>Know-how protection: Consistency error of the protected data**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** OFF1  
**Acknowledge:** IMMEDIATELY  
**Cause:** An error was identified when checking the consistency of the protected files. As a consequence, the project on the memory card cannot be run.  
Fault value (r0949, interpret hexadecimal):  
yyyyxxx hex: yyyy = object number, xxx = fault cause  
xxx = 1:  
A file has a checksum error.  
xxx = 2:  
The files are not consistent with one another.  
xxx = 3:  
The project files, which were loaded into the file system via load (download from the memory card), are inconsistent.  
**Note:**  
KHP: Know-How Protection  
**Remedy:** - Replace the project on the memory card or replace project files for download from the memory card.  
- Restore the factory setting and download again.

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Cause:</b>         | <p>The power unit has detected overvoltage in the DC link.</p> <ul style="list-style-type: none"> <li>- motor regenerates too much energy.</li> <li>- device supply voltage too high.</li> <li>- when operating with a Voltage Sensing Module (VSM), the phase assignment L1, L2, L3 at the VSM differs from the phase assignment at the power unit.</li> <li>- line phase interrupted.</li> </ul> <p>Fault value (r0949, interpret decimal):</p> <p>DC link voltage at the time of trip [0.1 V].</p> |

- Remedy:**
- increase the ramp-down time
  - activate the DC link voltage controller (p1240)
  - use a brake resistor or Active Line Module
  - increase the current limit of the infeed or use a larger component (for the Active Line Module)
  - check the device supply voltage
  - check and correct the phase assignment at the VSM and at the power unit
  - check the line supply phases.

**230003 <location>Power unit: DC link voltage undervoltage**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit has detected an undervoltage condition in the DC link.

- line supply failure
- line supply voltage below the permissible value.
- line supply infeed failed or interrupted.
- line phase interrupted.

**Note:**

The monitoring threshold for undervoltage in the DC link is indicated in r0296.

- Remedy:**
- check the line supply voltage
  - check the line supply infeed and observe the fault messages relating to it (if there are any)
  - check the line supply phases.
  - check the line supply voltage setting (p0210).
  - booksized units: check the setting of p0278.

**Note:**

The ready signal for the infeed (r0863) must be interconnected to the associated drive inputs (p0864).

**230004 <location>Power unit: Overtemperature heat sink AC inverter**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature of the power unit heat sink has exceeded the permissible limit value.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

Fault value (r0949, interpret decimal):

Temperature [0.01 °C].

- Remedy:**
- check whether the fan is running.
  - check the fan elements.
  - check whether the ambient temperature is in the permissible range.
  - check the motor load.
  - reduce the pulse frequency if this is higher than the rated pulse frequency.

**Notice:**

This fault can only be acknowledged after the alarm threshold for alarm A05000 has been undershot.

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Cause:</b>         | <p>The Control Unit has not punctually updated the cyclic setpoint telegram to the power unit. The number of consecutive tolerated sign of life errors has exceeded the fault threshold (p7789) set in the power unit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Remedy:**

- for projects with the VECTOR drive object, check whether p0117 = 6 has been set on the Control Unit.
- increase the fault threshold (p7789).
- check the Motor Module, and if required replace.

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A DRIVE-CLiQ communication error has occurred between the Control Unit and the power unit involved.  
The cyclic setpoint telegrams of the Control Unit were not received on time by the power unit for at least one clock cycle.

**Remedy:** Check the Motor Module and if required, replace.

---

**230011 <location>Power unit: Line phase failure in main circuit**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2 (OFF1)

**Acknowledge:** IMMEDIATELY

**Cause:** At the power unit, the DC link voltage ripple has exceeded the permissible limit value.  
Possible causes:

- a line phase has failed.
- the 3 line phases are inadmissibly asymmetrical.
- the capacitance of the DC link capacitor forms a resonance frequency with the line inductance and the reactor integrated in the power unit.
- the fuse of a phase of a main circuit has ruptured.
- a motor phase has failed.
- for power units operated on a single phase, the permissible active power was exceeded.

Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- check the main circuit fuses.
- check whether a single-phase load is distorting the line voltages.
- Detune the resonant frequency with the line inductance by using an upstream line reactor.
- Dampen the resonant frequency with the line inductance by switching over the DC link voltage compensation in the software (see p1810) – or increase the smoothing (see p1806). However, this can have a negative impact on the torque ripple at the motor output.
- check the motor feeder cables.

---

**230012 <location>Power unit: Temperature sensor wire breakage**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF1 (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** The connection to a temperature sensor in the power unit is interrupted.

Fault value (r0949, interpret binary):

Bit 0: Module slot (electronics slot)

Bit 1: Air intake

Bit 2: Inverter 1

Bit 3: Inverter 2

Bit 4: Inverter 3

Bit 5: Inverter 4

Bit 6: Inverter 5

Bit 7: Inverter 6

Bit 8: Rectifier 1

Bit 9: Rectifier 2

Bit 14: Capacitor air discharge

Bit 15: Liquid intake

**Remedy:** Contact Technical Support.

### **230013** <location>Power unit: Temperature sensor short circuit

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF1 (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** A temperature sensor in the power unit is short-circuited.

Fault value (r0949, interpret binary):

Bit 0: Module slot (electronics slot)

Bit 1: Air intake

Bit 2: Inverter 1

Bit 3: Inverter 2

Bit 4: Inverter 3

Bit 5: Inverter 4

Bit 6: Inverter 5

Bit 7: Inverter 6

Bit 8: Rectifier 1

Bit 9: Rectifier 2

Bit 14: Capacitor air discharge

Bit 15: Liquid intake

**Remedy:** Contact Technical Support.

### **230015** <location>Power unit: Phase failure motor cable

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A phase failure in the motor feeder cable was detected.

The signal can also be output in the following case:

- the motor is correctly connected, however the closed-speed control is instable and therefore an oscillating torque is generated.

Note:

Chassis power units do not feature phase failure monitoring.

**Remedy:**

- check the motor feeder cables.
- check the speed controller settings.

---

**230016 <location>Power unit: Load supply switched off****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** The DC link voltage is too low.  
Alarm value (r2124, interpret decimal):  
DC link voltage at the time of the trip [V].**Remedy:** - switch on load supply.  
- check the line supply if necessary.

---

**230017 <location>Power unit: 26.5 V supply voltage fault****Drive object:** HLA\_828**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY**Cause:** For a drive that has been enabled, it has been identified that the 26.5 V supply voltage for the Hydraulic Module has a fault (X271).  
Permissible range: 26.0 ... 27.0 V  
Fault value (r0949, interpret decimal):  
Voltage value [0.1 V].**Remedy:** - check the 26.5 V supply voltage (X271).

---

**230017 <location>Power unit: Hardware current limit has responded too often****Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** Fault cause: %1 bin**Reaction:** OFF2**Acknowledge:** IMMEDIATELY**Cause:** The hardware current limitation in the relevant phase (see A30031, A30032, A30033) has responded too often. The number of times the limit has been exceeded depends on the design and type of power unit.

For infeed units, the following applies:

- closed-loop control is incorrectly parameterized.
- load on the infeed is too high.
- Voltage Sensing Module incorrectly connected.
- line reactor missing or the incorrect type.
- power unit defective.

The following applies to Motor Modules:

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

Fault value (r0949, interpret binary):

Bit 3: phase U

Bit 4: phase V

Bit 5: phase W

Additional bits:

Only for internal Siemens troubleshooting.

Note:

Fault value = 0 means that the phase with current limiting is not recognized (e.g. for blocksize device).

- Remedy:**
- For infeed units, the following applies:
    - check the controller settings and reset and identify the controller if necessary (p0340 = 2, p3410 = 5)
    - reduce the load and increase the DC link capacitance or use a higher-rating infeed if necessary
    - check the connection of the optional Voltage Sensing Module
    - check the connection and technical data of the commutating reactor.
    - check the power cables for short-circuit or ground fault.
    - replace power unit.
  - The following applies to Motor Modules:
    - check the motor data and if required, recalculate the controller parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).
    - check the motor circuit configuration (star-delta).
    - check the motor load.
    - check the power cable connections.
    - check the power cables for short-circuit or ground fault.
    - check the length of the power cables.
    - replace power unit.

---

### 230020 <location>Power unit: Configuration not supported

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** fault cause: %1, additional information: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A configuration is requested that is not supported by the power unit.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex: xxxx = fault cause, yyyy = additional information (internal Siemens)

xxxx = 0: Autonomous operation is requested but is not supported.

xxxx = 1: The requested DRIVE-CLiQ timing is not permissible.

xxxx = 2: A PM260 has been detected with PS-ASIC version 2. This combination is not supported.

xxxx = 3: Initialization was not able to be successfully completed. It is possible that the Control Unit was withdrawn from the Power Module before or during power up.

xxxx = 4: The combination of power unit and Control Unit or Control Unit Adapter is not supported.

xxxx = 5: The higher current controller dynamic performance is not supported.

xxxx = 6: it is not permitted to operate the Motor Module with this Control Unit and firmware version.

**Remedy:**

For fault cause = 0:

If required, deactivate an active internal voltage protection (p1231).

For fault cause = 1:

Update the Control Unit firmware or change the DRIVE-CLiQ topology.

For fault cause = 2:

Replace the power unit with a PM260 with PS-ASIC version 3 (or higher).

For fault cause = 3, 4:

Insert a Control Unit or Control Unit Adapter (CUAxx) on an appropriate Power Module and perform a POWER ON for the Control Unit or the Control Unit Adapter.

For fault cause = 5:

- use a booksize format power unit.

- for a Double Motor Module operate the two drive controls with the same current controller sampling time (p0115[0]). Otherwise, the higher current controller dynamics can only be activated on the drive with the longer sampling time.

- if required, deselect the higher current controller dynamic performance (p1810.11 = 0). After deselecting the computing dead time, recalculate the controller gains (p0340 = 4). If required, optimize the speed controller.

For fault cause = 6:

- use a suitable Motor Module.

- use a Control Unit with approved firmware version.

---

**230021 <location>Power unit: Ground fault****Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY**Cause:** The power has detected a ground fault.

Possible causes:

- ground fault in the power cables.
- ground fault at the motor.
- CT defective.
- when the brake closes, this causes the hardware DC current monitoring to respond.
- short-circuit at the braking resistor.
- the closed-loop circulating current control for devices connected in parallel ( $r0108.15 = 1$ ) is either too slow or has been set too fast.

Note:

For power units, a ground fault is also emulated in  $r3113.5$ .Fault value ( $r0949$ , interpret decimal):

0:

- the hardware DC current monitoring has responded.
- short-circuit at the braking resistor.

&gt; 0:

Absolute value, total current amplitude [ $20479 = r0209 * 1.4142$ ].**Remedy:**

- check the power cable connections.
- check the motor.
- check the CT.
- check the cables and contacts of the brake connection (a wire is possibly broken).
- check the braking resistor.

For parallel switching devices ( $r0108.15 = 1$ ) the following additionally applies:

- check the ground fault monitoring thresholds ( $p0287$ ).
- check the setting of the closed-loop circulating current control ( $p7036$ ,  $p7037$ ).

See also:  $p0287$  (Ground fault monitoring shutdown threshold)

---

**230022 <location>Power unit: Monitoring U<sub>ce</sub>****Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** Fault cause: %1 bin**Reaction:** OFF2**Acknowledge:** POWER ON**Cause:** In the power unit, the monitoring of the collector-emitter voltage ( $U_{ce}$ ) of the semiconductor has responded.

Possible causes:

- fiber-optic cable interrupted.
- power supply of the IGBT gating module missing.
- short-circuit at the power unit output.
- defective semiconductor in the power unit.

Fault value ( $r0949$ , interpret binary):

Bit 0: Short-circuit in phase U

Bit 1: Short circuit in phase V

Bit 2: Short-circuit in phase W

Bit 3: Light transmitter enable defective

Bit 4:  $U_{ce}$  group fault signal interruptedSee also:  $r0949$  (Fault value)

- Remedy:**
- check the fiber-optic cable and if required, replace.
  - check the power supply of the IGBT gating module (24 V).
  - check the power cable connections.
  - select the defective semiconductor and replace.

---

### 230024 <location>Power unit: Overtemperature thermal model

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature difference between the heat sink and chip has exceeded the permissible limit value.

- the permissible load duty cycle was not maintained.
- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

See also:r0037

- Remedy:**
- adapt the load duty cycle.
  - check whether the fan is running.
  - check the fan elements.
  - check whether the ambient temperature is in the permissible range.
  - check the motor load.
  - reduce the pulse frequency if this is higher than the rated pulse frequency.

---

### 230025 <location>Power unit: Chip overtemperature

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The chip temperature of the semiconductor has exceeded the permissible limit value.

- the permissible load duty cycle was not maintained.
- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.

Fault value (r0949, interpret decimal):

Temperature difference between the heat sink and chip [0.01 °C].

- Remedy:**
- adapt the load duty cycle.
  - check whether the fan is running.
  - check the fan elements.
  - check whether the ambient temperature is in the permissible range.
  - check the motor load.
  - reduce the pulse frequency if this is higher than the rated pulse frequency.

Notice:

This fault can only be acknowledged after the alarm threshold for alarm A05001 has been undershot.

---

### 230027 <location>Power unit: Precharging DC link time monitoring

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Enable signals: %1, Status: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit DC link was not able to be precharged within the expected time.

- 1) There is no line supply voltage connected.
- 2) The line contactor/line side switch has not been closed.
- 3) The line supply voltage is too low.
- 4) Line supply voltage incorrectly set (p0210).
- 5) The precharging resistors are overheated as there were too many precharging operations per time unit.
- 6) The precharging resistors are overheated as the DC link capacitance is too high.
- 7) The precharging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link.
- 8) The precharging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module.
- 9) The DC link has either a ground fault or a short-circuit.
- 10) The precharging circuit is possibly defective (only for chassis units).
- 11) Infeed is defective and/or fuse has ruptured in the Motor Module (only Booksize units).

Fault value (r0949, interpret binary):

yyyyxxxx hex:

yyyy = power unit state

0: Fault status (wait for OFF and fault acknowledgment).

1: Restart inhibit (wait for OFF).

2: Overvoltage condition detected -> change into the fault state.

3: Undervoltage condition detected -> change into the fault state.

4: Wait for bridging contactor to open -> change into the fault state.

5: Wait for bridging contactor to open -> change into restart inhibit.

6: Wait for bypass contactor to open

7: Commissioning.

8: Ready for precharging.

9: Precharging started, DC link voltage lower than the minimum switch-on voltage

10: Precharging, DC link voltage end of precharging still not detected

11: Wait for the end of the de-bounce time of the main contactor after precharging has been completed.

12: Precharging completed, ready for pulse enable.

13: It was detected that the STO terminal was energized at the power unit

xxxx = Missing internal enable signals, power unit (inverted bit-coded, FFFF hex -> all internal enable signals available)

Bit 0: Power supply of the IGBT gating shut down.

Bit 1: Ground fault detected.

Bit 2: Peak current intervention.

Bit 3: I2t exceeded.

Bit 4: Thermal model overtemperature calculated.

Bit 5: (heat sink, gating module, power unit) overtemperature measured.

Bit 6: Reserved.

Bit 7: Overvoltage detected.

Bit 8: Power unit has completed precharging, ready for pulse enable.

Bit 9: STO terminal missing.

Bit 10: Overcurrent detected.

Bit 11: Armature short-circuit active.

Bit 12: DRIVE-CLiQ fault active.

Bit 13: Vce fault detected, transistor de-saturated due to overcurrent/short-circuit.

Bit 14: Undervoltage detected.

| <b>Reaction:</b>      | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Cause:</b>         | Hardware current limit for phase W responded. The pulsing in this phase is inhibited for one pulse period. <ul style="list-style-type: none"><li>- closed-loop control is incorrectly parameterized.</li><li>- fault in the motor or in the power cables.</li><li>- the power cables exceed the maximum permissible length.</li><li>- motor load too high</li><li>- power unit defective.</li></ul> <b>Note:</b><br>Alarm A30031 is always output if, for a Power Module, the hardware current limiting of phase U, V or W responds. |

- Remedy:**
- check the motor data and if required, recalculate the control parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).
  - check the motor circuit configuration (star/delta).
  - check the motor load.
  - check the power cable connections.
  - check the power cables for short-circuit or ground fault.
  - check the length of the power cables.

---

### 230034 <location>Power unit: Internal overtemperature

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The alarm threshold for internal overtemperature has been reached.  
 If the temperature inside the power unit increases up to the fault threshold, then fault F30036 is triggered.

- ambient temperature might be too high.
- insufficient cooling, fan failure.

Alarm value (r2124, interpret binary):

- Bit 0 = 1: Overtemperature in the control electronics area.
- Bit 1 = 1: Overtemperature in the power electronics area.
- Bit 2 = 1: Overtemperature in the processor area.
- Bit 3 = 1: Overtemperature in the processor area.
- Bit 4 = 1: Overtemperature when the internal fan is defective.
- Bit 5 = 1: Intake air overtemperature.

- Remedy:**
- check the ambient temperature.
  - check the fan for the inside of the unit.

---

### 230035 <location>Power unit: Air intake overtemperature

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF1 (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** The air intake in the power unit has exceeded the permissible temperature limit.  
 For air-cooled power units, the temperature limit is at 55 °C.

- ambient temperature too high.
- insufficient cooling, fan failure.

Fault value (r0949, interpret decimal):  
 Temperature [0.01 °C].

- Remedy:**
- check whether the fan is running.
  - check the fan elements.
  - check whether the ambient temperature is in the permissible range.
- Notice:**  
 This fault can only be acknowledged after the alarm threshold for alarm A05002 has been undershot.

---

### 230036 <location>Power unit: Internal overtemperature

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature inside the converter has exceeded the permissible limit value.  
- insufficient cooling, fan failure.  
- overload.

- ambient temperature too high.

Fault value (r0949, interpret binary):

Bit 0 = 1: Overtemperature in the control electronics area.

Bit 1 = 1: Overtemperature in the power electronics area.

Bit 2 = 1: Overtemperature in the processor area.

Bit 3 = 1: Overtemperature in the processor area.

Bit 4 = 1: Overtemperature when the internal fan is defective.

Bit 5 = 1: Intake air overtemperature.

**Remedy:** - check the internal fan.  
- check the fan elements.  
- check whether the ambient temperature is in the permissible range.

Notice:

This fault can only be acknowledged once the permissible temperature limit minus 5 K has been fallen below.

---

**230037 <location>Power unit: Rectifier overtemperature**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature in the rectifier of the power unit has exceeded the permissible temperature limit.

- insufficient cooling, fan failure.

- overload.

- ambient temperature too high.

- line supply phase failure.

Fault value (r0949, interpret decimal):

Temperature [0.01 °C].

**Remedy:** - check whether the fan is running.  
- check the fan elements.  
- check whether the ambient temperature is in the permissible range.  
- check the motor load.  
- check the line supply phases.

Notice:

This fault can only be acknowledged after the alarm threshold for alarm A05004 has been undershot.

---

**230038 <location>Power unit: Capacitor fan monitoring**

**Drive object:** B\_INF\_828

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The capacitor fan signals a fault.

**Remedy:** Replace the capacitor fan in the power unit.

---

**230039 <location>Power unit: Failure capacitor fan**

**Drive object:** B\_INF\_828

**Message value:** %1

**Reaction:** OFF1

**Acknowledge:** IMMEDIATELY

**Cause:** The capacitor fan has failed.  
**Remedy:** Replace the capacitor fan in the power unit.

---

#### 230040 <location>Power unit: Undervolt 24 V

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** %1  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The undervoltage threshold of the 24 V power supply for the power unit was fallen below for longer than 3 ms.  
**Note:**  
- for booksize power units, the undervoltage threshold is 15 V.  
- for all other power units, the undervoltage threshold depends on the power unit, and is not displayed.  
**Fault value (r0949, interpret decimal):**  
24 V voltage [0.1 V].  
**Remedy:**  
- check the power supply of the power unit.  
- carry out a POWER ON (switch-off/switch-on) for the component.

---

#### 230040 <location>Power unit: Undervolt 24/48 V

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** Channel: %1, voltage: %2 [0.1 V]  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The undervoltage threshold of the 24 V power supply for the power unit was fallen below for longer than 3 ms.  
**Note:**  
- for booksize power units, the undervoltage threshold is 15 V.  
- for CU310-2, CUA31 and CUA32 the undervoltage threshold is 16 V.  
- for all other power units (e.g. S120M), the undervoltage threshold depends on the power unit, and is not displayed.  
**Fault value (r0949, interpret hexadecimal):**  
yyxxxx hex: yy = channel, xxxx = voltage [0.1 V]  
yy = 0: 24 V power supply  
yy = 1: 48 V power supply  
**Remedy:**  
- check the power supply of the power unit.  
- carry out a POWER ON (switch-off/switch-on) for the component.

---

#### 230041 <location>Power unit: Undervoltage 24 V alarm

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** For the power unit power supply, the lower threshold has been violated.  
**Alarm value (r2124, interpret hexadecimal):**  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- check the power supply of the power unit.  
- carry out a POWER ON (switch-off/switch-on) for the component.

---

#### 230041 <location>Power unit: Undervolt 24/48 V alarm

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** Channel: %1, voltage: %2 [0.1 V]  
**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** For the power unit power supply, the lower threshold has been violated.  
Alarm value (r2124, interpret hexadecimal):  
yyxxxx hex: yy = channel, xxxx = voltage [0.1 V]  
yy = 0: 24 V power supply  
yy = 1: 48 V power supply

**Remedy:** - check the power supply of the power unit.  
- carry out a POWER ON (switch-off/switch-on) for the component.

---

**230042 <location>Power unit: Fan has reached the maximum operating hours**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The maximum operating time of at least one fan will soon be reached, or has already been exceeded.  
Alarm value (r2124, interpret binary):  
Bit 0 = 1:  
The operating hours counter of the heat sink fan will reach the maximum operating time in 500 hours. After 500 hours has elapsed, bit 0 is cleared and bit 2 is set in the alarm value.  
Bit 1 = 1:  
The wear counter of the heat sink fan has reached 99 %. The remaining service life is 1%. After this 1% has elapsed, bit 1 is cleared and bit 2 is set in the alarm value.  
Bit 2 = 1:  
The operating hours counter of the heat sink fan has exceeded the maximum operating time - and/or the wear counter has exceeded 100%.  
Bit 8 = 1:  
The operating hours counter of the fan inside the device will reach the maximum operating time in 500 hours. After 500 hours has elapsed, bit 8 is cleared and bit 10 is set in the alarm value.  
Bit 10 = 1:  
The operating hours counter of the fan inside the device has exceeded the maximum operating time.

**Remedy:** For the fan involved, carry out the following:  
- replace the fan.  
- reset the operating hours counter (p0251, p0254).  
See also: p0251 (Power unit heat sink fan operating hours counter), p0252 (Power unit heat sink fan operating time maximum), p0254 (Operating hours counter power unit fan inside the converter), r0277 (Power unit heat sink fan wear counter)

---

**230043 <location>Power unit: Overvolt 24 V**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** For the power unit power supply, the upper threshold has been violated.  
Fault value (r0949, interpret decimal):  
24 V voltage [0.1 V].

**Remedy:** Check the power supply of the power unit.

---

**230043 <location>Power unit: Overvolt 24/48 V**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Channel: %1, voltage: %2 [0.1 V]

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** For the power unit power supply, the upper threshold has been violated.  
 Fault value (r0949, interpret hexadecimal):  
 yyxxxx hex: yy = channel, xxxx = voltage [0.1 V]  
 yy = 0: 24 V power supply  
 yy = 1: 48 V power supply

**Remedy:** Check the power supply of the power unit.

#### **230044 <location>Power unit: Overvoltage 24 V alarm**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** For the power unit power supply, the upper threshold has been violated.  
 Alarm value (r2124, interpret decimal):  
 Only for internal Siemens troubleshooting.

**Remedy:** Check the power supply of the power unit.

#### **230044 <location>Power unit: Overvolt 24/48 V alarm**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Channel: %1, voltage: %2 [0.1 V]

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** For the power unit power supply, the upper threshold has been violated.  
 Alarm value (r2124, interpret hexadecimal):  
 yyxxxx hex: yy = channel, xxxx = voltage [0.1 V]  
 yy = 0: 24 V power supply  
 yy = 1: 48 V power supply

**Remedy:** Check the power supply of the power unit.

#### **230045 <location>Power unit: Supply undervoltage**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** Power supply fault in the power unit.  
 - the voltage monitor signals an undervoltage fault on the module.  
 The following applies for CU31x:  
 - the voltage monitoring on the DAC board signals an undervoltage fault on the module.

**Remedy:**  
 - check the power supply of the power unit.  
 - carry out a POWER ON (switch-off/switch-on) for the component.  
 - replace the module if necessary.

#### **230045 <location>Power unit: Supply undervoltage**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

- Cause:** Power supply fault in the power unit.  
- the voltage monitor signals an undervoltage fault on the module.  
The following applies for CU31x:  
- the voltage monitoring on the DAC board signals an undervoltage fault on the module.  
For S120M, the following applies:  
- this message is displayed for undervoltage or overvoltage.
- Remedy:**  
- check the power supply of the power unit.  
- carry out a POWER ON (switch-off/switch-on) for the component.  
- replace the module if necessary.
- 

**230046 <location>Power unit: Undervoltage alarm**

- Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI
- Message value:** %1
- Reaction:** NONE
- Acknowledge:** NONE
- Cause:** Before the last restart, a problem occurred at the power unit power supply.  
The voltage monitor in the internal FPGA of the PSA signals an undervoltage fault on the module.  
Alarm value (r2124, interpret decimal):  
Only for internal Siemens troubleshooting.
- Remedy:**  
- check the 24 V DC voltage supply to power unit.  
- carry out a POWER ON (switch-off/switch-on) for the component.  
- replace the module if necessary.
- 

**230046 <location>Power unit: Undervoltage alarm**

- Drive object:** SERVO\_828, SERVO\_COMBI
- Message value:** %1
- Reaction:** NONE
- Acknowledge:** NONE
- Cause:** Before the last restart, a problem occurred at the power unit power supply.  
The voltage monitor in the internal FPGA of the PSA signals an undervoltage fault on the module.  
Alarm value (r2124, interpret decimal):  
Register value of the voltage fault register.
- Remedy:**  
- check the 24 V DC voltage supply to power unit.  
- carry out a POWER ON (switch-off/switch-on) for the component.  
- replace the module if necessary.
- 

**230047 <location>Cooling unit: Cooling medium flow rate too low**

- Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI
- Message value:** %1
- Reaction:** OFF2
- Acknowledge:** IMMEDIATELY
- Cause:** The flow rate of the cooling unit has fallen below the fault threshold.
- Remedy:**  
- check the feedback signals and parameter assignment (p0260 ... p0267).  
- check the coolant feed.  
- check the thermal conductivity of the coolant.  
- check the coolant concentration.
- 

**230048 <location>Power unit: fan defective**

- Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI
- Message value:** Fault cause: %1 bin

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**230052 <location>EEPROM data error**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** EEPROM data error of the power unit module.  
Fault value (r0949, interpret decimal):  
0, 2, 3, 4:  
The EEPROM data read in from the power unit module are incorrect.  
1:  
EEPROM data is not compatible to the firmware of the power unit application.  
Additional values:  
Only for internal Siemens troubleshooting.  
**Remedy:** For fault value = 0, 2, 3, 4:  
Replace the power unit module or update the EEPROM data.  
For fault value = 1:  
The following applies for CU31x and CUA31:  
Update the firmware \SIEMENS\SINAMICS\CODE\SAC\cu31xi.ufw (cua31.ufw)

---

**230053 <location>FPGA data faulty**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** POWER ON  
**Cause:** The FPGA data of the power unit are faulty. This can be caused, for example, if a firmware update is interrupted.  
**Remedy:** Replace the power unit or update of the FPGA data by updating the firmware.  
Note:  
If this fault occurs after a firmware update, then update the firmware again.

---

**230054 <location>Power unit: Undervoltage when opening the brake**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** When the brake is being opened, it is detected that the power supply voltage is less than 21.4 V  
Alarm value (r2124, interpret decimal):  
Supply voltage fault [0.1 V].  
Example:  
Alarm value = 195 --> voltage = 19.5 V  
**Remedy:** Check the 24 V voltage for stability and value.

---

**230055 <location>Power unit: Braking chopper overcurrent**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** An overcurrent condition has occurred in the braking chopper.

**Remedy:**

- check whether the braking resistor has a short circuit.
- for an external braking resistor, check whether the resistor may have been dimensioned too small.

**Note:**

The braking chopper is only enabled again at pulse enable after the fault has been acknowledged.

---

### 230057 <location>Power unit: Line asymmetry

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:**

Frequencies have been detected on the DC link voltage that would suggest line asymmetry or failure of a line phase. It is also possible that a motor phase has failed.

Fault F30011 is output if the alarm is present and at the latest after 5 minutes.

The precise duration depends on the power unit type and the particular frequencies. For booksize and chassis power units, the duration also depends on how long the alarm has been active.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- check the line phase connection.
- check the motor feeder cable connections.

If there is no phase failure of the line or motor, then line asymmetry is involved.

- reduce the power in order to avoid fault F30011.

---

### 230058 <location>Power unit: heat sink fan defective

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2 (NONE, OFF1)

**Acknowledge:** IMMEDIATELY

**Cause:**

The feedback signal from the heat sink fan signals a fault.

- fan defective.
- fan blocked.
- feedback signal inaccurate.
- fan power supply interrupted (only for r0193.13 = 1)

**Remedy:**

- check the heat sink fan and replace if necessary.
- check the fan power supply and if required switch on (only for r0193.13 = 1)
- if, for an S120 Combi, a separately driven fan with feedback signal is used, then check its wiring (X12.2 or X13.2).

**Note:**

- if a separately driven fan without feedback signal is used for an S120 Combi, instead of the feedback signal of the fan, a connection to ground must be established (X12.1/2 or X13.1/2).
- if the fault can be acknowledged, this does not necessarily mean that the cause of the fault has been resolved. It is also possible that the software switched off the fan, and therefore can no longer evaluate the feedback signal.

---

### 230059 <location>Power unit: Internal fan faulty

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:**

The internal power unit fan has failed and is possibly defective.

**Remedy:**

Check the internal fan and replace if necessary.

**Note:**

- If the fault can be acknowledged, this does not necessarily mean that the cause of the fault has been resolved. It is also possible that the software switched off the fan, and therefore can no longer evaluate the feedback signal.

---

**230060 <location>Precharge contactor state monitoring****Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** Fault cause: %1 bin**Reaction:** OFF2 (NONE, OFF1)**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** A feedback signal for the precharging contactor (ALM, SLM, BLM diode) or the line contactor (BLM thyristor) interconnected and the monitoring activated.

After switching-in/switching-out the contactor, a correct feedback signal was not received within the monitoring time set in p0255[0, 2].

Fault value (r0949, interpret binary):

Bit 0: The time set in p0255[0, 2] was exceeded when switching-in/switching-out the contactor.

Bit 1: The precharging contactor was opened while precharging or in the infeed mode (BLM thyristor).

Bit 2: The precharging contactor was switched-in in the OFF state or during infeed operation.

**Remedy:** - check the monitoring time setting (p0255[0, 2]).

- check the contactor wiring and activation.

- replace the contactor.

See also:p0255 (Power unit contactor monitoring time)

---

**230061 <location>Bridging contactor monitoring****Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** Fault cause: %1 bin**Reaction:** OFF2 (NONE, OFF1)**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** A feedback signal for the bypass contactor is interconnected and the monitoring activated.

After switching-in/switching-out the contactor, a correct feedback signal was not received within the monitoring time set in p0255[1, 3].

Fault value (r0949, interpret binary):

Bit 0: The time set in p0255[1, 3] was exceeded when switching-in/switching-out the contactor.

Bit 1: The bypass contactor was opened in operation.

Bit 2: The bypass contactor was switched-in in the OFF state or during precharging.

**Remedy:** - check the monitoring time setting (p0255[1, 3]).

- check the contactor wiring and activation.

- replace the contactor.

See also:p0255 (Power unit contactor monitoring time)

---

**230066 <location>Power unit: overtemperature, alarm capacitor air discharge****Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** The air discharged from the DC link capacitor has exceeded the alarm threshold.

- ambient temperature too high.

- insufficient cooling, fan failure.

Alarm value (r2124, interpret decimal):

Temperature when reaching the alarm threshold [0.01 °C].

Note:

If operation is unchanged, then the permissible limit value can be exceeded. In this case, fault F30067 is output and the pulses inhibited.

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.

**Note:**  
This alarm is only withdrawn after the alarm threshold has been fallen below - and the corresponding hysteresis.

---

### 230067 <location>Power unit: overtemperature, fault capacitor air discharge

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The air discharged from the DC link capacitor has exceeded the permissible limit.

- ambient temperature too high.

- insufficient cooling, fan failure.

Fault value (r0949, interpret decimal):

Temperature when reaching the limit value [0.01 °C].

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.

**Note:**

This fault can only be acknowledged after the limit value has been fallen below, and the corresponding hysteresis (5 K).

---

### 230068 <location>Power unit: undertemperature inverter heat sink

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The actual inverter heat sink temperature is below the permissible minimum value.

Possible causes:

- the power unit is being operated at an ambient temperature that lies below the permissible range.

- the temperature sensor evaluation is defective.

Fault value (r0949, interpret decimal):

Inverter heat sink temperature [0.1 °C].

**Remedy:**

- ensure that higher ambient temperatures prevail.
- replace the power unit.

---

### 230070 <location>Cycle requested by the power unit module not supported

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A cycle is requested that is not supported by the power unit.

Fault value (r0949, interpret hexadecimal):

0: The current control cycle is not supported.

1: The DRIVE-CLiQ cycle is not supported.

2: Internal timing problem (clearance between RX and TX instants too low).

3: Internal timing problem (TX instant too early).

**Remedy:** The power unit only supports the following cycles:  
62.5 µs, 125 µs, 250 µs and 500 µs  
For fault value = 0:  
Set a permitted current control cycle.  
For fault value = 1:  
Set a permitted DRIVE-CLiQ cycle.  
For fault value = 2, 3:  
Contact the manufacturer (you may have an incompatible firmware version).

---

**230071 <location>No new actual values received from the power unit**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The number of actual value telegrams from the power unit module that have failed has exceeded the permissible number.

**Remedy:** Check the interface (adjustment and locking) to the power unit module.

---

**230072 <location>Setpoints can no longer be transferred to the power unit**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The following applies for CU31x and CUA31:  
More than one setpoint telegram was not able to be transferred to the power unit module.

**Remedy:** The following applies for CU31x and CUA31:  
Check the interface (adjustment and locking) to the power unit module.

---

**230073 <location>Actual value/setpoint preprocessing no longer synchronous**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Communication with the power unit module is no longer in synchronism with the current control cycle.

**Remedy:** Wait until synchronization is re-established.

---

**230074 <location>Communication error between the Control Unit and Power Module**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>  | <p>Communications between the Control Unit (CU) and Power Module (PM) via the interface no longer possible. The CU may have been withdrawn or is incorrectly inserted.</p> <p>Fault value (r0949, interpret hexadecimal):</p> <p>0 hex:</p> <ul style="list-style-type: none"> <li>- a Control Unit with external 24 V supply was withdrawn from the Power Module during operation.</li> <li>- with the Power Module switched off, the external 24 V supply for the Control Unit was interrupted for some time.</li> </ul> <p>1 hex:</p> <p>The Control Unit was withdrawn from the Power Module during operation, although the encoderless safe motion monitoring functions are enabled. This is not supported. After re-inserting the Control Unit in operation, communications to the Power Module no longer possible.</p> <p>20A hex:</p> <p>The Control Unit was inserted on a Power Module, which has another code number.</p> <p>20B hex:</p> <p>The Control Unit was inserted on a Power Module, which although it has the same code number, has a different serial number.</p> <p>601 hex:</p> <p>The Control Unit was inserted on a Power Module, whose power/performance class (chassis unit) is not supported.</p> |
| <b>Remedy:</b> | <p>Reinsert the Control Unit (CU) or the Control Unit Adapter (CUAxx) onto the original Power Module and continue operation. If required, carry out a POWER ON for the CU and/or the CUA.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Cause:</b>         | <p>The energy absorbed by the internal braking resistor has exceeded the alarm threshold of 80 %. If the power unit is still operated in the generator mode, then this can reach the shutdown threshold. To avoid overheating of the braking resistor, use of the braking resistor is inhibited and alarm A30077 is output.</p> <p>Alarm value (r2124, interpret decimal):</p> <p>Energy absorbed by the braking resistor [Ws].</p> |
| <b>Remedy:</b>        | <p>Reduce the power when generating.</p> <p>Note:</p> <p>For a DC link coupling, the generating power of all of the coupled power units must be taken into consideration.</p>                                                                                                                                                                                                                                                       |

---

**230077 <location>Power unit: thermal overload internal braking resistor****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** The internal braking resistor is thermally overloaded. This is the reason that its use was inhibited.

Alarm value (r2124, interpret decimal):

Energy absorbed by the braking resistor [Ws].

**Remedy:** Reduce the power when generating.

Note:

- once the internal braking resistor has thermally recovered, it is enabled for further use.

- for a DC link coupling, the generating power of all the coupled power units must be taken into consideration.

---

**230078 <location>Power unit: defective fan or line reactor has overheated****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** -**Reaction:** OFF2**Acknowledge:** IMMEDIATELY**Cause:** The temperature monitoring of the internal braking resistor or the line reactor has responded. In addition to the OFF2 response, the use of the internal braking resistor was inhibited.

Note:

- an overtemperature condition of the internal braking resistor can only be initiated as a result of a defective fan.

- an overtemperature condition of the line reactor can occur when a DC link coupling is used – and if the power when motoring, which is fed into the DC link - is not evenly distributed across the rectifiers of the power units.

**Remedy:** - check the converter fan and replace if necessary.

- reduce the motoring power.

---

**230079 <location>Power unit: referred to the supply voltage, the DC link voltage is too high****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** The alarm is output if the following conditions are simultaneously satisfied:

1. The device supply voltage (p0210) was reduced.

2. A DC link voltage is present, which is too high when referred to the new supply voltage.

DC link precharging cannot be completed as this could place some converter components at risk.

Alarm value (r2124, interpret decimal):

Voltage value to which the DC link voltage must, in the meantime, be reduced in order to complete precharging [V].

See also: p0210 (Drive unit line supply voltage)

**Remedy:** As a minimum, reduce the DC link voltage to the voltage specified in the alarm value.

Note:

The alarm is automatically withdrawn if the DC link voltage drops below the voltage specified in the alarm value.

Fault F07802 is output if an attempt is made to enable the pulses even though an alarm is active.

---

**230080 <location>Power unit: Current increasing too quickly****Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** Fault cause: %1 bin**Reaction:** OFF2**Acknowledge:** IMMEDIATELY

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

---

|                       |                                                                      |
|-----------------------|----------------------------------------------------------------------|
| <b>230081</b>         | <b>&lt;location&gt;Power unit: Switching operations too frequent</b> |
| <b>Drive object:</b>  | A_INF_828, B_INF_828, S_INF_828, S_INF_COMBI, SERVO_828, SERVO_COMBI |
| <b>Message value:</b> | Fault cause: %1 bin                                                  |
| <b>Reaction:</b>      | OFF2                                                                 |
| <b>Acknowledge:</b>   | IMMEDIATELY                                                          |

- Cause:**
- The power unit has executed too many switching operations for current limitation.
  - closed-loop control is incorrectly parameterized.
  - motor has a short-circuit or fault to ground (frame).
  - U/f operation: Up ramp set too low.
  - U/f operation: rated current of motor much greater than that of power unit.
  - infeed: High discharge and post-charging currents for line voltage dip.
  - infeed: High post-charging currents for overload when motoring and DC link voltage dip.
  - infeed: Short-circuit currents at switch-on as there is no commutating reactor.
  - power cables are not correctly connected.
  - power cables exceed the maximum permissible length.
  - power unit defective.

Additional causes for a parallel switching device (r0108.15 = 1):

- a power unit has tripped (switched off) due to a ground fault.
- the closed-loop circulating current control is either too slow or has been set too fast.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.

Bit 1: Phase V.

Bit 2: Phase W.

- Remedy:**
- check the motor data - if required, carry out commissioning.
  - check the motor circuit configuration (star-delta)
  - U/f operation: Increase up ramp.
  - U/f operation: Check assignment of rated currents of motor and power unit.
  - infeed: Check the line supply quality.
  - infeed: Reduce the motor load.
  - infeed: Correct connection of the line reactor.
  - check the power cable connections.
  - check the power cables for short-circuit or ground fault.
  - check the length of the power cables.
  - replace power unit.
- For a parallel switching device (r0108.15 = 1) the following additionally applies:
- check the ground fault monitoring thresholds (p0287).
  - check the setting of the closed-loop circulating current control (p7036, p7037).

**230082 <location>Power unit: cooling medium flow rate too low alarm threshold**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The flow rate is too low, and has fallen below the specified alarm threshold. If the flow rate is still too low after the specified time has expired, then fault F30083 is output.

- Remedy:**
- check the coolant flow rate.
  - check the thermal conductivity of the coolant.
  - check the coolant concentration.

---

**230083 <location>Power unit: cooling medium flow rate too low fault threshold**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The flow rate is too low, and has fallen below the specified fault threshold.

**Remedy:**

- check the coolant flow rate.
- check the thermal conductivity of the coolant.
- check the coolant concentration.

---

**230086 <location>Power unit: coolant temperature has exceeded the alarm threshold**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The coolant temperature has exceeded the specified alarm threshold.  
If the coolant temperature increases up to the specified fault threshold, then fault F30087 is output.  
Alarm value (r2124, interpret decimal):  
Coolant temperature.

**Remedy:** Check the cooling system and the ambient conditions.

---

**230087 <location>Power unit: coolant temperature has exceeded the fault threshold**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The coolant temperature has exceeded the specified fault threshold.  
Fault value (r0949, interpret decimal):  
Coolant temperature.

**Remedy:** Check the cooling system and the ambient conditions.

---

**230105 <location>PU: Actual value sensing fault**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** At least one incorrect actual value channel was detected on the Power Stack Adapter (PSA).  
The incorrect actual value channels are displayed in the following diagnostic parameters.

**Remedy:** Evaluate the diagnostic parameters.  
If the actual value channel is incorrect, check the components and if required, replace.

---

**230314 <location>Power unit: 24 V power supply overloaded by PM**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The 24 V power supply through the Power Module (PM) is overloaded.  
An external 24 V power supply via X124 on the Control Unit is not connected.

**Remedy:** Connect an external 24 V power supply via X124 at the Control Unit.

---

**230315 <location>Power unit: 24 V power supply overloaded by PM**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The 24 V power supply through the Power Module (PM) is overloaded.  
An external 24 V power supply via X124 on the Control Unit is not connected.

**Remedy:** Connect an external 24 V power supply via X124 at the Control Unit.

---

### 230502 <location>Power unit: DC link overvoltage

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The power unit has detected overvoltage in the DC link on a pulse inhibit.  
- device supply voltage too high.  
- line reactor incorrectly dimensioned.  
Alarm value (r0949, interpret decimal):  
DC link voltage [1 bit = 100 mV].  
See also:r0070

**Remedy:** - check the device supply voltage (p0210).  
- check the dimensioning of the line reactor.  
See also:p0210 (Drive unit line supply voltage)

---

### 230600 <location>SI P2: STOP A initiated

**Drive object:** HLA\_828

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive-integrated "Safety Integrated" function in monitoring channel 2 has detected a fault and initiated a STOP A (STO via the safety switch-off signal path of monitoring channel 2).  
- forced checking procedure (test stop) of the safety switch-off signal path of monitoring channel 2 unsuccessful.  
- subsequent response to fault F30611 (defect in a monitoring channel).  
Fault value (r0949, interpret decimal):  
0: stop request from the Control Unit.  
1005: STO active although STO not selected and there is no internal STOP A present.  
1010: STO inactive although STO is selected or an internal STOP A is present.  
9999: Subsequent response to fault F30611.

**Remedy:** - select Safe Torque Off and deselect again.  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- replace Hydraulic Module involved.  
For fault value = 9999:  
- carry out diagnostics for fault F30611.  
Note:  
CU: Control Unit  
SI: Safety Integrated  
STO: Safe Torque Off / SH: Safe standstill

## 230611 <location>SI P2: Defect in a monitoring channel

|                       |                         |
|-----------------------|-------------------------|
| <b>Drive object:</b>  | HLA_828                 |
| <b>Message value:</b> | %1                      |
| <b>Reaction:</b>      | NONE (OFF1, OFF2, OFF3) |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)  |

- Cause:** The drive-integrated "Safety Integrated" function on processor 2 has detected a fault in the data cross-check between the two monitoring channels and has initiated a STOP F.
- As a result of this fault, after the parameterized transition has expired (p9858), fault F30600 is output (SI MM: STOP A initiated).
- Fault value (r0949, interpret decimal):
- 0: Stop request from the other monitoring channel.
  - 1 ... 999:  
Number of the cross-compared data that resulted in this fault. This number is also displayed in r9895.
  - 1: SI monitoring clock cycle (r9780, r9880).
  - 2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits.
  - 3: SI SGE changeover discrepancy time (p9650, p9850).
  - 4: SI transition period STOP F to STOP A (p9658, p9858).
  - 6: SI Motion enable, safety-relevant functions (p9501, internal value).
  - 7: SI delay time of STO for Safe Stop 1 (p9652, p9852).
  - 8: SI PROFIsafe address (p9610, p9810).
  - 9: SI debounce time for STO/SBC/SS1 (p9651, p9851).
  - 10: SI delay time for initiating STO for ESR (p9697, p9897).
  - 11: SI HLA shutoff valve feedback signal contact configuration (p9626, p9826).
  - 12: SI HLA shutoff valve wait time switch-on (p9625[0], p9825[0]).
  - 13: SI HLA shutoff valve wait time switch-off (p9625[1], p9825[1]).
  - 14: SI PROFIsafe telegram selection (p9611, p9811).
  - 15: SI PROFIsafe bus failure response (p9612, p9812).
  - 1000: Watchdog timer has expired.
- Within the time of approx. 5 x p9650, alternatively, the following was defined:
- the signal at terminal STO of the Hydraulic Module continually changed with time intervals less than or equal to the discrepancy time (p9650/p9850).
  - via PROFIsafe/TM54F, STO (also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).
- 1001, 1002: Initialization error, change timer / check timer.
  - 1950: Module temperature outside the permissible temperature range.
  - 1951: Module temperature not plausible.
  - 2000: Status of the STO selection for both monitoring channels different.
  - 2001: Feedback signal of STO shutdown for both monitoring channels different.
  - 2002: Status of the delay timer SS1 for both monitoring channels different (status of the timer in p9650/p9850).
  - 2003: Status of the STO terminal for both monitoring channels different.
  - 6000 ... 6999:  
Error in the PROFIsafe control.
- For these fault values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9812) is parameterized, the transfer of the Failsafe Values is delayed.
- The significance of the individual message values is described in safety message C01611.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 230611 <location>SI P2: Defect in a monitoring channel

|                       |                         |
|-----------------------|-------------------------|
| <b>Drive object:</b>  | SERVO_828, SERVO_COMBI  |
| <b>Message value:</b> | %1                      |
| <b>Reaction:</b>      | NONE (OFF1, OFF2, OFF3) |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)  |

**Cause:** The drive-integrated "Safety Integrated" function on processor 2 has detected a fault in the data cross-check between the two monitoring channels and has initiated a STOP F.

As a result of this fault, after the parameterized transition has expired (p9858), fault F30600 is output (SI MM: STOP A initiated).

Fault value (r0949, interpret decimal):

0: Stop request from another monitoring channel.

1 ... 999:

Number of the cross-compared data that resulted in this fault. This number is also displayed in r9895.

1: SI monitoring clock cycle (r9780, r9880).

2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits.

3: SI SGE changeover discrepancy time (p9650, p9850).

4: SI transition period STOP F to STOP A (p9658, p9858).

5: SI enable Safe Brake Control (p9602, p9802).

6: SI Motion enable, safety-relevant functions (p9501, internal value).

7: SI delay time of STO for Safe Stop 1 (p9652, p9852).

8: SI PROFIsafe address (p9610, p9810).

9: SI debounce time for STO/SBC/SS1 (p9651, p9851).

10: SI delay time for initiating STO for ESR (p9697, p9897).

11: SI Safe Brake Adapter mode, BICO interconnection (p9621, p9821).

12: SI Safe Brake Adapter relay ON time (p9622[0], p9822[0]).

13: SI Safe Brake Adapter relay OFF time (p9622[1], p9822[1]).

14: SI PROFIsafe telegram selection (p9611, p9811).

15: SI PROFIsafe bus failure response (p9612, p9812).

1000: Watchdog timer has expired.

Within the time of approx. 5 x p9650, alternatively, the following was defined:

- the signal at terminal EP of the Motor Module continually changed with time intervals less than or equal to the discrepancy time (p9650/p9850).
- via PROFIsafe/TM54F, STO (also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).
- safe pulse cancellation (r9723.9 - also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).

1001, 1002: Initialization error, change timer / check timer.

1950: Module temperature outside the permissible temperature range.

1951: Module temperature not plausible.

1952: S120M: hardware access fault.

1953: Module temperature outside the permissible temperature range.

1954: Module temperature not plausible.

2000: Status of the STO selection for both monitoring channels different.

2001: Feedback signal of STO shutdown for both monitoring channels different. This value can also subsequently occur as a result of other faults.

2002: Status of the delay timer SS1 for both monitoring channels different (status of the timer in p9650/p9850).

2003: Status of the STO terminal for both monitoring channels different.

2004: Forced checking procedure of the switch-off signal path of the second channel unsuccessful.

2005: Forced checking procedure of the switch-off signal path of the second channel unsuccessful.

6000 ... 6999:

Error in the PROFIsafe control.

For these fault values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9812) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety message C01611.

**Remedy:**

For fault value = 1 ... 5 and 7 ... 999:

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1000:

- check the wiring of the safety-relevant inputs (SGE) on the Control Unit (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the wiring of the failsafe inputs at the TM54F (contact problems).
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1950:

- operate the module in the permissible range.
- check the module fan, replace the Motor Module involved.

For fault value = 1951:

- operate the module in the permissible range.
- replace the Motor Module involved.

For fault value = 1952:

- replace the Motor Module involved.

For fault value = 2000, 2001, 2002, 2003:

- check the discrepancy time, and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check why STO was selected in r9872. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.

For fault value 2004, 2005:

- replace the Motor Module involved.
- replace the Motor Module involved.
- diagnose the other active faults and resolve the causes.

Note:

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

For fault value = 6000 ... 6999:

Refer to the description of the message values in safety message C01611.

Note:

CU: Control Unit

EP: Enable Pulses (pulse enable)

ESR: Extended Stop and Retract

MM: Motor Module

SGE: Safety-relevant input

SI: Safety Integrated

SMM: Safe Motion Monitoring

SS1: Safe Stop 1

STO: Safe Torque Off / SH: Safe standstill

---

**230620 <location>SI P2: Safe Torque Off active****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** -**Reaction:** NONE**Acknowledge:** NONE**Cause:** The "Safe Torque Off" (STO) function of the basic functions has been selected in monitoring channel 2 using the input terminal and is active.**Note:**

- this message does not result in a safety stop response.
- this message is not output when STO is selected using the Extended Functions.

**Remedy:** Not necessary.**Note:**

MM: Motor Module

SI: Safety Integrated

STO: Safe Torque Off / SH: Safe standstill

---

**230621 <location>SI P2: Safe Stop 1 active****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** -**Reaction:** NONE**Acknowledge:** NONE**Cause:** The "Safe Stop 1" function (SS1) was selected in monitoring channel 2 and is active.**Note:**

This message does not result in a safety stop response.

**Remedy:** Not necessary.**Note:**

MM: Motor Module

SI: Safety Integrated

SS1: Safe Stop 1

---

**230625 <location>SI P2: Sign-of-life error in safety data****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** The drive-integrated "Safety Integrated" function in monitoring channel 2 has detected an error in the sign-of-life of the safety data between the two monitoring channels and initiated a STOP A.

- there is either a DRIVE-CLiQ communication error or communication has failed.
- a time slice overflow of the safety software has occurred.
- the enable of the safety functions in both monitoring channels is inconsistent (p9601 = 0, p9801 <> 0).

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

- Remedy:**
- select Safe Torque Off and deselect again.
  - carry out a POWER ON (switch-off/switch-on) for all components.
  - check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
  - deselect all drive functions that are not absolutely necessary.
  - reduce the number of drives.
  - check the electrical cabinet design and cable routing for EMC compliance
  - check the enable of the safety functions for both of the monitoring channels and if required, correct (p9601, p9801).
- Note:**
- P2: processor 2
- SI: Safety Integrated

| <b>Cause:</b>         | <p>The "Safety Integrated" function integrated in the drive on the Motor Module (MM) has detected a brake control error and initiated a STOP A.</p> <ul style="list-style-type: none"> <li>- motor cable is not shielded correctly.</li> <li>- defect in the brake control circuit of the Motor Module.</li> </ul> <p>Fault value (r0949, interpret decimal):</p> <p>10:</p> <p>Fault in "open holding brake" operation.</p> <ul style="list-style-type: none"> <li>- parameter p1278 incorrectly set.</li> <li>- no brake connected or wire breakage (check whether brake releases for p1278 = 1 and p9602/p9802 = 0 (SBC deactivated)).</li> <li>- ground fault in brake cable.</li> </ul> <p>30:</p> <p>Fault in "close holding brake" operation.</p> <ul style="list-style-type: none"> <li>- no brake connected or wire breakage (check whether brake releases for p1278 = 1 and p9602/p9802 = 0 (SBC deactivated)).</li> <li>- short-circuit in brake winding.</li> </ul> <p>40:</p> <p>Fault in "brake closed" state.</p> <p>60, 70:</p> <p>Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control).</p> <p>81: Safe Brake Adapter: Fault in "brake closed" state.</p> <p>82: Safe Brake Adapter: Fault for the operation "open brake".</p> <p>83: Safe Brake Adapter: Fault for the operation "close brake".</p> <p>84, 85:</p> <p>Safe Brake Adapter:</p> <p>Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control).</p> <p>90:</p> <p>Brake released for service purposes (X4).</p> <p>91:</p> <p>Fault in "open holding brake" operation.</p> <ul style="list-style-type: none"> <li>- no brake connected or wire breakage (check whether brake releases for p1278 = 1 and p9602/p9802 = 0 (SBC deactivated)).</li> </ul> |

**Remedy:**

- check parameter p1278 (for SBC, only p1278 = 0 is permissible).
- select Safe Torque Off and deselect again.
- check the motor holding brake connection.
- check the function of the motor holding brake.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).
- replace the Motor Module involved.

Operation with Safe Brake Module or Safe Brake Adapter:

- check the Safe Brake Module or Safe Brake Adapter connection.
- Replace the Safe Brake Module or Safe Brake Adapter.

Note:

MM: Motor Module  
SBC: Safe Brake Control  
SI: Safety Integrated

| <b>Cause:</b>         | For mounting purposes, the brake is supplied with voltage via terminal X4.1 and released. |
| <b>Remedy:</b>        | If required, again remove the power supply at X4.1.                                       |

| <b>Reaction:</b>      | NONE                                                                                                                                                                                                                                                                                                                                  |
| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                  |
| <b>Cause:</b>         | <p>The Hydraulic Module has detected a communications error with the higher-level control or the TM54F to transfer the safety-relevant information.</p> <p>Note:</p> <p>This fault results in a STOP A that can be acknowledged.</p> <p>Alarm value (r2124, interpret decimal):</p> <p>Only for internal Siemens troubleshooting.</p> |

**Remedy:** For the higher-level control, the following applies:

- check the PROFIsafe address in the higher-level control and Hydraulic Module and if required, align.
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

For TM54F, carry out the following steps:

- start the copy function for the node identifier (p9700 = 1D hex).
- acknowledge hardware CRC (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

For a parallel connection, the following applies:

- check the PROFIsafe address in both monitoring channels and if required, align.
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

The following generally applies:

- upgrade the Hydraulic Module software.

**Note:**  
MM: Motor Module  
SI: Safety Integrated  
See also: p9810 (SI PROFIsafe address (Motor Module))

---

**230640 <location>SI P2: Fault in the switch-off signal path of the second channel**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The Motor Module has detected a communication error with the higher-level control or the TM54F to transfer the safety-relevant information or there is a communication error between Motor Modules connected in parallel.

**Note:**

This fault results in a STOP A that can be acknowledged.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:** For the higher-level control, the following applies:

- check the PROFIsafe address in the higher-level control and Motor Modules and if required, align.
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

For TM54F, carry out the following steps:

- start the copy function for the node identifier (p9700 = 1D hex).
- acknowledge hardware CRC (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

For a parallel connection, the following applies:

- check the PROFIsafe address in both monitoring channels and if required, align.
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

The following generally applies:

- upgrade the Motor Module software.

**Note:**  
MM: Motor Module

**230649 <location>SI P2: Internal software error****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** An internal error in the Safety Integrated software in monitoring channel 2 has occurred.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- re-commission the Safety Integrated Function and carry out a POWER ON.
- upgrade the Motor Module/Hydraulic Module software.
- contact Technical Support.
- replace the Motor Module/Hydraulic Module.

Note:

MM: Motor Module

SI: Safety Integrated

**230650 <location>SI P2: Acceptance test required****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** The "Safety Integrated" function on monitoring channel 2 requires an acceptance test.

Note:

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

130: Safety parameters for monitoring channel 2 not available.

Note:

This fault value is always output when Safety Integrated is commissioned for the first time.

1000: Reference and actual checksum in monitoring channel 2 are not identical (booting).

- as a result of the changed current controller sampling time (p0115[0]), the clock cycle time for the Safety Integrated Basic Functions (r9880) was adapted.

- safety parameters set offline and loaded into the Control Unit.

- a download was made to the SINAMICS, whose firmware versions in monitoring channel 2 did not correspond to the latest version. The request to switch off the DRIVE-CLiQ component A1007 was present after the download.

- at least one checksum-checked piece of data is defective.

2000: Reference and actual checksum in monitoring channel 2 are not identical (commissioning mode).

- reference checksum on monitoring channel 2 incorrectly entered (p9899 not equal to r9898).

2003: Acceptance test is required as a safety parameter has been changed.

2005: The safety logbook has identified that the safety checksums have changed. An acceptance test is required.

3003: Acceptance test is required as a hardware-related safety parameter has been changed.

9999: Subsequent response of another safety-related fault that occurred when booting that requires an acceptance test.

**Remedy:**

For fault value = 130:

- carry out safety commissioning routine.

For fault value = 1000:

- check the Safety Integrated Basic Functions (r9880) and adapt the reference checksum (p9899).
- again carry out safety commissioning routine.
- Using STARTER, activate the safety parameters for the drive involved (change settings, copy parameters, activate settings).
- switch off and switch on the drive unit and DRIVE-CLiQ components. If A30650 is still present, repeat the download.
- replace the memory card or Control Unit.

For fault value = 2000:

- check the safety parameters on monitoring channel 2 and adapt the reference checksum (p9899).

For fault value = 2003, 2005:

- carry out an acceptance test and generate an acceptance report.

The procedure when carrying out an acceptance test as well as an example of the acceptance report are provided in the following literature:

SINAMICS S120 Function Manual Safety Integrated

For fault value = 3003:

- carry out the function checks for the modified hardware and generate an acceptance report.

The procedure when carrying out an acceptance test as well as an example of the acceptance report are provided in the following literature:

SINAMICS S120 Function Manual Safety Integrated

For fault value = 9999:

- carry out diagnostics for the other safety-related fault that is present.

**Note:**

MM: Motor Module

SI: Safety Integrated

See also: p9799 (SI reference checksum SI parameters (Control Unit)), p9899 (SI reference checksum SI parameters (Motor Module))

| <b>Reaction:</b>      | OFF2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Cause:</b>         | When accessing the Safety Integrated parameters for monitoring channel 2 in the non-volatile memory, an error has occurred.<br>Note:<br>This fault results in a STOP A that can be acknowledged.<br>Fault value (r0949, interpret decimal):<br>129:<br>- safety parameters for monitoring channel 2 corrupted.<br>- drive with enabled safety functions was possibly copied offline using the commissioning tool and the project downloaded.<br>131: Internal software error on the Control Unit.<br>255: Internal Motor Module/Hydraulic Module software error. |

**Remedy:**

- re-commission the safety functions.
- upgrade the Control Unit software.
- upgrade the Motor Module/Hydraulic Module software.
- replace the memory card or Control Unit.

For fault value = 129:

- activate the safety commissioning mode (p0010 = 95).
- adapt the PROFIsafe address (p9610).
- start the copy function for SI parameters (p9700 = D0 hex).
- acknowledge data change (p9701 = DC hex).
- exit the safety commissioning mode (p0010 = 0).
- save all parameters (p0977 = 1 or "copy RAM to ROM").
- carry out a POWER ON (switch-off/switch-on) for all components.

**Note:**  
MM: Motor Module  
SI: Safety Integrated

---

**230657**      **<location>SI P2: PROFIsafe telegram number invalid**

**Drive object:**    HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:**   -

**Reaction:**        OFF2

**Acknowledge:**    POWER ON

**Cause:**           The PROFIsafe telegram number set in p9811 is not valid.  
When PROFIsafe is enabled (p9801.3 = 1), then a telegram number greater than zero must be entered in p9811.

**Note:**  
This fault does not result in a safety stop response.  
See also: p9611 (SI PROFIsafe telegram selection (Control Unit)), p60022 (PROFIsafe telegram selection)

**Remedy:**          Check the telegram number setting (p9811).

---

**230659**      **<location>SI P2: Write request for parameter rejected**

**Drive object:**    HLA\_828

**Message value:**   %1

**Reaction:**        OFF2

**Acknowledge:**    IMMEDIATELY (POWER ON)

**Cause:**           The write request for one or several Safety Integrated parameters in monitoring channel 2 was rejected.

**Note:**  
This fault does not result in a safety stop response.  
Fault value (r0949, interpret decimal):

- 10: An attempt was made to enable the STO function although this cannot be supported.
- 13: An attempt was made to enable the SS1 function although this cannot be supported.
- 14: An attempt was made to enable the safe motion monitoring function with the higher-level control, although this cannot be supported.
- 15: An attempt was made to enable the motion monitoring functions integrated in the drive although these cannot be supported.
- 16: An attempt was made to enable the PROFIsafe communication - although this cannot be supported or the version of the PROFIsafe driver used on both monitoring channels is different.
- 18: An attempt was made to enable the PROFIsafe function for Basic Functions although this cannot be supported.
- 19: For ESR, an attempt was made to enable the delay for pulse suppression, although this cannot be supported.
- 27: An attempt was made to activate the Basic Functions by controlling via TM54F although this is not supported.
- 29: An attempt was made to parameterize the fault response for PROFIsafe failure to STOP B although this cannot be supported.
- 33: Safety functions without selection are not supported (p9601.5, p9801.5).

See also: r9771 (SI common functions (Control Unit)), r9871 (SI common functions (Motor Module))

**Remedy:**

For fault value = 10, 13, 14, 15, 16, 18, 19:

- check whether there are faults in the safety function alignment between the two monitoring channels (F01655, F30655) and if required, carry out diagnostics for the faults involved.
- use a Hydraulic Module that supports the required function.
- upgrade the Hydraulic Module software.
- upgrade the Control Unit software.

For fault value = 29:

- check whether p9612 and p9812 are set; if required, correct the settings.
- use a Hydraulic Module that supports the required function.
- upgrade the Hydraulic Module software.
- upgrade the Control Unit software.

Note:

SI: Safety Integrated

SS1: Safe Stop 1 (corresponds to Stop Category 1 acc. to EN60204)

STO: Safe Torque Off / SH: Safe standstill

---

## 230659 <location>SI P2: Write request for parameter rejected

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The write request for one or several Safety Integrated parameters in monitoring channel 2 was rejected.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

10: An attempt was made to enable the STO function although this cannot be supported.

11: An attempt was made to enable the SBC function although this cannot be supported.

13: An attempt was made to enable the SS1 function although this cannot be supported.

14: An attempt was made to enable the safe motion monitoring function with the higher-level control, although this cannot be supported.

15: An attempt was made to enable the motion monitoring functions integrated in the drive although these cannot be supported.

16: An attempt was made to enable the PROFIsafe communication - although this cannot be supported or the version of the PROFIsafe driver used on both monitoring channels is different.

18: An attempt was made to enable the PROFIsafe function for Basic Functions although this cannot be supported.

19: For ESR, an attempt was made to enable the delay for pulse suppression, although this cannot be supported.

27: An attempt was made to activate the Basic Functions by controlling via TM54F although this is not supported.

28: An attempt was made to enable the "STO via terminals at the Power Module" function although this cannot be supported.

29: An attempt was made to parameterize the STOP B as stop response for PROFIsafe failure, although this cannot be supported.

See also: r9771 (SI common functions (Control Unit)), r9871 (SI common functions (Motor Module))

**Remedy:** For fault value = 10, 11, 13, 14, 15, 16, 18, 19, 27:

- check whether there are faults in the safety function alignment between the two monitoring channels (F01655, F30655) and if required, carry out diagnostics for the faults involved.
- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 28:

- use the power unit with the feature "STO via terminals at the Power Module".

For fault value = 29:

- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.
- If required, parameterize the stop response for PROFIsafe failure to STOP A (p9612 = p9812 = 0).

**Note:**

CU: Control Unit  
ESR: Extended Stop and Retract  
MM: Motor Module  
SBC: Safe Brake Control  
SI: Safety Integrated  
SS1: Safe Stop 1  
STO: Safe Torque Off / SH: Safe standstill

**230664 <location>Error while booting**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** An error has occurred during booting.  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- upgrade firmware to later version.
- contact Technical Support.

---

**230665 <location>SI P2: System is defective**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A system defect was detected before the last boot or in the actual one. The system might have been rebooted (reset).  
Fault value (r0949, interpret hexadecimal):  
2 hex:  

- parameters p9500 and p9300 are not the same (if Safety message C30711 is displayed at the same time).

  
200000 hex, 400000 hex:  

- fault in the actual booting/operation.

  
Additional values:  

- defect before the last time that the system booted.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- upgrade firmware to later version.
- contact Technical Support.

For fault value = 2:

- check parameters p9500 and p9300 to see if they are the same (if Safety message C30711 is displayed at the same time).

For fault value = 400000 hex:

- ensure that the Control Unit is connected to the Power Module.

---

### **230666 <location>SI Motion P2: Steady-state (static) 1 signal at the F-DI for safe acknowledgment**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A logical 1 signal is present at the F-DI configured in p10106 for more than 10 seconds.  
If, at the F-DI no acknowledgment was performed for safe acknowledgment, then a steady-state logical and 0 signal must be present. This avoids unintentional safety-relevant acknowledgment (or the "Internal Event Acknowledge" signal) if a wire breaks or one of the two digital inputs bounces.

**Remedy:** Set the failsafe digital input (F-DI) to a logical 0 signal (p10106).

Note:

F-DI: Failsafe Digital Input

---

### **230672 <location>SI P2: Control Unit software incompatible**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The existing Control Unit software does not support the safe drive-based motion monitoring function.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- check whether there are faults in the safety function alignment between the two monitoring channels (F01655, F30655) and if required, carry out diagnostics for the faults involved.

- use a Control Unit that supports the safe motion monitoring function.

- upgrade the Control Unit software.

Note:

SI: Safety Integrated

**Cause:** The parameter cannot be parameterized with this value.

**Note:**  
 This message does not result in a safety stop response.  
 Fault value (r0949, interpret decimal):  
 yyyyxxxx dec: yyyy = supplementary information, xxxx = parameter  
 yyyy = 0:  
 No additional information available.  
 xxxx = 9301:  
 It is not permissible to enable the function "n < nx hysteresis and filtering" (p9301.16) in conjunction with the function "Extended functions without selection" (p9801.5).  
 xxxx = 9301 and yyyy = 8:  
 Referencing via SCC (p9301.27 = 1) is enabled without enabling absolute motion monitoring functions (p9301.1 or p9301.2).  
 xxxx = 9301 and yyyy = 11:  
 Safe function SS2E (p9301.18 = 1) is enabled without enabling PROFIsafe.  
 xxxx = 9301 and yyyy = 14:  
 "Synchronous safe position via PROFIsafe" is enabled (p9301.29 = 1), without enabling "Safe position via PROFIsafe" (p9301.25).  
 xxxx = 9301 and yyyy = 17:  
 "Synchronous safe position via PROFIsafe" is enabled (p9301.29 = 1) and "Safety without encoder" is enabled (p9306).  
 xxxx = 9301 and yyyy = 19:  
 SLA (p9301.20 = 1) is enabled with encoderless actual value sensing (p9306 equal to 1 or 3).  
 xxxx = 9301 and yyyy = 20:  
 SLA (p9301.20 = 1) is enabled with a 2-encoder system (p9326 not equal to 1).  
 xxxx = 9801 and yyyy = 12: SCA (p9301.28 = 1) is enabled without enabling PROFIsafe.  
 xxxx = 9334 or 9335:  
 The limit values of SLP have been set too high (absolute values).  
 xxxx = 9378:  
 SLA is enabled (p9301.20 = 1). Acceleration limit is too low (p9378). Acceleration resolution is no longer sufficient (r9790) (the minimum limit is 3x the acceleration resolution r9790[0] in v5.1 / 10x the acceleration resolution r9790[1] from v5.2 and higher).  
 xxxx = 9801 and yyyy = 1:  
 If motion monitoring functions integrated in the drive (p9801.2 = 1) and extended functions without selection (p9801.5 = 1) are activated, then PROFIsafe (p9801.3 = 1) is not possible.  
 xxxx = 9801 and yyyy = 2:  
 Extended functions without selection (p9801.5 = 1) are enabled without enabling motion monitoring functions integrated in the drive (p9801.2).  
 xxxx = 9801 and yyyy = 5:  
 Transfer of the SLS limit value via PROFIsafe (p9301.24) has been enabled, without enabling PROFIsafe.  
 xxxx = 9801 and yyyy = 6:  
 Transfer of the safe position via PROFIsafe (p9301.25) has been enabled without enabling PROFIsafe.  
 xxxx = 9801 and yyyy = 7:  
 Safe switchover of the gearbox stages (p9301.26 = 1) has been enabled without enabling PROFIsafe.  
 xxxx = 9801 and yyyy = 18:  
 SLA (p9301.20 = 1) is enabled without enabling PROFIsafe.  
 xxxx = 9801 and yyyy = 21:  
 SS2ESR (p9301.4 = 1) is enabled without enabling PROFIsafe.

**Remedy:** Correct parameter (if required, also on another monitoring channel, p9601).

**Note:**  
For different values in the two monitoring channels, start the copy function for SI parameters on the drive (p9700 = 57 hex).  
For xxxx = 9301:  
Correct parameters p9501.16 and p9301.16 or deselect the extended functions without selection (p9801.5).  
For xxxx = 9301 and yyyy = 14:  
Inhibit "Synchronous safe position via PROFIsafe" function (p9301.29 = 0), or enable "Safe position via PROFIsafe" (p9301.25).  
For xxxx = 9301 and yyyy = 17:  
Inhibit "Synchronous safe position via PROFIsafe" function (p9301.29 = 0), or set "Safety with encoder" (p9306).  
For xxxx = 9301 and yyyy = 19:  
Inhibit SLA (p9301.20) or activate actual value sensing with encoder (p9306 equal to 0 or 2).  
For xxxx = 9301 and yyyy = 20:  
Inhibit SLA (p9301.20) or activate a single-encoder system (p9326 equal to 1).  
If xxxx = 9501 and yyyy = 8:  
Inhibit referencing via SCC (p9501.27 = 1) or enable an absolute motion monitoring function (p9501.1 or p9501.2).  
For xxxx = 9501 and yyyy = 11: inhibit SS2E (p9501.18) or enable PROFIsafe.  
For xxxx = 9501 and yyyy = 12: inhibit SCA (p9501.28) or enable PROFIsafe.  
For xxxx = 9317:  
Further, p9316.0 should be checked.  
If xxxx = 9334 or 9335:  
Reduce the limit values (absolute values) of SLP.  
For xxxx = 9378:  
- observe the information in r9790.  
For xxxx = 9801:  
yyyy = 1:  
Only enable motion monitoring functions integrated in the drive (p9801.2 = 1) and extended functions without selection (p9801.5 = 1) – or only PROFIsafe (p9801.3 = 1).  
yyyy = 2:  
Enable motion monitoring functions integrated in the drive (p9801.2 = 1).  
yyyy = 5:  
To transfer the SLS limit values via PROFIsafe (p9301.24 = 1), also enable PROFIsafe (p9801.3 = 1) and motion monitoring functions integrated in the drive (p9801.2 = 1).  
yyyy = 6:  
For the safe position via PROFIsafe (p9301.25 = 1), also enable PROFIsafe (p9801.3 = 1) and motion monitoring functions integrated in the drive (p9801.2 = 1).  
yyyy = 7:  
For safe switchover of gearbox stages (p9301.26 = 1) also enable PROFIsafe (p9801.3 = 1) and motion monitoring functions integrated in the drive (p9801.2 = 1).  
yyyy = 18:  
For Safely-Limited Acceleration monitoring (p9301.20 = 1), also enable PROFIsafe (p9801.3 = 1) and the motion monitoring functions integrated in the drive (p9801.2 = 1).  
yyyy = 21:  
For Safe Stop 2 Extended Stop and Retract (p9301.4), also enable PROFIsafe (p9801.3 = 1) and motion monitoring functions integrated in the drive (p9801.2 = 1).

SS2ESR (p9301.4 = 1) is enabled without enabling PROFIsafe.

**Remedy:** Correct parameter (if required, also on another monitoring channel, p9601).

**Note:**  
For different values in the two monitoring channels, start the copy function for SI parameters on the drive (p9700 = 57 hex).  
For xxxx = 9301:  
Correct parameters p9501.16 and p9301.16 or deselect the extended functions without selection (p9801.5).  
For xxxx = 9301 and yyyy = 14:  
Inhibit "Synchronous safe position via PROFIsafe" function (p9301.29 = 0), or enable "Safe position via PROFIsafe" (p9301.25).  
For xxxx = 9301 and yyyy = 17:  
Inhibit "Synchronous safe position via PROFIsafe" function (p9301.29 = 0), or set "Safety with encoder" (p9306).  
For xxxx = 9301 and yyyy = 19:  
Inhibit SLA (p9301.20) or activate actual value sensing with encoder (p9306 equal to 0 or 2).  
For xxxx = 9301 and yyyy = 20:  
Inhibit SLA (p9301.20) or activate a single-encoder system (p9326 equal to 5).  
If xxxx = 9501 and yyyy = 8:  
Inhibit referencing via SCC (p9501.27 = 1) or enable an absolute motion monitoring function (p9501.1 or p9501.2).  
For xxxx = 9317:  
Further, p9316.0 should be checked.  
If xxxx = 9334 or 9335:  
Reduce the limit values (absolute values) of SLP.  
For xxxx = 9347:  
With hysteresis/filtering enabled (p9301.16 = 1), the following applies:  
- set parameters p9346 and p9347 according to the following rule:  $p9347 \leq 0.75 \times p9346$ ;  
- the following rule must also be adhered to when actual value synchronization (p9301.3 = 1) is enabled:  $p9347 \geq p9349$ ;  
For xxxx = 9378:  
- observe the information in r9790.  
For xxxx = 9801:  
yyyy = 1:  
Only enable motion monitoring functions integrated in the drive (p9801.2 = 1) and extended functions without selection (p9801.5 = 1) – or only PROFIsafe (p9801.3 = 1).  
yyyy = 2, 3:  
Enable motion monitoring functions integrated in the drive (p9801.2 = 1).  
yyyy = 5:  
To transfer the SLS limit values via PROFIsafe (p9301.24 = 1), also enable PROFIsafe (p9801.3 = 1) and motion monitoring functions integrated in the drive (p9801.2 = 1).  
yyyy = 6:  
For the safe position via PROFIsafe (p9301.25 = 1), also enable PROFIsafe (p9801.3 = 1) and motion monitoring functions integrated in the drive (p9801.2 = 1).  
yyyy = 7:  
For safe switchover of gearbox stages (p9301.26 = 1) also enable PROFIsafe (p9801.3 = 1) and motion monitoring functions integrated in the drive (p9801.2 = 1).  
yyyy = 18:  
For Safely-Limited Acceleration monitoring (p9301.20 = 1), also enable PROFIsafe (p9801.3 = 1) and the motion monitoring functions integrated in the drive (p9801.2 = 1).  
yyyy = 21:  
For Safe Stop 2 Extended Stop and Retract (p9301.4), also enable PROFIsafe (p9801.3 = 1) and motion monitoring functions integrated in the drive (p9801.2 = 1).

| <b>Message value:</b> | %1                                                                     |
| <b>Reaction:</b>      | OFF2                                                                   |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                 |

**Cause:** The monitoring function enabled in p9301, p9501, p9601, p9801, p9306, p9506, p9307 or p9507 is not supported in this firmware version.

**Note:**

This message does not result in a safety stop response.

Fault value (r0949, interpret decimal):

- 1: Monitoring function SLP not supported (p9301.1).
- 2: Monitoring function SCA not supported (p9301.7 and p9301.8 ... 15).
- 3: Monitoring function SLS override not supported (p9301.5).
- 4: Monitoring function external ESR activation not supported (p9301.4).
- 5: Monitoring function F-DI in PROFIsafe not supported (p9301.30).
- 6: Enable actual value synchronization not supported (p9301.3).
- 9: Monitoring function not supported by the firmware or enable bit not used.
- 12: This Control Unit does not support operation of safety functions with a higher-level control (e.g. SINUMERIK).
- 14: Monitoring function SLA and ncSI not supported.
- 24: Monitoring function SDI not supported.
- 26: Hysteresis and filtering for SSM monitoring function without an encoder not supported (p9301.16).
- 27: This hardware does not support onboard F-DI and F-DO.
- 30: The firmware version of the Motor Module is older than the version of the Control Unit.
- 33: Safety functions without selection not supported (p9601.5, p9801.5).
- 34: This module does not support safe position via PROFIsafe.
- 36: Function "SS1E" not supported.
- 39: This module or software version of the CU/MM does not support safe gearbox stage switchover (p9501.26).
- 44: this module/this software version does not support referencing via the Safety Control Channel (p9501.27).
- 45: Deactivating SOS/SLS during an external STOP A is not supported (p9301.23).
- 50: Shortening the switchover times for SOS (p9569/p9369, p9567/p9367) is not supported.
- 52: "SBR with encoder" function is not supported (p9306 = 2).
- 53: function SS2E not supported (p9301.18).
- 54: SCA function not supported (p9301.28).
- 57: "Synchronous transfer safe position via PROFIsafe" function not supported (p9301.29).
- 58: "SLA" function not supported (p9301.20).

**Remedy:** - deselect monitoring function involved (p9301, p9501, p9601, p9801, p9307, p9507, p9506, p9306).

- Upgrade the Motor Module firmware.

**Note:**

ESR: Extended Stop and Retract

F-DI: Failsafe Digital Input

SBR: Safe Brake Ramp (safe brake ramp monitoring)

SCA: Safe Cam / SN: Safe software cam

SDI: Safe Direction (safe motion direction)

SI: Safety Integrated

SLP: Safely-Limited Position / SE: Safe software limit switches

SLS: Safely-Limited Speed / SG: Safely reduced speed

SP: Safe Position

SS1E: Safe Stop 1 External (Safe Stop 1 with external stop)

SS2E: Safe Stop 2 External (Safe Stop 2 with external stop, external STOP D)

| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Cause:</b>         | The drive is stopped via a STOP A (STO via the safety switch-off signal path of the Control Unit).<br>Possible causes:<br>- stop request from the Control Unit.<br>- STO not active after parameterized time (p9357) after test stop selection.<br>- subsequent response to the message C30706 "SI Motion MM: SAM/SBR limit exceeded".<br>- subsequent response to the message C30714 "SI Motion MM: Safely-Limited Speed exceeded".<br>- subsequent response to the message C30701 "SI Motion MM: STOP B initiated".<br>- subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".<br>- subsequent response to the message C30716 "SI Motion MM: tolerance for safe motion direction exceeded". |

- Remedy:**
- remove the cause to the fault on the Control Unit.
  - check the value in p9357, if required, increase the value.
  - check the switch-off signal path of the Control Unit (check DRIVE-CLiQ communication).
  - carry out a diagnostics routine for message C30706.
  - carry out a diagnostics routine for message C30714.
  - carry out a diagnostics routine for message C30701.
  - carry out a diagnostics routine for message C30715.
  - carry out a diagnostics routine for message C30716.
  - replace the Motor Module, Power Module or Hydraulic Module.
  - replace Control Unit.

**230701 <location>SI Motion P2: STOP B initiated**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE (OFF3)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive is stopped via a STOP B (braking along the OFF3 ramp).

As a result of this fault, after the time parameterized in p9356 has expired or after the speed threshold parameterized in p9360 has been fallen below, message C30700 "SI Motion MM: STOP A initiated" is output.

Possible causes:

- stop request from the Control Unit.
- subsequent response to the message C30714 "SI Motion MM: Safely-Limited Speed exceeded".
- subsequent response to the message C30711 "SI Motion MM: Defect in a monitoring channel".
- subsequent response to the message C30707 "SI Motion MM: tolerance for safe operating stop exceeded".
- subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".
- subsequent response to the message C30716 "SI Motion MM: tolerance for safe motion direction exceeded".

- Remedy:**
- remove the cause to the fault on the Control Unit.
  - carry out a diagnostics routine for message C30714.
  - carry out a diagnostics routine for message C30711.
  - carry out a diagnostics routine for message C30707.
  - carry out a diagnostics routine for message C30715.
  - carry out a diagnostics routine for message C30716.
- This message can be acknowledged without a POWER ON as follows (safe acknowledgment):
- Terminal Module 54F (TM54F).
  - onboard F-DI (only CU310-2).
  - PROFIsafe.
  - machine control panel.

| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                                |
| <b>Cause:</b>         | <p>The actual position has distanced itself further from the target position than the standstill tolerance.</p> <p>The drive is shut down by the message C30701 "SI Motion MM: STOP B initiated".</p> |

**Remedy:**

- check whether safety faults are present and if required carry out the appropriate diagnostic routines for the particular faults.
- check whether the standstill tolerance matches the accuracy and control dynamic performance of the axis.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

**230708 <location>SI Motion P2: STOP C initiated**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** STOP2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive is stopped via a STOP C (braking along the OFF3 ramp).  
"Safe Operating Stop" (SOS) is activated after the parameterized time has expired.  
Possible causes:

- stop request from the higher-level control.
  - subsequent response to the message C30714 "SI Motion MM: Safely-Limited Speed exceeded".
  - subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".
  - subsequent response to the message C30716 "SI Motion MM: tolerance for safe motion direction exceeded".
- See also:p9552 (SI Motion transition time STOP C to SOS (SBH) (Control Unit))

**Remedy:**

- remove the cause of the fault at the control.
- carry out a diagnostics routine for messages C30714, C30715, C30716.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.

### 230710 <location>SI Motion P2: STOP E initiated

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive is stopped via a STOP E (retraction motion).  
 "Safe Operating Stop" (SOS) is activated after the parameterized time has expired.  
 Possible causes:

- stop request from the higher-level control.
- subsequent response to the message C30714 "SI Motion MM: Safely-Limited Speed exceeded".
- subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".
- subsequent response to the message C30716 "SI Motion MM: tolerance for safe motion direction exceeded".

See also: p9354 (SI Motion transition time STOP E to SOS (Motor Module)), p9554 (SI Motion transition time STOP E to SOS (SBH) (Control Unit))

**Remedy:**

- remove the cause of the fault at the control.
- carry out a diagnostics routine for messages C30714, C30715, C30716.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).

### 230711 <location>SI Motion P2: Defect in a monitoring channel

**Drive object:** HLA\_828

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

If at least one monitoring function is active, then after the parameterized timer has expired, the message C30701 "SI Motion: STOP B initiated" is output. The message is output with message value 1031 when the Sensor Module hardware is replaced. The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:

- differently parameterized cycle times (p9500/p9300, p9511/p9311).
- excessively fast cycle times (p9500/p9300, p9511/p9311).
- incorrect synchronization.

Message value (r9749, interpret decimal):

0 ... 999:

Number of the cross-compared data that resulted in this message.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.

1001: Initialization error of watchdog timer.

1002:

User agreement after the timer has expired different.

The user agreement is not consistent. After a time of 4 s has expired, the status of the user agreement is different in both monitoring channels.

1003: Reference tolerance exceeded. When the user agreement is set, the difference between the new reference point that has been determined after power up (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9344). In this case, the user agreement is withdrawn.

1004:

Plausibility error for user agreement.

1. If the user agreement has already been set, then the setting is initiated again. In this case, the user agreement is withdrawn.
2. The user agreement was set, although the axis has still not been referenced.

1005: STO already active for test stop selection.

1011: Acceptance test status between the monitoring channels differ.

1012: Plausibility violation of the encoder actual value.

1014: fault when synchronizing the SGA for the "Safe cam" function

1015: Gearbox switchover (bit 27 in PROFIsafe telegram) takes longer than 2 min.

1020: Cyc. communication failure between the monit. channels.

1021: Cyc. communication failure between the monit. channel and Sensor Module.

1023: Error in the effectiveness test in the DRIVE-CLiQ encoder.

1024: Sign-of-life error for HTL/TTL encoders.

1030: Encoder fault detected from another monitoring channel.

1031:

- data transfer error between the monitoring channel and the Sensor Module (p9526/p9326).
- the Sensor Module for the second channel was replaced.
- the encoder for the second channel has been incorrectly parameterized.

1045: CRC of the standstill position incorrect.

5000 ... 5140:

PROFIsafe message values.

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. The significance of the individual message values is described in safety message C01711 of the Control Unit.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. The significance of the individual message values is described in safety fault F01611 of the Control Unit.

7000 ... 7002:

Message values of the "Safe position via PROFIsafe" function.

See also: p9555 (SI Motion transition time STOP F to STOP B (Control Unit)), r9725 (SI Motion diagnostics STOP F)

**Remedy:**

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.
- increase the tolerance for the actual value comparison when referencing (p9344).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005:

- check the conditions for deselecting STO.

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.
- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).
- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.
- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.
- the parameterized encoder does not correspond to the connected encoder - replace the encoder.
- check the electrical cabinet design and cable routing for EMC compliance
- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

For message value = 1014:

- check the encoder actual values. If required, increase the position tolerance (p9342) and/or the cam tolerance (p9340).

For message value = 1024:

- check the communication link.
- increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (switch-off/switch-on) for all components.
- replace the hardware.

For message value = 1030:

- check the encoder connection.
- if required, replace the encoder.

For message value = 1031:

When replacing a Sensor Module, carry out the following steps:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

Adapt the encoder parameterization for the second channel as follows:

- set the encoder type (p0400).
- activate the safety commissioning mode (p0010 = 95).
- start the copy function for encoder parameters (p9700 = 46).
- exit the safety commissioning mode (p0010 = 0).
- save the parameters in a non-volatile fashion (copy RAM to ROM).
- carry out a POWER ON (switch-off/switch-on) for all components.

The following always applies:

- check the encoder connection.
- if required, replace the encoder.

For message value = 6000 ... 6999:

- the significance of the individual message values is described in safety fault F01611 of the Control Unit.

For other message values:

- the significance of the individual message values is described in safety message C01711.

Note:

This message can be acknowledged via the Terminal Module 54F (TM54F) or PROFIsafe.

See also: p9300 (SI Motion monitoring clock cycle (Motor Module)), p9500 (SI Motion monitoring clock cycle (Control Unit))

---

**230711      <location>SI Motion P2: Defect in a monitoring channel**

**Drive object:**      SERVO\_828, SERVO\_COMBI

**Message value:**    %1

**Reaction:**          NONE

**Acknowledge:**      IMMEDIATELY (POWER ON)

- Cause:** When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.
- If at least one monitoring function is active, then after the parameterized timer has expired, the message C30701 "SI Motion: STOP B initiated" is output. The message is output with message value 1031 when the Sensor Module hardware is replaced. The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:
- differently parameterized cycle times (p9500/p9300, p9511/p9311).
  - differently parameterized axis types (p9502/p9302).
  - excessively fast cycle times (p9500/p9300, p9511/p9311).
  - incorrect synchronization.
- Message value (r9749, interpret decimal):
- 0 ... 999:
- Number of the cross-compared data that resulted in this message.
- The significance of the individual message values is described in safety message C01711 of the Control Unit.
- 1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.
- 1001: Initialization error of watchdog timer.
- 1002:
- User agreement after the timer has expired different.
- The user agreement is not consistent. After a time of 4 s has expired, the status of the user agreement is different in both monitoring channels.
- 1003: Reference tolerance exceeded. When the user agreement is set, the difference between the new reference point that has been determined after power up (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9344). In this case, the user agreement is withdrawn.
- 1004:
- Plausibility error for user agreement.
1. If the user agreement has already been set, then the setting is initiated again. In this case, the user agreement is withdrawn.
  2. The user agreement was set, although the axis has still not been referenced.
- 1005:
- for safe motion monitoring functions without encoder: pulses already suppressed for test stop selection.
  - for safe motion monitoring functions with encoder: STO already active for test stop selection.
- 1011: Acceptance test status between the monitoring channels differ.
- 1012: Plausibility violation of the encoder actual value.
- 1014: fault when synchronizing the SGA for the "Safe cam" function
- 1015: Gearbox switchover (bit 27 in PROFIsafe telegram) takes longer than 2 min.
- 1020: Cyc. communication failure between the monit. channels.
- 1021: Cyc. communication failure between the monit. channel and Sensor Module.
- 1023: Error in the effectiveness test in the DRIVE-CLiQ encoder.
- 1024: Sign-of-life error for HTL/TTL encoders.
- 1030: Encoder fault detected from another monitoring channel.
- 1031:
- data transfer error between the monitoring channel and the Sensor Module (p9526/p9326).
  - the Sensor Module for the second channel was replaced.
  - the encoder for the second channel has been incorrectly parameterized.
- 1040: Pulses suppressed with active encoderless monitoring functions.
- 1041: Current absolute value too low (encoderless)
- 1042: Current/voltage plausibility error
- 1043: Too many acceleration phases
- 1044: Current actual values plausibility error.
- 1045: CRC of the standstill position incorrect.
- 5000 ... 5140:
- PROFIsafe message values.
- For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9812) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety fault F01611 of the Control Unit.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

See also: p9555 (SI Motion transition time STOP F to STOP B (Control Unit)), r9725 (SI Motion diagnostics STOP F)

**Remedy:**

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.
- increase the tolerance for the actual value comparison when referencing (p9344).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005:

- for safe motion monitoring functions without encoder: check the conditions for pulse enable.
- for safe motion monitoring functions with encoder: check the conditions for STO deselection.

Note:

For a Power Module, the test stop should always be performed when the pulses are enabled (independent of whether with encoder or without encoder).

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.
- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).
- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.
- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.
- the parameterized encoder does not correspond to the connected encoder - replace the encoder.
- check the electrical cabinet design and cable routing for EMC compliance
- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

For message value = 1014:

- check the encoder actual values. If required, increase the position tolerance (p9342) and/or the cam tolerance (p9340).

For message value = 1024:

- check the communication link.
- if required, increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (switch-off/switch-on) for all components.
- replace the hardware.

For message value = 1030:

- check the encoder connection.
- if required, replace the encoder.

For message value = 1031:

When replacing a Sensor Module, carry out the following steps:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

Adapt the encoder parameterization for the second channel as follows:

- set the encoder type (p0400).
- activate the safety commissioning mode (p0010 = 95).
- start the copy function for encoder parameters (p9700 = 46).
- exit the safety commissioning mode (p0010 = 0).
- save the parameters in a non-volatile fashion (copy RAM to ROM).
- carry out a POWER ON (switch-off/switch-on) for all components.

The following always applies:

- check the encoder connection.
- if required, replace the encoder.

For message value = 1040:

- deselect encoderless monitoring functions, select and deselect STO.
- if monitoring function "SLS" is active, issue a pulse enable within 5 s of deselecting STO.

For message value = 6000 ... 6999:

- the significance of the individual message values is described in safety fault F01611 of the Control Unit.

For other message values:

- the significance of the individual message values is described in safety message C01711.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

### 230712 <location>SI Motion P2: Defect in F-IO processing

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** When cross checking and comparing the two monitoring channels, the drive detected a difference between parameters or results of the F-IO processing and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

The safety message C30711 with message value 0 is also displayed due to initiation of STOP F.

If at least one monitoring function is active, the safety message C30701 "SI Motion: STOP B initiated" is output after the parameterized timer has expired.

Message value (r9749, interpret decimal):

Number of the cross-compared data that resulted in this message.

Refer to the description of the message values in safety message C01712.

**Remedy:**

- check parameterization in the parameters involved and correct if required.
- ensure equality by copying the SI data to the second channel and then carry out an acceptance test.
- check monitoring clock cycle for equality (p9500, p9300).

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

See also: p9300 (SI Motion monitoring clock cycle (Motor Module)), p9500 (SI Motion monitoring clock cycle (Control Unit))

### 230714 <location>SI Motion P2: Safely-Limited Speed exceeded

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive had moved faster than that specified by the velocity limit value (p9331). The drive is stopped as a result of the configured stop response (p9363).

Message value (r9749, interpret decimal):

- 100: SLS1 exceeded.
- 200: SLS2 exceeded.
- 300: SLS3 exceeded.
- 400: SLS4 exceeded.
- 1000: Encoder limit frequency exceeded.

**Remedy:**

- check the traversing/motion program in the control.
- check the limits for "SLS" function and if required, adapt (p9331).

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

**Note:**

SI: Safety Integrated

SLS: Safely-Limited Speed / SG: Safely reduced speed

### 230715 <location>SI Motion P2: Safely-Limited Position exceeded

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The axis has moved past a parameterized position that is monitored by the "SLP" function.  
 Message value (r9749, interpret decimal):  
 10: SLP1 violated.  
 20: SLP2 violated.

**Remedy:**

- check the traversing/motion program in the control.
- check the limits for "SLP" function and if required, adapt (p9534, p9535).

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

**Prerequisite:**

- deselect "SLP" function and retract the axis into the permitted position range.

Carry out a safe acknowledgment using one of the following options:

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

**Note:**

SI: Safety Integrated

SLP: Safely-Limited Position / SE: Safe software limit switches

### 230716 <location>SI Motion P2: Tolerance for safe motion direction exceeded

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The tolerance for the "safe motion direction" function was exceeded. The drive is stopped as a result of the configured stop response (p9366).  
 Message value (r9749, interpret decimal):  
 0: Tolerance for the "safe motion direction positive" function exceeded.  
 1: Tolerance for the "safe motion direction negative" function exceeded.

**Remedy:**

- check the traversing/motion program in the control.
- check the tolerance for "SDI" function and if required, adapt (p9364).

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

Prerequisite:

- deselect the "SDI" function and if required select again.

Carry out a safe acknowledgment using one of the following options:

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

Note:

SDI: Safe Direction (safe motion direction)

SI: Safety Integrated

See also: p9364, p9365, p9366

---

**230717 <location>SI Motion P2: SLA limit exceeded**

**Drive object:** SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:**

The acceleration limit for the "Safely-Limited Acceleration" function was exceeded. The drive is stopped as a result of the configured stop response (p9379).

Message value (r9749, interpret decimal):

0: The monitoring of the coarsely resolved acceleration has violated the acceleration limit.

1: The monitoring of the finely resolved acceleration and possibly filtered acceleration has violated the acceleration limit.

**Remedy:**

- check the traversing/motion program in the control.
- check the acceleration limit for the "SLA" function and if required, adapt (p9378).
- carry out a safe acknowledgment.

For message value = 0:

Analyze the causes using r9714[0] and r9714[3].

For message value = 1:

Analyze the causes using r9789[0], r9789[1] and r9789[2].

Note:

SI: Safety Integrated

SLA: Safely-Limited Acceleration

See also: p9378 (SI Motion SLA acceleration limit (MM)), p9379 (SI Motion SLA stop response (Motor Module))

---

**230730 <location>SI Motion P2: Reference block for dynamic Safely-Limited Speed invalid**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:**

The reference block transferred via PROFIsafe is negative.

A reference block is used to generate a referred velocity limit value based on the reference quantity "Velocity limit value SLS1" (p9331[0]).

The drive is stopped as a result of the configured stop response (p9363[0]).

Message value (r9749, interpret decimal):

requested, invalid reference block.

**Remedy:** In the PROFIsafe telegram, input data S\_SLS\_LIMIT\_IJT must be corrected.  
 This message can be acknowledged without a POWER ON as follows (safe acknowledgment):  
 - PROFIsafe.  
**Note:**  
 SI: Safety Integrated  
 SLS: Safely-Limited Speed

---

### 230788 <location>Automatic test stop: wait for STO deselection via SMM

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The automatic test stop was not able to be carried out after powering up.  
 Possible causes:  
 - the STO function is selected via Safety Extended Functions.  
 - a safety message is present, that resulted in a STO.  
**Note:**  
 STO: Safe Torque Off  
**Remedy:** - Deselect STO via Safety Extended Functions.  
 - remove the cause of the safety messages and acknowledge the messages.  
**Note:**  
 The automatic test stop is performed after removing the cause.

---

### 230797 <location>SI Motion P2: Axis not safely referenced

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The standstill position saved before switching off does not match the actual position determined at switch-on.  
 Message value (r9749, interpret decimal):  
 1: Axis not safely referenced.  
 2: User agreement missing.  
**Remedy:** If safe automatic referencing is not possible the user must issue a user agreement for the new position using the softkey.  
 This mean that this position is then designated as safety-relevant.  
**Note:**  
 SI: Safety Integrated

---

### 230798 <location>SI Motion P2: Test stop for motion monitoring functions running

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The forced checking procedure (test stop) for the safe motion monitoring functions is currently in progress.  
**Remedy:** Not necessary.  
 The message is automatically withdrawn when the test stop has been completed.  
**Note:**  
 SI: Safety Integrated

| <b>Cause:</b>         | <p>A DRIVE-CLiQ communication error has occurred from the Control Unit to the power unit concerned.</p> <p>Fault cause:</p> <p>11 (= 0B hex):</p> <p>Synchronization error during alternating cyclic data transfer.</p> <p>Note regarding the message value:</p> <p>The individual information is coded as follows in the message value (r0949/r2124):</p> <p>0000yyxx hex: yy = component number, xx = error cause</p>                                                                                                                                                                                                                                 |

**Remedy:** Carry out a POWER ON (switch-off/switch-on).

---

**230850 <location>Power unit: Internal software error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Infeed: OFF1 (NONE, OFF2)  
Servo: OFF1 (NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** POWER ON

**Cause:** An internal software error has occurred in the power unit.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:** - replace power unit.  
- if required, upgrade the firmware in the power unit.  
- contact Technical Support.

---

**230851 <location>Power unit DRIVE-CLiQ (CU): Sign-of-life missing**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** Infeed: OFF2 (NONE, OFF1)  
Servo: OFF2 (NONE, OFF1, OFF3)  
Hla: OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the power unit to the Control Unit involved.  
The DRIVE-CLiQ component did not set the sign-of-life to the Control Unit.  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:** - deselect functions that are not required.  
- if required, increase the sampling times (p0112, p0115).  
- replace the component involved (power unit, Control Unit).

---

**230853 <location>Power unit: Sign-of-life error cyclic data**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The power unit has detected that the cyclic setpoint telegrams of the Control Unit have not been updated on time. At least two sign-of-life errors have occurred within the window set in p7788.

**Remedy:** - reduce the size of the window (p7788) for monitoring.  
- check the Motor Module, and if required replace.

| <b>Cause:</b>         | During initialization within the power unit, an internal software error has occurred. |

**Remedy:**

- if required, upgrade the firmware in the power unit.
- replace power unit.
- contact Technical Support.

---

### 230919 <location>Power unit: Temperature monitoring failed

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The temperature monitoring in the power unit has failed.  
 Fault-free operation of the drive system is no longer guaranteed.  
 Alarm value (r2124, interpret binary):  
 Bit 0: Sensor 1 for the internal temperature can no longer be evaluated.  
 Bit 1: Sensor 2 for the internal temperature can no longer be evaluated.

**Remedy:** Replace the power unit immediately.

---

### 230920 <location>Power unit: Temperature sensor fault

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When evaluating the temperature sensor, an error occurred.  
 Alarm value (r2124, interpret decimal):  
 1: Wire breakage or sensor not connected.  
 KTY: R > 1630 Ohm, PT100: R > 375 Ohm, PT1000: R > 1720 Ohm  
 2: Measured resistance too low.  
 PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT100: R < 30 Ohm, PT1000: R < 603 Ohm  
 Note:  
 A temperature sensor is connected to the following terminals:  
 - "Booksize" format: X21.1/.2 or X22.1/.2  
 - "Chassis" format: X41.4/.3  
 Information on temperature sensors is provided in the following literature for example:  
 SINAMICS S120 Function Manual Drive Functions

**Remedy:**

- make sure that the sensor is connected correctly.
- replace the sensor.

---

### 230930 <location>Power unit: Component trace has saved data

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Trace data was saved in the component.

**Remedy:** Not necessary.

Note:

For p7792= 1, the trace data of the component can be written to the memory card.

---

### 230950 <location>Power unit: Internal software error

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret decimal):  
Information about the fault source.  
Only for internal Siemens troubleshooting.

**Remedy:** - if necessary, upgrade the firmware in the power unit to a later version.  
- contact Technical Support.

---

**230999 <location>Power unit: Unknown alarm**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** New message: %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An alarm occurred on the power unit that cannot be interpreted by the Control Unit firmware.  
This can occur if the firmware on this component is more recent than the firmware on the Control Unit.  
Alarm value (r2124, interpret decimal):  
Alarm number.  
Note:  
If required, the significance of this new alarm can be read about in a more recent description of the Control Unit.

**Remedy:** - replace the firmware on the power unit by an older firmware version (r0128).  
- upgrade the firmware on the Control Unit (r0018).

---

**231100 <location>Encoder 1: Zero mark distance error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Infeed: NONE (OFF1, OFF2)  
Servo: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)  
Hla: ENCODER (NONE, OFF1, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** The measured zero mark distance does not correspond to the parameterized zero mark distance.  
For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.  
The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).  
Fault value (r0949, interpret decimal):  
Last measured zero mark distance in increments (4 increments = 1 encoder pulse).  
The sign designates the direction of motion when detecting the zero mark distance.  
See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:** - check that the encoder cables are routed in compliance with EMC.  
- check the plug connections.  
- check the encoder type (encoder with equidistant zero marks).  
- adapt the parameter for the distance between zero marks (p0424, p0425).  
- if message output above speed threshold, reduce filter time if necessary (p0438).  
- replace the encoder or encoder cable.

---

**231101 <location>Encoder 1: Zero mark failed**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Infeed: NONE (OFF1, OFF2)  
Servo: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)  
Hla: ENCODER (NONE, OFF1, OFF2, OFF3, STOP2)

| <b>Cause:</b>         | The signal level of the rectified encoder signals A and B of the encoder fall below the permissible limit value.<br>Fault value (r0949, interpret hexadecimal):<br>yyyyxxxx hex:<br>yyyy = Signal level, track B (16 bits with sign).<br>xxxx = Signal level, track A (16 bits with sign).<br>The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).<br>The response threshold is < 130 mV.<br>A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.<br>Note:<br>The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.<br>See also:p0491 (Motor encoder fault response ENCODER)                                                                                                                                                                                                                                                                                                          |

- Remedy:**
- check that the encoder cables and shielding are routed in compliance with EMC.
  - check the plug connections.
  - replace the encoder or encoder cable.
  - check the Sensor Module (e.g. contacts).

---

**231117 <location>Encoder 1: Inversion error signals A/B/R**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1 bin

**Reaction:** Infeed: NONE  
Servo: ENCODER (IASC/DCBRK, NONE)  
Hla: ENCODER (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** For a square-wave encoder (bipolar, double ended) signals A\*, B\* and R\* are not inverted with respect to signals A, B and R.  
Fault value (r0949, interpret binary):  
Bits 0 ... 15: Only for internal Siemens troubleshooting.  
Bit 16: Error track A.  
Bit 17: Error track B.  
Bit 18: Error track R.  
Note:  
For SMC30 (only Article No. 6SL3055-0AA00-5CA0 and 6SL3055-0AA00-5CA1), CUA32 and CU310-2, the following applies:  
A square-wave encoder without track R is used and track monitoring (p0405.2 = 1) is activated.  
See also: p0491 (Motor encoder fault response ENCODER)

- Remedy:**
- check the encoder/cable.
  - Does the encoder supply signals and the associated inverted signals?
- Note:  
For SMC30 (only Article Number 6SL3055-0AA00-5CA0 and 6SL3055-0AA00-5CA1), the following applies:  
- check the setting of p0405 (p0405.2 = 1 is only possible if the encoder is connected at X520).  
For a square-wave encoder without track R, the following jumpers must be set for the connection at X520 (SMC30), X220 (CUA32) or X23 (CU310-2):  
- pin 10 (reference signal R) <--> pin 7 (encoder power supply, ground)  
- pin 11 (reference signal R inverted) <--> pin 4 (encoder power supply)

---

**231118 <location>Encoder 1: Speed change not plausible**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Infeed: NONE  
Servo: ENCODER (IASC/DCBRK, NONE)  
Hla: ENCODER (NONE)

**Acknowledge:** PULSE INHIBIT

**Cause:** For an HTL/TTL encoder, the speed change has exceeded the value in p0492 over several sampling cycles.  
The change to the averaged speed actual value - if applicable - is monitored in the current controller sampling time.  
Encoder 1 is used as motor encoder and can be effective has fault response to change over to encoderless operation.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.  
See also: p0491, p0492

- Remedy:**
- check the tachometer feeder cable for interruptions.
  - check the grounding of the tachometer shielding.
  - if required, increase the maximum speed difference per sampling cycle (p0492).

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**231122 <location>Encoder 1: Sensor Module hardware fault****Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:**  
Infeed: NONE  
Servo: ENCODER  
Hla: ENCODER**Acknowledge:** IMMEDIATELY**Cause:**  
An internal Sensor Module hardware fault was detected.  
Fault value (r0949, interpret decimal):  
1: Reference voltage error.  
2: Internal undervoltage.  
3: Internal overvoltage.**Remedy:** Replace the motor with DRIVE-CLiQ or the appropriate Sensor Module.

---

**231123 <location>Encoder 1: Signal level A/B outside tolerance****Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** Fault cause: %1 bin**Reaction:**  
Infeed: NONE  
Servo: ENCODER (IASC/DCBRK, NONE)  
Hla: ENCODER (NONE)**Acknowledge:** PULSE INHIBIT**Cause:**  
The unipolar level (AP/AN or BP/BN) for encoder 1 is outside the permissible tolerance.  
Fault value (r0949, interpret binary):  
Bit 0 = 1: Either AP or AN outside the tolerance.  
Bit 16 = 1: Either BP or BN outside the tolerance.  
The unipolar nominal signal level of the encoder must lie in the range 2500 mV +/- 500 mV.  
The response thresholds are < 1700 mV and > 3300 mV.  
Note:  
The signal level is not evaluated unless the following conditions are satisfied:  
- Sensor Module properties available (r0459.31 = 1).  
- monitoring active (p0437.31 = 1).  
See also: p0491 (Motor encoder fault response ENCODER)  
**Remedy:**  
- make sure that the encoder cables and shielding are installed in an EMC-compliant manner.  
- check the plug connections and contacts of the encoder cable.  
- check the short-circuit of a signal cable with mass or the operating voltage.  
- replace the encoder cable.

FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.</p> <p>Note:</p> <p>The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.</p> <p>See also: p0491 (Motor encoder fault response ENCODER)</p> |

**Cause:** A position determination fault has occurred in the DRIVE-CLiQ encoder.  
Fault value (r0949, interpret binary):  
yyxxxxxx hex: yy = encoder version, xxxxxx = bit coding of the fault cause

-----

For yy = 8 (0000 1000 bin), the following applies:

- Bit 1: Signal monitoring (sin/cos).
- Bit 8: F1 (safety status display) error position word 1.
- Bit 9: F2 (safety status display) error position word 2.
- Bit 16: LED monitoring.
- Bit 17: Fault when determining the position (multiturn).
- Bit 18: Single-step capability monitoring singleturn from the Safety channel.
- Bit 19: ECRC, configuration error in the safety channel.
- Bit 23: Temperature outside the limit values.

-----

For yy = 11 (0000 1011 bin), the following applies:

- Bit 0: Position word 1 difference between rotation counter and software counter (XC\_ERR).
- Bit 1: Position word 1 track error of the incremental signals (LIS\_ERR).
- Bit 2: Position word 1 error when aligning between incremental track signals and absolute value (ST\_ERR).
- Bit 3: Maximum permissible temperature exceeded (TEMP\_ERR).
- Bit 4: Power supply overvoltage (MON\_OVR\_VOLT).
- Bit 5: Power supply overcurrent (MON\_OVR\_CUR).
- Bit 6: Power supply undervoltage (MON\_UND\_VOLT).
- Bit 7: Rotation error counter (MT\_ERR).
- Bit 8: F1 (safety status display) error position word 1.
- Bit 9: F2 (safety status display) error position word 2.
- Bit 11: Position word 1 status bit: singleturn position OK (ADC\_ready).
- Bit 12: Position word 1 status bit: rotation counter OK (MT\_ready).
- Bit 13: Position word 1 memory error (MEM\_ERR).
- Bit 14: Position word 1 absolute position error (MLS\_ERR).
- Bit 15: position word 1 LED error, lighting unit error (LED\_ERR).
- Bit 18: Position word 2 error when aligning between incremental track signals and absolute value (ST\_ERR).
- Bit 21: Position word 2 memory error (MEM\_ERR).
- Bit 22: Position word 2 absolute position error (MLS\_ERR).
- Bit 23: position word 2 LED error, lighting unit error (LED\_ERR).

-----

For yy = 12 (0000 1100 bin), the following applies:

- Bit 8: encoder fault.
- Bit 10: error in the internal position data transport.

-----

For yy = 14 (0000 1110 bin), the following applies:

- Bit 0: Position word 1 temperature outside limit value.
- Bit 1: Position word 1 position determination error (multiturn).
- Bit 2: Position word 1 FPGA error.
- Bit 3: Position word 1 velocity error.
- Bit 4: Position word 1 communication error between FPGAs/error in the incremental signal.
- Bit 5: Position word 1 timeout absolute value/error when determining the position (singleturn).
- Bit 6: Position word 1 internal hardware fault (clock/power monitor IC/power).
- Bit 7: Position word 1 internal error (FPGA communication/FPGA parameterization/self-test/software).
- Bit 8: F1 (safety status display) error position word 1.
- Bit 9: F2 (safety status display) error position word 2.
- Bit 16: Position word 2 temperature outside limit value.
- Bit 17: Position word 2 position determination error (multiturn).

Bit 18: Position word 2 FPGA error.  
Bit 19: Position word 2 velocity error.  
Bit 20: Position word 2 communication error between FPGAs.  
Bit 21: Position word 2 position determination error (singleturn).  
Bit 22: Position word 2 internal hardware fault (clock/power monitor IC/power).  
Bit 23: Position word 2 internal error (self-test/software).

-----  
Note:

For an encoder version that is not described here, please contact the encoder manufacturer for more detailed information on the bit coding.

**Remedy:**

- determine the detailed cause of the fault using the fault value.
- if required, replace the DRIVE-CLiQ encoder.

---

**231138**      **<location>Encoder 1: Fault when determining the position (multiturn)**

**Note:**

For an encoder version that is not described here, please contact the encoder manufacturer for more detailed information on the bit coding.

**Remedy:**

- determine the detailed cause of the fault using the fault value.
- if required, replace the DRIVE-CLiQ encoder.

---

### 231142 <location>Encoder 1: Battery voltage fault

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:**

Infeed: ENCODER (NONE, OFF1, OFF2)

Servo: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)

Hla: ENCODER (NONE, OFF1, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** When switched-off, the encoder uses a battery to back up the multiturn information. The battery voltage is no longer sufficient to check the multiturn information.

**Remedy:** Replace battery.

---

### 231150 <location>Encoder 1: Initialization error

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:**

Infeed: NONE

Servo: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)

Hla: ENCODER (NONE, OFF1, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** Encoder functionality selected in p0404 cannot be executed.

Fault value (r0949, interpret hexadecimal):

Encoder malfunction.

The bit assignment corresponds to that of p0404 (e.g. bit 5 set: Error track C/D).

See also: p0404 (Encoder configuration effective), p0491 (Motor encoder fault response ENCODER)

**Remedy:**

- check that p0404 is correctly set.
- check the encoder type used (incremental/absolute) and for SMCxx, the encoder cable.
- if relevant, note additional fault messages that describe the fault in detail.

---

### 231151 <location>Encoder 1: Encoder speed for initialization AB too high

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:**

Infeed: NONE

Servo: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2)

Hla: ENCODER (NONE, OFF1, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** The encoder speed is too high while initializing the Sensor Module.

**Remedy:** Reduce the speed of the encoder accordingly during initialization.

If necessary, deactivate monitoring (p0437.29).

See also: p0437 (Sensor Module configuration extended)

---

### 231152 <location>Encoder 1: Max. signal frequency (track A/B) exceeded

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

| <b>Message value:</b> | %1                                                                                 |
| <b>Reaction:</b>      | Infeed: ENCODER (NONE)<br>Servo: ENCODER (IASC/DCBRK, NONE)<br>Hla: ENCODER (NONE) |
| <b>Acknowledge:</b>   | PULSE INHIBIT                                                                      |

**Cause:** The input voltage of the analog sensor is outside the permissible limits.  
 Fault value (r0949, interpret decimal):  
 1: Input voltage outside detectable measuring range.  
 2: Input voltage outside the selected measuring range (p4675).  
 3: The absolute value of the input voltage has exceeded the range limit (p4676).

**Remedy:** For fault value = 1:  
 - check the output voltage of the analog sensor.  
 For fault value = 2:  
 - check the voltage setting for each encoder period (p4675).  
 For fault value = 3:  
 - check the range limit setting and increase it if necessary (p4676).

---

### 231163 <location>Encoder 1: Analog sensor position value exceeds limit value

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Infeed: ENCODER (NONE)  
 Servo: ENCODER (IASC/DCBRK, NONE)  
 Hla: ENCODER (NONE)

**Acknowledge:** PULSE INHIBIT

**Cause:** The position value has exceeded the permissible range of -0.5 ... +0.5.  
 Fault value (r0949, interpret decimal):  
 1: Position value from the LVDT sensor.  
 2: Position value from the encoder characteristic.

**Remedy:** For fault value = 1:  
 - check the LVDT ratio (p4678).  
 - check the reference signal connection at track B.  
 For fault value = 2:  
 - check the coefficients of the characteristic (p4663 ... p4666).

---

### 231400 <location>Encoder 1: Zero mark distance error (alarm threshold exceeded)

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The measured zero mark distance does not correspond to the parameterized zero mark distance.  
 For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.  
 The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).  
 Alarm value (r2124, interpret decimal):  
 Last measured zero mark distance in increments (4 increments = 1 encoder pulse).  
 The sign designates the direction of motion when detecting the zero mark distance.

**Remedy:** - check that the encoder cables are routed in compliance with EMC.  
 - check the plug connections.  
 - check the encoder type (encoder with equidistant zero marks).  
 - adapt the parameter for the distance between zero marks (p0424, p0425).  
 - replace the encoder or encoder cable.

---

### 231412 <location>Encoder 1: Encoder signals an internal alarm

|                       |                                                                               |
|-----------------------|-------------------------------------------------------------------------------|
| <b>Drive object:</b>  | A_INF_828, B_INF_828, HLA_828, S_INF_828, S_INF_COMBI, SERVO_828, SERVO_COMBI |
| <b>Message value:</b> | %1                                                                            |
| <b>Reaction:</b>      | NONE                                                                          |
| <b>Acknowledge:</b>   | NONE                                                                          |

- Cause:** The encoder signals an internal alarm via serial protocol.  
Alarm value (r2124, interpret binary):  
Bit 0: Fault bit in the position protocol.  
Bit 1: Alarm bit in the position protocol.
- Remedy:**
- carry out a POWER ON (switch-off/switch-on) for all components.
  - check that the encoder cables are routed in compliance with EMC.
  - check the plug connections.
  - replace encoder.

---

**231414 <location>Encoder 1: Signal level track C or D out of tolerance**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** C track: %1, D track: %2

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The signal level ( $C^2 + D^2$ ) of track C or D of the encoder or from the Hall signals, is not within the tolerance bandwidth.  
Alarm value (r2124, interpret hexadecimal):  
yyyyxxxx hex:  
yyyy = Signal level, track D (16 bits with sign).  
xxxx = Signal level, track C (16 bits with sign).  
The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).  
The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV.  
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.  
Note:

- If the amplitude is not within the tolerance bandwidth, then it cannot be used to initialize the start position.
- Remedy:**
- check that the encoder cables are routed in compliance with EMC.
  - check the plug connections.
  - replace the encoder or encoder cable.
  - check the Sensor Module (e.g. contacts).
  - check the Hall sensor box.

---

**231415 <location>Encoder 1: Signal level track A or B outside tolerance (alarm)**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Amplitude: %1, Angle: %2

**Reaction:** NONE

**Acknowledge:** NONE

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>  | <p>The signal level (root from <math>A^2 + B^2</math>) of the encoder is outside the permissible tolerance.</p> <p>Alarm value (r2124, interpret hexadecimal):</p> <p>yyyyxxxx hex:</p> <p>yyyy = Angle</p> <p>xxxx = amplitude, i.e. root of <math>A^2 + B^2</math> (16 bits without sign)</p> <p>The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).</p> <p>The response threshold is &lt; 230 mV (observe the frequency response of the encoder).</p> <p>A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.</p> <p>The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.</p> <p>Note for Sensor Modules for resolvers (e.g. SMC10):</p> <p>The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is &lt; 1414 mV (1.0 Vrms).</p> <p>A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.</p> <p>Note:</p> <p>The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.</p> <p>See also:p0491 (Motor encoder fault response ENCODER)</p> |

| <b>Reaction:</b>      | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Cause:</b>         | The measured zero mark distance does not correspond to the parameterized zero mark distance.<br>This alarm is triggered with active square-wave encoder PPR correction and re-parameterized fault 31131 if the accumulator contains larger values than p4683 or p4684.<br>The zero mark distance for zero mark monitoring is set in p0425 (rotary encoder).<br>Alarm value (r2124, interpret decimal):<br>accumulated differential pulses in encoder pulses.<br>See also: p0491 (Motor encoder fault response ENCODER) |

- Remedy:**
- check that the encoder cables are routed in compliance with EMC.
  - check the plug connections.
  - check the encoder type (encoder with equidistant zero marks).
  - adapt the parameter for the distance between zero marks (p0424, p0425).
  - replace the encoder or encoder cable.

---

### 231429 <location>Encoder 1: Position difference hall sensor/track C/D and A/B too large

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The error for track C/D is greater than  $\pm 15^\circ$  mechanical or  $\pm 60^\circ$  electrical or the error for the Hall signals is greater than  $\pm 60^\circ$  electrical.

One period of track C/D corresponds to  $360^\circ$  mechanical.

One period of the Hall signal corresponds to  $360^\circ$  electrical.

The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.

Alarm value (r2124, interpret decimal):

For track C/D, the following applies:

Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to  $1^\circ$ ).

For Hall signals, the following applies:

Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to  $1^\circ$ ).

See also: p0491 (Motor encoder fault response ENCODER)

- Remedy:**
- track C or D not connected.
  - correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D.
  - check that the encoder cables are routed in compliance with EMC.
  - check the adjustment of the Hall sensor.

---

### 231431 <location>Encoder 1: Position deviation incremental/absolute too high (alarm)

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When the zero pulse is passed, a deviation in the incremental position was detected.

For equidistant zero marks, the following applies:

- the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.

For distance-coded zero marks, the following applies:

- the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.

Alarm value (r2124, interpret decimal):

Deviation in quadrants (1 pulse = 4 quadrants).

See also: p0491 (Motor encoder fault response ENCODER)

- Remedy:**
- check that the encoder cables are routed in compliance with EMC.
  - check the plug connections.
  - replace the encoder or encoder cable.
  - Clean coding disk or remove strong magnetic fields.

---

### 231432 <location>Encoder 1: Rotor position adaptation corrects deviation

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

| <b>Reaction:</b>      | NONE                                                                                                                                                                                                                |
| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                |
| <b>Cause:</b>         | The position value has exceeded the permissible range of -0.5 ... +0.5.<br>Alarm value (r2124, interpret decimal):<br>1: Position value from the LVDT sensor.<br>2: Position value from the encoder characteristic. |

**Remedy:** For alarm value = 1:  
- check the LVDT ratio (p4678).  
- check the reference signal connection at track B.  
For alarm value = 2:  
- check the coefficients of the characteristic (p4663 ... p4666).

---

**231470 <location>Encoder 1: Encoder signals an internal error (X521.7)**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** For the Sensor Module Cabinet 30 (SMC30), a dirty encoder is signaled via a 0 signal at terminal X521.7.  
**Remedy:** - check the plug connections.  
- replace the encoder or encoder cable.

---

**231500 <location>Encoder 1: Position tracking traversing range exceeded**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** Infeed: OFF1 (NONE, OFF2)  
Servo: OFF1 (NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.  
For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.  
For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).  
**Remedy:** The fault should be resolved as follows:  
- select encoder commissioning (p0010 = 4).  
- reset the position tracking as follows (p0411.2 = 1).  
- deselect encoder commissioning (p0010 = 0).  
The fault should then be acknowledged and the absolute encoder adjusted.

---

**231501 <location>Encoder 1: Position tracking encoder position outside tolerance window**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** Infeed: OFF1 (NONE, OFF2)  
Servo: OFF1 (NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** When switched off, the drive/encoder was moved through a distance greater than was parameterized in the tolerance window. It is possible that there is no longer any reference between the mechanical system and encoder.  
Fault value (r0949, interpret decimal):  
Deviation (difference) to the last encoder position in increments of the absolute value.  
The sign designates the traversing direction.  
Note:  
The deviation (difference) found is also displayed in r0477.  
See also:p0413 (Measuring gear position tracking tolerance window), r0477 (Measuring gear position difference)

**Remedy:** Reset the position tracking as follows:

- select encoder commissioning (p0010 = 4).
- reset the position tracking as follows (p0411.2 = 1).
- deselect encoder commissioning (p0010 = 0).

The fault should then be acknowledged and, if necessary, the absolute encoder adjusted (p2507).  
See also: p0010

### 231502 <location>Encoder 1: Encoder with measuring gear without valid signals

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** Infeed: OFF1 (OFF2)  
Servo: OFF1 (OFF2, OFF3)  
Hla: OFF1 (OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The encoder with measuring gear no longer provides any valid signals.

**Remedy:** It must be ensured that all of the encoders, with mounted measuring gear, provide valid actual values in operation.

---

### 231503 <location>Encoder 1: Position tracking cannot be reset

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** Infeed: OFF1 (NONE, OFF2)  
Servo: OFF1 (NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The position tracking for the measuring gear cannot be reset.

**Remedy:** The fault should be resolved as follows:

- select encoder commissioning (p0010 = 4).
- reset the position tracking as follows (p0411.2 = 1).
- deselect encoder commissioning (p0010 = 0).

The fault should then be acknowledged and the absolute encoder adjusted.

---

### 231700 <location>Encoder 1: Functional safety monitoring initiated

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1 bin

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Functional safety was activated. Self-test of the DRIVE-CLiQ encoder has detected a fault.  
Alarm value (r2124, interpret binary):  
Bit x = 1: Effectivity test x unsuccessful.

**Remedy:** Replace encoder.

---

### 231800 <location>Encoder 1: Group signal

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** Infeed: OFF2 (NONE)  
Servo: ENCODER (IASC/DCBRK, NONE)  
Hla: ENCODER (NONE)

**Acknowledge:** NONE

**Cause:** The motor encoder has detected at least one fault.  
See also:p0491 (Motor encoder fault response ENCODER)

**Remedy:** Evaluate the other messages that are presently available.

---

**231801**      **<location>Encoder 1 DRIVE-CLiQ: Sign-of-life missing**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** Infeed: OFF2 (NONE)  
Servo: ENCODER (IASC/DCBRK, NONE)  
Hla: ENCODER (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder involved.  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause  
See also:p0491 (Motor encoder fault response ENCODER)

**Remedy:** - check the electrical cabinet design and cable routing for EMC compliance  
- replace the component involved.

---

**231802**      **<location>Encoder 1: Time slice overflow**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Infeed: OFF2 (NONE)  
Servo: ENCODER (IASC/DCBRK, NONE)  
Hla: ENCODER (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** A time slice overflow has occurred in encoder 1.  
Fault value (r0949, interpret hexadecimal):  
yx hex: y = function involved (Siemens-internal fault diagnostics), x = time slice involved  
x = 9:  
Time slice overflow of the fast (current controller clock cycle) time slice.  
x = A:  
Time slice overflow of the average time slice.  
x = C:  
Time slice overflow of the slow time slice.  
yx = 3E7:  
Timeout when waiting for SYNO (e.g. unexpected return to non-cyclic operation).  
See also:p0491 (Motor encoder fault response ENCODER)

**Remedy:** Increase the current controller sampling time  
Note:  
For a current controller sampling time = 31.25 µs, use an SMx20 with Article No. 6SL3055-0AA00-5xA3.

---

**231804**      **<location>Encoder 1: Sensor Module checksum error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

| <b>Cause:</b>  | <p>The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and built-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2).</p> <p>Cause 1:</p> <ul style="list-style-type: none"> <li>- the encoder was replaced.</li> </ul> <p>Cause 2:</p> <ul style="list-style-type: none"> <li>- a third-party, built-in or linear motor was re-commissioned.</li> </ul> <p>Cause 3:</p> <ul style="list-style-type: none"> <li>- the motor with integrated and adjusted encoder was replaced.</li> </ul> <p>Cause 4:</p> <ul style="list-style-type: none"> <li>- the firmware was updated to a version that checks the encoder serial number.</li> </ul> <p>Note:</p> <p>With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).<br/>When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).</p> <p>Proceed as follows to hide serial number monitoring:</p> <ul style="list-style-type: none"> <li>- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.</li> <li>- parameterize F07414 as message type N (p2118, p2119).</li> </ul> <p>See also: p0491 (Motor encoder fault response ENCODER)</p> |
| <b>Remedy:</b> | <p>For causes 1, 2:</p> <p>Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed.</p> <p>SERVO:</p> <p>If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated.</p> <p>or</p> <p>Set the adjustment via p0431. In this case, the new serial number is automatically accepted.</p> <p>or</p> <p>Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.</p> <p>For causes 3, 4:</p> <p>Accept the new serial number with p0440 = 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### 231813 <location>Encoder 1: Hardware logic unit failed

|                       |                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------|
| <b>Drive object:</b>  | A_INF_828, B_INF_828, HLA_828, S_INF_828, S_INF_COMBI, SERVO_828, SERVO_COMBI           |
| <b>Message value:</b> | Fault cause: %1 bin                                                                     |
| <b>Reaction:</b>      | <p>Infeed: NONE</p> <p>Servo: ENCODER (IASC/DCBRK, NONE)</p> <p>HLA: ENCODER (NONE)</p> |
| <b>Acknowledge:</b>   | PULSE INHIBIT                                                                           |

**Cause:** The logic unit of the DRIVE-CLiQ encoder has failed.  
Fault value (r0949, interpret binary):  
Bit 0: ALU watchdog has responded.  
Bit 1: ALU has detected a sign-of-life error.

**Remedy:** When the error reoccurs, replace the encoder.

---

**231820 <location>Encoder 1 DRIVE-CLiQ: Telegram error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** Infeed: OFF2  
Servo: ENCODER (IASC/DCBRK, NONE)  
Hla: ENCODER (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder concerned.  
Fault cause:  
1 (= 01 hex):  
Checksum error (CRC error).  
2 (= 02 hex):  
Telegram is shorter than specified in the length byte or in the receive list.  
3 (= 03 hex):  
Telegram is longer than specified in the length byte or in the receive list.  
4 (= 04 hex):  
The length of the receive telegram does not match the receive list.  
5 (= 05 hex):  
The type of the receive telegram does not match the receive list.  
6 (= 06 hex):  
The address of the component in the telegram and in the receive list do not match.  
7 (= 07 hex):  
A SYNC telegram is expected - but the received telegram is not a SYNC telegram.  
8 (= 08 hex):  
No SYNC telegram is expected - but the received telegram is one.  
9 (= 09 hex):  
The error bit in the receive telegram is set.  
16 (= 10 hex):  
The receive telegram is too early.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause  
See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:** - carry out a POWER ON (switch-off/switch-on).  
- check the electrical cabinet design and cable routing for EMC compliance  
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

| <b>Cause:</b>         | <p>For the activated function "Data logger" (p0437.0 = 1) a fault has occurred with the Sensor Module. This alarm indicates that the diagnostics data corresponding to the fault was saved on the memory card.</p> <p>The diagnostics data is saved in the following folder:</p> <p>/USER/SINAMICS/DATA/SMTRC00.BIN</p> <p>...</p> <p>/USER/SINAMICS/DATA/SMTRC07.BIN</p> <p>/USER/SINAMICS/DATA/SMTRCIDX.TXT</p> <p>The following information is contained in the TXT file:</p> <ul style="list-style-type: none"> <li>- Display of the last written BIN file.</li> <li>- Number of write operations that are still possible (from 10000 downwards).</li> </ul> <p>Note:</p> <p>Only Siemens can evaluate the BIN files.</p> |

**Remedy:** Not necessary.  
This alarm is automatically withdrawn.  
The data logger is ready to record the next fault case.

---

**231940 <location>Encoder 1: Spindle sensor S1 voltage incorrect**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The voltage of analog sensor S1 is outside the permissible range.  
Alarm value (r2124, interpret decimal):  
Signal level from sensor S1.  
Note:  
A signal level of 500 mV corresponds to the numerical value 500 dec.

**Remedy:** - check the clamped tool.  
- check the tolerance and if required, adapt (p5040).  
- check the thresholds and if required, adapt (p5041).  
- check analog sensor S1 and connections.  
See also: p5040 (Spindle voltage threshold values tolerance), p5041 (Spindle voltage threshold values)

**231950 <location>Encoder 1: Internal software error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** ENCODER (OFF2)

**Acknowledge:** POWER ON

**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret decimal):  
The fault value contains information regarding the fault source.  
Only for internal Siemens troubleshooting.

**Remedy:** - if necessary, upgrade the firmware in the Sensor Module to a later version.  
- contact Technical Support.

---

**231999 <location>Encoder 1: Unknown alarm**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** New message: %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A alarm has occurred on the Sensor Module for encoder 1 that cannot be interpreted by the Control Unit firmware.  
This can occur if the firmware on this component is more recent than the firmware on the Control Unit.  
Alarm value (r2124, interpret decimal):  
Alarm number.  
Note:  
If required, the significance of this new alarm can be read about in a more recent description of the Control Unit.  
See also: p0491 (Motor encoder fault response ENCODER)

**Remedy:** - replace the firmware on the Sensor Module by an older firmware version (r0148).  
- upgrade the firmware on the Control Unit (r0018).

---

**232100 <location>Encoder 2: Zero mark distance error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

### 232103 <location>Encoder 2: Signal level zero track (track R) outside tolerance

|                       |                                                                            |
|-----------------------|----------------------------------------------------------------------------|
| <b>Drive object:</b>  | HLA_828, SERVO_828, SERVO_COMBI                                            |
| <b>Message value:</b> | R track: %1                                                                |
| <b>Reaction:</b>      | Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)<br>Hla: OFF1 (NONE, OFF2, OFF3) |
| <b>Acknowledge:</b>   | IMMEDIATELY                                                                |

- Cause:** The zero mark signal level (track R) does not lie within the tolerance bandwidth for encoder 2.  
The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is undershot.  
Fault value (r0949, interpret hexadecimal):  
yyyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign)  
The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV.  
The response threshold for the differential signal level of the encoder is < -1600 mV.  
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.  
Note:  
The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module.  
The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV).  
The signal level is not evaluated unless the following conditions are satisfied:  
- Sensor Module properties available (r0459.31 = 1).  
- monitoring active (p0437.31 = 1).
- Remedy:** - check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range  
- check that the encoder cables and shielding are routed in compliance with EMC.  
- check the plug connections and contacts of the encoder cable.  
- check the encoder type (encoder with zero marks).  
- check whether the zero mark is connected and the signal cables RP and RN have been connected correctly (not connected with the incorrect polarity).  
- replace the encoder cable.  
- if the coding disk is soiled or the lighting aged, replace the encoder.

---

**232110 <location>Encoder 2: Serial communications error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1 bin

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** PULSE INHIBIT

**Cause:** There is an error in the transfer of the serial communication protocol between the encoder and internal or external evaluation module.

Fault value (r0949, interpret binary):

For an EnDat 2.1 encoder, the significance of the fault value is as follows:

Bit 0: Alarm bit in the position protocol.

Bit 1: Incorrect quiescent level on the data line.

Bit 2: Encoder does not respond (does not supply a start bit within 50 ms).

Bit 3: CRC error: The checksum in the protocol from the encoder does not match the data.

Bit 4: Encoder acknowledgment error: The encoder incorrectly understood the task (request) or cannot execute it.

Bit 5: Internal error in the serial driver: An illegal mode command was requested.

Bit 6: Timeout when cyclically reading.

Bit 7: Timeout for the register communication.

Bit 8: Protocol is too long (e.g. > 64 bits).

Bit 9: Receive buffer overflow.

Bit 10: Frame error when reading twice.

Bit 11: Parity error.

Bit 12: Data line signal level error during the monoflop time.

Bit 13: Data line incorrect.

Bit 14: Fault for the register communication.

Bit 15: Internal communication error.

Note:

For an EnDat 2.2 encoder, the significance of the fault value for F3x135 (x = 1, 2, 3) is described.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Cause:</b>         | <p>The encoder error word provides detailed information (error bit).</p> <p>For p0404.8 = 0, the following applies:</p> <p>Fault value for internal Siemens troubleshooting.</p> <p>For p0404.8 = 1, the following applies:</p> <p>Fault value (r0949, interpret binary):</p> <p>yyyyxxxx hex: yyyy = supplementary information, xxxx = fault cause</p> <p>yyyy = 0:</p> <p>Bit 0: Lighting system failed.</p> <p>Bit 1: Signal amplitude too low.</p> <p>Bit 2: Position value incorrect.</p> <p>Bit 3: Encoder power supply overvoltage condition.</p> <p>Bit 4: Encoder power supply undervoltage condition.</p> <p>Bit 5: Encoder power supply overcurrent condition.</p> <p>Bit 6: The battery must be changed.</p> |

**Remedy:**

For yyyy = 0:  
For fault value, bit 0 = 1:  
Encoder is defective. Replace the encoder, where the motor encoder has a direct DRIVE-CLiQ socket: Replace the motor.  
For fault value, bit 1 = 1:  
Encoder is defective. Replace the encoder, where the motor encoder has a direct DRIVE-CLiQ socket: Replace the motor.  
For fault value, bit 2 = 1:  
Encoder is defective. Replace the encoder, where the motor encoder has a direct DRIVE-CLiQ socket: Replace the motor.  
For fault value, bit 3 = 1:  
5 V power supply voltage fault.  
When using an SMC: Check the plug-in cable between the encoder and SMC or replace the SMC.  
When a motor encoder with a direct DRIVE-CLiQ connection is used: Replace the motor.  
For fault value, bit 4 = 1:  
5 V power supply voltage fault.  
When using an SMC: Check the plug-in cable between the encoder and SMC or replace the SMC.  
When using a motor with DRIVE-CLiQ: Replace the motor.  
For fault value, bit 5 = 1:  
Encoder is defective. Replace the encoder, where the motor encoder has a direct DRIVE-CLiQ socket: Replace the motor.  
For fault value, bit 6 = 1:  
The battery must be changed (only for encoders with battery back-up).  
For yyyy = 1:  
Encoder is defective. Replace encoder.

---

**232112 <location>Encoder 2: Encoder signals an internal error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** PULSE INHIBIT  
**Cause:** The encoder signals a set error bit via the serial protocol.  
Fault value (r0949, interpret binary):  
Bit 0: Fault bit in the position protocol.  
**Remedy:** For fault value, bit 0 = 1:  
In the case of an EnDat encoder, F31111 may provide further details.

---

**232123 <location>Encoder 2: Signal level A/B outside tolerance****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** Fault cause: %1 bin**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)**Acknowledge:** IMMEDIATELY

**Cause:** The unipolar level (AP/AN or BP/BN) for encoder 2 is outside the permissible tolerance.  
Fault value (r0949, interpret binary):  
Bit 0 = 1: Either AP or AN outside the tolerance.  
Bit 16 = 1: Either BP or BN outside the tolerance.  
The unipolar nominal signal level of the encoder must lie in the range 2500 mV +/- 500 mV.  
The response thresholds are < 1700 mV and > 3300 mV.  
Note:  
The signal level is not evaluated unless the following conditions are satisfied:  
- Sensor Module properties available (r0459.31 = 1).  
- monitoring active (p0437.31 = 1).

**Remedy:** - make sure that the encoder cables and shielding are installed in an EMC-compliant manner.  
- check the plug connections and contacts of the encoder cable.  
- check the short-circuit of a signal cable with mass or the operating voltage.  
- replace the encoder cable.

---

**232125 <location>Encoder 2: Signal level track A or B too high****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** A track: %1, B-track: %2**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)**Acknowledge:** PULSE INHIBIT

**Cause:** The signal level (root from  $A^2 + B^2$ ) of the encoder exceeds the permissible limit value.  
Fault value (r0949, interpret hexadecimal):  
yyyyxxxx hex:  
yyyy = Signal level, track B (16 bits with sign).  
xxxx = Signal level, track A (16 bits with sign).  
The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).  
The response threshold is > 750 mV.  
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.  
Note for Sensor Modules for resolvers (e.g. SMC10):  
The nominal signal level is at 2900 mV (2.0 Vrms).  
The response threshold is > 3582 mV.  
A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.  
Note:  
The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:** - check that the encoder cables and shielding are routed in compliance with EMC.  
- replace the encoder or encoder cable.

---

**232137 <location>Encoder 2: Fault when determining the position (single turn)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1 bin

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** PULSE INHIBIT

**Cause:** A position determination fault has occurred in the DRIVE-CLiQ encoder.  
Fault value (r0949, interpret binary):  
yyxxxxx hex: yy = encoder version, xxxxxx = bit coding of the fault cause

-----

For yy = 8 (0000 1000 bin), the following applies:

- Bit 1: Signal monitoring (sin/cos).
- Bit 8: F1 (safety status display) error position word 1.
- Bit 9: F2 (safety status display) error position word 2.
- Bit 16: LED monitoring.
- Bit 17: Fault when determining the position (multiturn).
- Bit 18: Single-step capability monitoring singleturn from the Safety channel.
- Bit 19: ECRC, configuration error in the safety channel.
- Bit 23: Temperature outside the limit values.

-----

For yy = 11 (0000 1011 bin), the following applies:

- Bit 0: Position word 1 difference between rotation counter and software counter (XC\_ERR).
- Bit 1: Position word 1 track error of the incremental signals (LIS\_ERR).
- Bit 2: Position word 1 error when aligning between incremental track signals and absolute value (ST\_ERR).
- Bit 3: Maximum permissible temperature exceeded (TEMP\_ERR).
- Bit 4: Power supply overvoltage (MON\_OVR\_VOLT).
- Bit 5: Power supply overcurrent (MON\_OVR\_CUR).
- Bit 6: Power supply undervoltage (MON\_UND\_VOLT).
- Bit 7: Rotation error counter (MT\_ERR).
- Bit 8: F1 (safety status display) error position word 1.
- Bit 9: F2 (safety status display) error position word 2.
- Bit 11: Position word 1 status bit: singleturn position OK (ADC\_ready).
- Bit 12: Position word 1 status bit: rotation counter OK (MT\_ready).
- Bit 13: Position word 1 memory error (MEM\_ERR).
- Bit 14: Position word 1 absolute position error (MLS\_ERR).
- Bit 15: position word 1 LED error, lighting unit error (LED\_ERR).
- Bit 18: Position word 2 error when aligning between incremental track signals and absolute value (ST\_ERR).
- Bit 21: Position word 2 memory error (MEM\_ERR).
- Bit 22: Position word 2 absolute position error (MLS\_ERR).
- Bit 23: position word 2 LED error, lighting unit error (LED\_ERR).

-----

For yy = 12 (0000 1100 bin), the following applies:

- Bit 8: encoder fault.
- Bit 10: error in the internal position data transport.

-----

For yy = 14 (0000 1110 bin), the following applies:

- Bit 0: Position word 1 temperature outside limit value.
- Bit 1: Position word 1 position determination error (multiturn).
- Bit 2: Position word 1 FPGA error.
- Bit 3: Position word 1 velocity error.
- Bit 4: Position word 1 communication error between FPGAs/error in the incremental signal.
- Bit 5: Position word 1 timeout absolute value/error when determining the position (singleturn).
- Bit 6: Position word 1 internal hardware fault (clock/power monitor IC/power).
- Bit 7: Position word 1 internal error (FPGA communication/FPGA parameterization/self-test/software).
- Bit 8: F1 (safety status display) error position word 1.
- Bit 9: F2 (safety status display) error position word 2.
- Bit 16: Position word 2 temperature outside limit value.
- Bit 17: Position word 2 position determination error (multiturn).

Bit 18: Position word 2 FPGA error.  
Bit 19: Position word 2 velocity error.  
Bit 20: Position word 2 communication error between FPGAs.  
Bit 21: Position word 2 position determination error (singleturn).  
Bit 22: Position word 2 internal hardware fault (clock/power monitor IC/power).  
Bit 23: Position word 2 internal error (self-test/software).

-----  
**Note:**

For an encoder version that is not described here, please contact the encoder manufacturer for more detailed information on the bit coding.

**Remedy:**

- determine the detailed cause of the fault using the fault value.
- if required, replace the DRIVE-CLiQ encoder.

---

**232138**      **<location>Encoder 2: Fault when determining the position (multiturn)**

**Drive object:**    HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:**    Fault cause: %1 bin

**Reaction:**        Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

- Bit 7: Position word 1 internal error (FPGA communication/FPGA parameterization/self-test/software).
- Bit 8: F1 (safety status display) error position word 1.
- Bit 9: F2 (safety status display) error position word 2.
- Bit 16: Position word 2 temperature outside limit value.
- Bit 17: Position word 2 position determination error (multiturn).
- Bit 18: Position word 2 FPGA error.
- Bit 19: Position word 2 velocity error.
- Bit 20: Position word 2 communication error between FPGAs.
- Bit 21: Position word 2 position determination error (singleturn).
- Bit 22: Position word 2 internal hardware fault (clock/power monitor IC/power).

Bit 23: Position word 2 internal error (self-test/software).

-----

**Note:**

For an encoder version that is not described here, please contact the encoder manufacturer for more detailed information on the bit coding.

**Remedy:**

- determine the detailed cause of the fault using the fault value.
- if required, replace the DRIVE-CLiQ encoder.

---

### **232142      <location>Encoder 2: Battery voltage fault**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** When switched-off, the encoder uses a battery to back up the multturn information. The battery voltage is no longer sufficient to check the multturn information.

**Remedy:** Replace battery.

---

### **232150      <location>Encoder 2: Initialization error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** Encoder functionality selected in p0404 cannot be executed.  
Fault value (r0949, interpret hexadecimal):  
Encoder malfunction.

The bit assignment corresponds to that of p0404 (e.g. bit 5 set: Error track C/D).

**Remedy:**

- check that p0404 is correctly set.
- check the encoder type used (incremental/absolute) and for SMCxx, the encoder cable.
- if relevant, note additional fault messages that describe the fault in detail.

---

### **232151      <location>Encoder 2: Encoder speed for initialization AB too high**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** The encoder speed is too high while initializing the Sensor Module.

**Remedy:** Reduce the speed of the encoder accordingly during initialization.  
If necessary, deactivate monitoring (p0437.29).  
See also: p0437 (Sensor Module configuration extended)

---

### **232152      <location>Encoder 2: Max. signal frequency (track A/B) exceeded**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** The maximum signal frequency of the encoder evaluation has been exceeded.  
Fault value (r0949, interpret decimal):  
Actual input frequency in Hz.  
See also:p0408

**Remedy:** - reduce the speed.  
- Use an encoder with a lower pulse number (p0408).

---

**232153 <location>Encoder 2: Identification error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** An error has occurred when identifying the encoder (waiting) p0400 = 10100.  
The connected encoder was not able to be identified.  
Fault value (r0949, interpret binary):  
Bit 0: Data length incorrect.  
See also:p0400 (Encoder type selection)

**Remedy:** Manually configure the encoder according to the data sheet.

---

**232160 <location>Encoder 2: Analog sensor channel A failed**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE)  
Hla: OFF1 (NONE)

**Acknowledge:** PULSE INHIBIT

**Cause:** The input voltage of the analog sensor is outside the permissible limits.  
Fault value (r0949, interpret decimal):  
1: Input voltage outside detectable measuring range.  
2: Input voltage outside the measuring range set in (p4673).  
3: The absolute value of the input voltage has exceeded the range limit (p4676).

**Remedy:** For fault value = 1:  
- check the output voltage of the analog sensor.  
For fault value = 2:  
- check the voltage setting for each encoder period (p4673).  
For fault value = 3:  
- check the range limit setting and increase it if necessary (p4676).

---

**232161 <location>Encoder 2: Analog sensor channel B failed**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE)  
Hla: OFF1 (NONE)

**Acknowledge:** PULSE INHIBIT

**Cause:** The input voltage of the analog sensor is outside the permissible limits.  
Fault value (r0949, interpret decimal):  
1: Input voltage outside detectable measuring range.  
2: Input voltage outside the selected measuring range (p4675).  
3: The absolute value of the input voltage has exceeded the range limit (p4676).

**Remedy:**

- For fault value = 1:
  - check the output voltage of the analog sensor.
- For fault value = 2:
  - check the voltage setting for each encoder period (p4675).
- For fault value = 3:
  - check the range limit setting and increase it if necessary (p4676).

---

### **232163      <location>Encoder 2: Analog sensor position value exceeds limit value**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE)  
Hla: OFF1 (NONE)

**Acknowledge:** PULSE INHIBIT

**Cause:** The position value has exceeded the permissible range of -0.5 ... +0.5.  
Fault value (r0949, interpret decimal):  
1: Position value from the LVDT sensor.  
2: Position value from the encoder characteristic.

**Remedy:**

- For fault value = 1:
  - check the LVDT ratio (p4678).
  - check the reference signal connection at track B.
- For fault value = 2:
  - check the coefficients of the characteristic (p4663 ... p4666).

---

### **232400      <location>Encoder 2: Zero mark distance error (alarm threshold exceeded)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The measured zero mark distance does not correspond to the parameterized zero mark distance.  
For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.  
The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).  
Alarm value (r2124, interpret decimal):  
Last measured zero mark distance in increments (4 increments = 1 encoder pulse).  
The sign designates the direction of motion when detecting the zero mark distance.

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- check the encoder type (encoder with equidistant zero marks).
- adapt the parameter for the distance between zero marks (p0424, p0425).
- replace the encoder or encoder cable.

---

### **232401      <location>Encoder 2: Zero mark failed (alarm threshold exceeded)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The 1.5x parameterized zero mark distance was exceeded without a zero mark being detected.  
The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).  
Alarm value (r2124, interpret decimal):  
Number of increments after POWER ON or since the last zero mark that was detected (4 increments = 1 encoder pulse).

- Remedy:**
- check that the encoder cables are routed in compliance with EMC.
  - check the plug connections.
  - check the encoder type (encoder with equidistant zero marks).
  - adapt the parameter for the clearance between zero marks (p0425).
  - replace the encoder or encoder cable.

---

**232405 <location>Encoder 2: Temperature in the encoder evaluation exceeded**

- Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI
- Message value:** temperature: [0.1 degrees C] %1, temperature sensor number: %2
- Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)
- Acknowledge:** IMMEDIATELY (POWER ON)
- Cause:** An inadmissibly high temperature was detected in the encoder electronics or the encoder evaluation.  
Fault value (r0949, interpret hexadecimal):  
yyxxxx hex: yy = temperature sensor number, xxxx = measured module temperature in 0.1 °C.
- Remedy:** Reduce the ambient temperature for the DRIVE-CLiQ connection of the motor.

---

**232407 <location>Encoder 2: Function limit reached**

- Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI
- Message value:** %1
- Reaction:** NONE
- Acknowledge:** NONE
- Cause:** The encoder has reached one of its function limits. A service is recommended.  
Alarm value (r2124, interpret decimal):  
1: Incremental signals  
3: Absolute track  
4: Code connection
- Remedy:** Perform service. Replace the encoder if necessary.  
Note:  
The actual functional reserve of an encoder can be displayed via r4651.  
See also: p4650 (Encoder functional reserve component number), r4651 (Encoder functional reserve)

### 232412 <location>Encoder 2: Encoder signals an internal alarm

|                       |                                 |
|-----------------------|---------------------------------|
| <b>Drive object:</b>  | HLA_828, SERVO_828, SERVO_COMBI |
| <b>Message value:</b> | %1                              |
| <b>Reaction:</b>      | NONE                            |
| <b>Acknowledge:</b>   | NONE                            |

- Cause:** The encoder signals an internal alarm via serial protocol.  
Alarm value (r2124, interpret binary):  
Bit 0: Fault bit in the position protocol.  
Bit 1: Alarm bit in the position protocol.
- Remedy:**
- carry out a POWER ON (switch-off/switch-on) for all components.
  - check that the encoder cables are routed in compliance with EMC.
  - check the plug connections.
  - replace encoder.

---

**232414 <location>Encoder 2: Signal level track C or D out of tolerance**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** C track: %1, D track: %2

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The signal level ( $C^2 + D^2$ ) of track C or D of the encoder or from the Hall signals, is not within the tolerance bandwidth.  
Alarm value (r2124, interpret hexadecimal):  
yyyyxxxx hex:  
yyyy = Signal level, track D (16 bits with sign).  
xxxx = Signal level, track C (16 bits with sign).  
The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).  
The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV.  
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.  
**Note:**

If the amplitude is not within the tolerance bandwidth, then it cannot be used to initialize the start position.

**Remedy:**

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).
- check the Hall sensor box.

---

**232415 <location>Encoder 2: Signal level track A or B outside tolerance (alarm)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Amplitude: %1, Angle: %2

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The signal level (root from  $A^2 + B^2$ ) of the encoder is outside the permissible tolerance.

Alarm value (r2124, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Angle

xxxx = amplitude, i.e. root of  $A^2 + B^2$  (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is < 230 mV (observe the frequency response of the encoder).

A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

**Note for Sensor Modules for resolvers (e.g. SMC10):**

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).

A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.

**Note:**

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

- Remedy:**
- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range.
  - check that the encoder cables and shielding are routed in compliance with EMC.
  - check the plug connections.
  - replace the encoder or encoder cable.
  - check the Sensor Module (e.g. contacts).
  - if the coding disk is soiled or the lighting aged, replace the encoder.

---

### 232418 <location>Encoder 2: Speed change not plausible (alarm)

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** For an HTL/TTL encoder, the speed change has exceeded the value in p0492 over several sampling cycles.  
The change to the averaged speed actual value - if applicable - is monitored in the current controller sampling time.  
Alarm value (r2124, interpret decimal):  
Only for internal Siemens troubleshooting.  
See also:p0492

- Remedy:**
- check the tachometer feeder cable for interruptions.
  - check the grounding of the tachometer shielding.
  - if required, increase the setting of p0492.

---

### 232419 <location>Encoder 2: Track A or B outside tolerance

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The amplitude/phase/offset correction for track A or B is at the limit.  
Amplitude error correction: Amplitude B / Amplitude A = 0.78 ... 1.27  
Phase: <84 degrees or >96 degrees  
SMC20: Offset correction: +/-140 mV  
SMC10: Offset correction: +/-650 mV  
Alarm value (r2124, interpret hexadecimal):  
xxxx1: Minimum of the offset correction, track B  
xxxx2: Maximum of the offset correction, track B  
xxx1x: Minimum of the offset correction, track A  
xxx2x: Maximum of the offset correction, track A  
xx1xx: Minimum of the amplitude correction, track B/A  
xx2xx: Maximum of the amplitude correction, track B/A  
x1xxx: Minimum of the phase error correction  
x2xxx: Maximum of the phase error correction  
1xxxx: Minimum of the cubic correction  
2xxxx: Maximum of the cubic correction

- Remedy:**
- check mechanical mounting tolerances for encoders without their own bearings (e.g. toothed-wheel encoders).
  - check the plug connections (also the transition resistance).
  - check the encoder signals.
  - replace the encoder or encoder cable.

---

### 232421 <location>Encoder 2: Determined commutation position incorrect (alarm)

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

- Cause:** The unipolar level (CP/CN or DP/DN) for encoder 2 is outside the permissible tolerance.  
Alarm value (r2124, interpret binary):  
Bit 0 = 1: Either CP or CN outside the tolerance.  
Bit 16 = 1: Either DP or DN outside the tolerance.  
The unipolar nominal signal level of the encoder must lie in the range 2500 mV +/- 500 mV.  
The response thresholds are < 1700 mV and > 3300 mV.  
Note:  
The signal level is not evaluated unless the following conditions are satisfied:  
- Sensor Module properties available (r0459.31 = 1).  
- monitoring active (p0437.31 = 1).
- Remedy:** - check that the encoder cables and shielding are routed in compliance with EMC.  
- check the plug connections and contacts of the encoder cable.  
- are the C/D tracks connected correctly (have the signal cables CP and CN or DP and DN been interchanged)?  
- replace the encoder cable.

---

**232460 <location>Encoder 2: Analog sensor channel A failed**

- Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE
- Cause:** The input voltage of the analog sensor is outside the permissible limits.  
Alarm value (r2124, interpret decimal):  
1: Input voltage outside detectable measuring range.  
2: Input voltage outside measuring range set in p4673.  
3: The absolute value of the input voltage has exceeded the range limit (p4676).
- Remedy:** For alarm value = 1:  
- check the output voltage of the analog sensor.  
For alarm value = 2:  
- check the voltage setting for each encoder period (p4673).  
For alarm value = 3:  
- check the range limit setting and increase it if necessary (p4676).

---

**232461 <location>Encoder 2: Analog sensor channel B failed**

- Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE
- Cause:** The input voltage of the analog sensor is outside the permissible limits.  
Alarm value (r2124, interpret decimal):  
1: Input voltage outside detectable measuring range.  
2: Input voltage outside the selected measuring range (p4675).  
3: The absolute value of the input voltage has exceeded the range limit (p4676).
- Remedy:** For alarm value = 1:  
- check the output voltage of the analog sensor.  
For alarm value = 2:  
- check the voltage setting for each encoder period (p4675).  
For alarm value = 3:  
- check the range limit setting and increase it if necessary (p4676).

| <b>Cause:</b>         | For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.<br>For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.<br>For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419). |
| <b>Remedy:</b>        | The fault should be resolved as follows:<br>- select encoder commissioning (p0010 = 4).<br>- reset the position tracking as follows (p0411.2 = 1).<br>- deselect encoder commissioning (p0010 = 0).<br>The fault should then be acknowledged and the absolute encoder adjusted.                                                                                                                                                                                                                                                                                                                                                               |

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**232800 <location>Encoder 2: Group signal**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** NONE

**Cause:** The motor encoder has detected at least one fault.

**Remedy:** Evaluates other actual messages.

---

**232801 <location>Encoder 2 DRIVE-CLiQ: Sign-of-life missing**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder involved.  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:** - check the electrical cabinet design and cable routing for EMC compliance  
- replace the component involved.

---

**232802 <location>Encoder 2: Time slice overflow**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A time slice overflow has occurred in encoder 2.  
Fault value (r0949, interpret hexadecimal):  
yx hex: y = function involved (Siemens-internal fault diagnostics), x = time slice involved  
x = 9:  
Time slice overflow of the fast (current controller clock cycle) time slice.  
x = A:  
Time slice overflow of the average time slice.  
x = C:  
Time slice overflow of the slow time slice.  
yx = 3E7:  
Timeout when waiting for SYNO (e.g. unexpected return to non-cyclic operation).

**Remedy:** Increase the current controller sampling time  
Note:  
For a current controller sampling time = 31.25 µs, use an SMx20 with Article No. 6SL3055-0AA00-5xA3.

| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Cause:</b>         | <p>The encoder serial number has changed. The change is only checked for encoders with serial number (e.g. EnDat encoders).</p> <p>- the encoder was replaced.</p> <p>Note:</p> <p>With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).</p> <p>When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).</p> <p>Proceed as follows to hide serial number monitoring:</p> <p>- set the following serial numbers for the corresponding Encoder Data Set: p0441 = FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.</p> |

**Remedy:** Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

---

**232812 <location>Encoder 2: Requested cycle or RX-/TX timing not supported**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A cycle requested from the Control Unit or RX/TX timing is not supported.

Fault value (r0949, interpret decimal):

0: Application cycle is not supported.

1: DRIVE-CLiQ cycle is not supported.

2: Distance between RX and TX instants in time too low.

3: TX instant in time too early.

**Remedy:** Carry out a POWER ON (switch-off/switch-on) for all components.

---

**232813 <location>Encoder 2: Hardware logic unit failed**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1 bin

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** PULSE INHIBIT

**Cause:** The logic unit of the DRIVE-CLiQ encoder has failed.

Fault value (r0949, interpret binary):

Bit 0: ALU watchdog has responded.

Bit 1: ALU has detected a sign-of-life error.

**Remedy:** When the error reoccurs, replace the encoder.

---

**232820 <location>Encoder 2 DRIVE-CLiQ: Telegram error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder concerned.

Fault cause:

1 (= 01 hex):

Checksum error (CRC error).

2 (= 02 hex):

Telegram is shorter than specified in the length byte or in the receive list.

3 (= 03 hex):

Telegram is longer than specified in the length byte or in the receive list.

4 (= 04 hex):

The length of the receive telegram does not match the receive list.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the component in the telegram and in the receive list do not match.

7 (= 07 hex):

A SYNC telegram is expected - but the received telegram is not a SYNC telegram.

8 (= 08 hex):

No SYNC telegram is expected - but the received telegram is one.

9 (= 09 hex):

The error bit in the receive telegram is set.

16 (= 10 hex):

The receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

---

## 232835 <location>Encoder 2 DRIVE-CLiQ: Cyclic data transfer error

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

HLA: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder concerned. The nodes do not send and receive in synchronism.

Fault cause:

33 (= 21 hex):

The cyclic telegram has not been received.

34 (= 22 hex):

Timeout in the telegram receive list.

64 (= 40 hex):

Timeout in the telegram send list.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON.
- replace the component involved.

---

**232836 <location>Encoder 2 DRIVE-CLiQ: Send error for DRIVE-CLiQ data****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** Component number: %1, fault cause: %2**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)**Acknowledge:** IMMEDIATELY**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder involved. Data were not able to be sent.

Fault cause:

65 (= 41 hex):

Telegram type does not match send list.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON.

---

**232837 <location>Encoder 2 DRIVE-CLiQ: Component fault****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** Component number: %1, fault cause: %2**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)**Acknowledge:** IMMEDIATELY**Cause:** Fault detected on the DRIVE-CLiQ component concerned. Faulty hardware cannot be excluded.

Fault cause:

32 (= 20 hex):

Error in the telegram header.

35 (= 23 hex):

Receive error: The telegram buffer memory contains an error.

66 (= 42 hex):

Send error: The telegram buffer memory contains an error.

67 (= 43 hex):

Send error: The telegram buffer memory contains an error.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).
- check the electrical cabinet design and cable routing for EMC compliance
- if required, use another DRIVE-CLiQ socket (p9904).
- replace the component involved.

---

**232860**      **<location>Encoder 2 DRIVE-CLiQ (CU): Telegram error****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** Component number: %1, fault cause: %2**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)**Acknowledge:** IMMEDIATELY**Cause:** A DRIVE-CLiQ communication error has occurred from the Sensor Module (encoder 2) involved to the Control Unit.

Fault cause:

1 (= 01 hex):

Checksum error (CRC error).

2 (= 02 hex):

Telegram is shorter than specified in the length byte or in the receive list.

3 (= 03 hex):

Telegram is longer than specified in the length byte or in the receive list.

4 (= 04 hex):

The length of the receive telegram does not match the receive list.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the power unit in the telegram and in the receive list do not match.

9 (= 09 hex):

The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.

16 (= 10 hex):

The receive telegram is too early.

17 (= 11 hex):

CRC error and the receive telegram is too early.

18 (= 12 hex):

The telegram is shorter than that specified in the length byte or in the receive list and the receive telegram is too early.

19 (= 13 hex):

The telegram is longer than that specified in the length byte or in the receive list and the receive telegram is too early.

20 (= 14 hex):

The length of the receive telegram does not match the receive list and the receive telegram is too early.

21 (= 15 hex):

The type of the receive telegram does not match the receive list and the receive telegram is too early.

22 (= 16 hex):

The address of the power unit in the telegram and in the receive list does not match and the receive telegram is too early.

25 (= 19 hex):

The error bit in the receive telegram is set and the receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

### 232896 <location>Encoder 2 DRIVE-CLiQ (CU): Inconsistent component properties

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1

**Reaction:** Servo: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)  
Hla: OFF2 (NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** The properties of the DRIVE-CLiQ component (Sensor Module for encoder 2), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.

Fault value (r0949, interpret decimal):

Component number.

**Remedy:**

- carry out a POWER ON.
- when a component is replaced, the same component type and if possible the same firmware version should be used.
- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

---

### 232899 <location>Encoder 2: Unknown fault

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** New message: %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A fault occurred on the Sensor Module for encoder 2 that cannot be interpreted by the Control Unit firmware. This can occur if the firmware on this component is more recent than the firmware on the Control Unit.

Fault value (r0949, interpret decimal):

Fault number.

Note:

If required, the significance of this new fault can be read about in a more recent description of the Control Unit.

**Remedy:**

- replace the firmware on the Sensor Module by an older firmware version (r0148).
- upgrade the firmware on the Control Unit (r0018).

---

### 232902 <location>Encoder 2: SPI-BUS error occurred

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Error when operating the internal SPI bus.  
Alarm value (r2124, interpret hexadecimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- replace the Sensor Module.
- if required, upgrade the firmware in the Sensor Module.
- contact Technical Support.

---

### 232903 <location>Encoder 2: I2C-BUS error occurred

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

- Cause:** Error when operating the internal I2C bus.  
Alarm value (r2124, interpret hexadecimal):  
Only for internal Siemens troubleshooting.
- Remedy:** - replace the Sensor Module.  
- if required, upgrade the firmware in the Sensor Module.  
- contact Technical Support.

---

**232905 <location>Encoder 2: Encoder parameterization error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Parameter: %1, supplementary information: %2

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

- Cause:** An error was identified in the encoder parameterization.  
It is possible that the parameterized encoder type does not match the connected encoder.  
The parameter involved can be determined as follows:
- determine the parameter number using the fault value (r0949).
  - determine the parameter index (p0187).
- Fault value (r0949, interpret decimal):  
yyyyxxxx dec: yyyy = supplementary information, xxxx = parameter  
xxxx = 421:
- For an EnDat/SSI encoder, the absolute position in the protocol must be less than or equal to 30 bits.
- yyyy = 0:  
No additional information available.
- yyyy = 1:  
The component does not support HTL level (p0405.1 = 0) combined with track monitoring A/B <> -A/B (p0405.2 = 1).
- yyyy = 2:  
A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please start a new encoder identification.
- yyyy = 3:  
A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please select a listed encoder in p0400 with a code number < 10000.
- yyyy = 4:  
This component does not support SSI encoders (p0404.9 = 1) without track A/B.
- yyyy = 5:  
For SQW encoder, value in p4686 greater than in p0425.
- yyyy = 6:  
DRIVE-CLiQ encoder cannot be used with this firmware version.
- yyyy = 7:  
For an SQW encoder, the XIST1 correction (p0437.2) is only permitted for equidistant zero marks.
- yyyy = 8:  
The motor pole pair width is not supported by the linear scale being used.
- yyyy = 9:  
The length of the position in the EnDat protocol may be a maximum of 32 bits.
- yyyy = 10:  
The connected encoder is not supported.
- yyyy = 11:  
The hardware does not support track monitoring.

- Remedy:**
- check whether the connected encoder type matches the encoder that has been parameterized.
  - correct the parameter specified by the fault value (r0949) and p0187.
  - re parameter number = 314:
  - check the pole pair number and measuring gear ratio. The quotient of the "pole pair number" divided by the "measuring gear ratio" must be less than or equal to 1000 ( $(r0313 * p0433) / p0432 \leq 1000$ ).

---

### 232912 <location>Encoder 2: Device combination is not permissible

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE)  
Hla: OFF1 (NONE)

**Acknowledge:** PULSE INHIBIT

**Cause:** The selected device combination is not supported.

Fault value (r0949, interpret decimal):

1003:

The connected measuring unit cannot be operated with the EnDat 2.2 converter. For instance, the measuring unit has a pulse number/resolution of  $2^n$ .

1005:

The type of measuring unit (incremental) is not supported by the EnDat 2.2 converter.

1006:

The maximum duration of the EnDat transfer (31.25  $\mu$ s) was exceeded.

2001:

The set combination of current controller cycle, DP cycle and Safety cycle is not supported by the EnDat 2.2 converter.

2002:

The resolution of the linear measuring unit does not match the pole pair width of the linear motor

Pole pair width, minimum =  $p0422 * 2^{20}$

**Remedy:**

For fault value = 1003, 1005, 1006:

- Use a measuring unit that is permissible.

For fault value = 2001:

- set a permissible cycle combination (if required, use standard settings).

For fault value = 2002:

- Use a measuring unit with a lower resolution (p0422).

---

### 232915 <location>Encoder 2: Encoder configuration error

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The configuration for encoder 2 is incorrect.

Alarm value (r2124, interpret decimal):

1:

Re-parameterization between fault/alarm is not permissible.

2:

The cyclic DQ receive telegram is too long and is limited.

3:

The cyclic DQ send telegram is too long and is limited.

419:

When the fine resolution Gx\_X1ST2 is configured, the encoder identifies a maximum possible absolute position actual value (r0483) that can no longer be represented within 32 bits.

**Remedy:** For alarm value = 1:  
No re-parameterization between fault/alarm.  
For alarm value = 419:  
Reduce the fine resolution (p0419) or deactivate the monitoring (p0437.25), if the complete multiturn range is not required.

---

**232916 <location>Encoder 2: Encoder parameterization error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Parameter: %1, supplementary information: %2

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** An encoder parameter was detected as being incorrect.  
It is possible that the parameterized encoder type does not match the connected encoder.  
The parameter involved can be determined as follows:  
- determine the parameter number using the fault value (r0949).  
- determine the parameter index (p0187).  
Fault value (r0949, interpret decimal):  
Parameter number.

**Remedy:** - check whether the connected encoder type matches the encoder that has been parameterized.  
- correct the parameter specified by the fault value (r0949) and p0187.

---

**232920 <location>Encoder 2: Temperature sensor fault (motor)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1, channel number: %2

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The motor detected a fault when evaluating the temperature sensor.  
Fault cause:  
1 (= 01 hex):  
Wire breakage or sensor not connected.  
KTY: R > 1630 Ohm, PT1000: R > 1720 Ohm  
2 (= 02 hex):  
Measured resistance too low.  
PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm  
Additional values:  
Only for internal Siemens troubleshooting.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = channel number, xx = error cause

**Remedy:** - check that the encoder cable is the correct type and is correctly connected.  
- check the temperature sensor selection in p0600 to p0603.  
- replace the Sensor Module (hardware defect or incorrect calibration data).

---

**232930 <location>Encoder 2: Data logger has saved data**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Cause:</b>         | The measured zero mark distance does not correspond to the parameterized zero mark distance.<br>For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.<br>The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).<br>Fault value (r0949, interpret decimal):<br>Last measured zero mark distance in increments (4 increments = 1 encoder pulse).<br>The sign designates the direction of motion when detecting the zero mark distance. |
| <b>Remedy:</b>        | <ul style="list-style-type: none"><li>- check that the encoder cables are routed in compliance with EMC.</li><li>- check the plug connections.</li><li>- check the encoder type (encoder with equidistant zero marks).</li><li>- adapt the parameter for the distance between zero marks (p0424, p0425).</li><li>- if message output above speed threshold, reduce filter time if necessary (p0438).</li><li>- replace the encoder or encoder cable.</li></ul>                                                                                                                                                                                                                             |

| <b>Cause:</b>         | The encoder signals a set error bit via the serial protocol.<br>Fault value (r0949, interpret binary):<br>Bit 0: Fault bit in the position protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Remedy:** For fault value, bit 0 = 1:  
In the case of an EnDat encoder, F31111 may provide further details.

---

**233115 <location>Encoder 3: Signal level track A or B too low**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** A track: %1, B-track: %2

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** PULSE INHIBIT

**Cause:** The signal level (root from  $A^2 + B^2$ ) of the encoder falls below the permissible limit value.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track B (16 bits with sign).

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is < 170 mV (input frequency <= 256 kHz) or < 120 mV (input frequency > 256 kHz).

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1070 mV.

A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:**

- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check the Sensor Module (e.g. contacts).

The following applies to measuring systems without their own bearing system:

- adjust the scanning head and check the bearing system of the measuring wheel.

The following applies for measuring systems with their own bearing system:

- ensure that the encoder housing is not subject to any axial force.

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The signal level of the rectified encoder signals A and B of the encoder fall below the permissible limit value.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Signal level, track B (16 bits with sign).

xxxx = Signal level, track A (16 bits with sign).

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is < 130 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

- Remedy:**
- check that the encoder cables and shielding are routed in compliance with EMC.
  - check the plug connections.
  - replace the encoder or encoder cable.
  - check the Sensor Module (e.g. contacts).

---

### 233117 <location>Encoder 3: Inversion error signals A/B/R

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1 bin

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** For a square-wave encoder (bipolar, double ended) signals A\*, B\* and R\* are not inverted with respect to signals A, B and R.

Fault value (r0949, interpret binary):

Bits 0 ... 15: Only for internal Siemens troubleshooting.

Bit 16: Error track A.

Bit 17: Error track B.

Bit 18: Error track R.

Note:

For SMC30 (only Article No. 6SL3055-0AA00-5CA0 and 6SL3055-0AA00-5CA1), CUA32 and CU310-2, the following applies:

A square-wave encoder without track R is used and track monitoring (p0405.2 = 1) is activated.

**Remedy:** - check the encoder/cable.

- Does the encoder supply signals and the associated inverted signals?

Note:

For SMC30 (only Article Number 6SL3055-0AA00-5CA0 and 6SL3055-0AA00-5CA1), the following applies:

- check the setting of p0405 (p0405.2 = 1 is only possible if the encoder is connected at X520).

For a square-wave encoder without track R, the following jumpers must be set for the connection at X520 (SMC30), X220 (CUA32) or X23 (CU310-2):

- pin 10 (reference signal R) <--> pin 7 (encoder power supply, ground)

- pin 11 (reference signal R inverted) <--> pin 4 (encoder power supply)

---

### 233118 <location>Encoder 3: Speed change not plausible

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** PULSE INHIBIT

**Cause:** For an HTL/TTL encoder, the speed change has exceeded the value in p0492 over several sampling cycles.

The change to the averaged speed actual value - if applicable - is monitored in the current controller sampling time.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

See also:p0492

**Remedy:** - check the tachometer feeder cable for interruptions.

- check the grounding of the tachometer shielding.

- if required, increase the maximum speed difference per sampling cycle (p0492).

---

### 233120 <location>Encoder 3: Encoder power supply fault

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1 bin

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** PULSE INHIBIT

**Cause:** An encoder power supply fault was detected.

Fault value (r0949, interpret binary):

Bit 0: Undervoltage condition on the sense line.

Bit 1: Overcurrent condition for the encoder power supply.

Bit 2: Overcurrent condition for encoder power supply on cable resolver excitation negative.

Bit 3: Overcurrent condition for encoder power supply on cable resolver excitation positive.

Bit 4: The 24 V power supply through the Power Module (PM) is overloaded.

Bit 5: Overcurrent at the EnDat connection of the converter.

Bit 6: Overvoltage at the EnDat connection of the converter.

Bit 7: Hardware fault at the EnDat connection of the converter.

Note:

If the encoder cables 6FX2002-2EQ00-.... and 6FX2002-2CH00-.... are interchanged, this can result in the encoder being destroyed because the pins of the operating voltage are reversed.

**Remedy:** For fault value, bit 0 = 1:

- correct encoder cable connected?
- check the plug connections of the encoder cable.
- SMC30: Check the parameterization (p0404.22).

For fault value, bit 1 = 1:

- correct encoder cable connected?
- replace the encoder or encoder cable.

For fault value, bit 2 = 1:

- correct encoder cable connected?
- replace the encoder or encoder cable.

For fault value, bit 3 = 1:

- correct encoder cable connected?
- replace the encoder or encoder cable.

For fault value, bit 5 = 1:

- Measuring unit correctly connected at the converter?
- Replace the measuring unit or the cable to the measuring unit.

For fault value, bit 6, 7 = 1:

- Replace the defective EnDat 2.2 converter.

---

### 233121 <location>Encoder 3: Determined commutation position incorrect

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** PULSE INHIBIT

**Cause:** A commutation position actual value sensing error was detected.

**Remedy:** Replace the motor with DRIVE-CLiQ or the appropriate Sensor Module.

---

### 233122 <location>Encoder 3: Sensor Module hardware fault

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF1

**Acknowledge:** IMMEDIATELY

**Cause:** An internal Sensor Module hardware fault was detected.

Fault value (r0949, interpret decimal):

1: Reference voltage error.

2: Internal undervoltage.

3: Internal overvoltage.

**Remedy:** Replace the motor with DRIVE-CLiQ or the appropriate Sensor Module.

---

### 233123 <location>Encoder 3: Signal level A/B outside tolerance

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1 bin

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The unipolar level (AP/AN or BP/BN) for encoder 3 is outside the permissible tolerance.  
Fault value (r0949, interpret binary):  
Bit 0 = 1: Either AP or AN outside the tolerance.  
Bit 16 = 1: Either BP or BN outside the tolerance.  
The unipolar nominal signal level of the encoder must lie in the range 2500 mV +/- 500 mV.  
The response thresholds are < 1700 mV and > 3300 mV.  
Note:  
The signal level is not evaluated unless the following conditions are satisfied:  
- Sensor Module properties available (r0459.31 = 1).  
- monitoring active (p0437.31 = 1).

**Remedy:** - make sure that the encoder cables and shielding are installed in an EMC-compliant manner.  
- check the plug connections and contacts of the encoder cable.  
- check the short-circuit of a signal cable with mass or the operating voltage.  
- replace the encoder cable.

---

### 233125 <location>Encoder 3: Signal level track A or B too high

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** A track: %1, B-track: %2

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** The signal level (root from  $A^2 + B^2$ ) of the encoder exceeds the permissible limit value.  
Fault value (r0949, interpret hexadecimal):  
yyyyxxxx hex:  
yyyy = Signal level, track B (16 bits with sign).  
xxxx = Signal level, track A (16 bits with sign).  
The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).  
The response threshold is > 750 mV.  
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.  
Note for Sensor Modules for resolvers (e.g. SMC10):  
The nominal signal level is at 2900 mV (2.0 Vrms).  
The response threshold is > 3582 mV.  
A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.  
Note:  
The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

**Remedy:** - check that the encoder cables and shielding are routed in compliance with EMC.  
- replace the encoder or encoder cable.

---

### 233126 <location>Encoder 3: Signal level track A or B too high

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Amplitude: %1, Angle: %2

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**233137      <location>Encoder 3: Fault when determining the position (singleturn)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1 bin

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** PULSE INHIBIT

**Cause:** A position determination fault has occurred in the DRIVE-CLiQ encoder.  
 Fault value (r0949, interpret binary):  
 yyyyyxxx hex: yy = encoder version, xxxxxx = bit coding of the fault cause

-----  
 For yy = 8 (0000 1000 bin), the following applies:

Bit 1: Signal monitoring (sin/cos).  
 Bit 8: F1 (safety status display) error position word 1.  
 Bit 9: F2 (safety status display) error position word 2.  
 Bit 16: LED monitoring.  
 Bit 17: Fault when determining the position (multiturn).  
 Bit 18: Single-step capability monitoring singleturn from the Safety channel.  
 Bit 19: ECRC, configuration error in the safety channel.  
 Bit 23: Temperature outside the limit values.

-----  
 For yy = 11 (0000 1011 bin), the following applies:

Bit 0: Position word 1 difference between rotation counter and software counter (XC\_ERR).  
 Bit 1: Position word 1 track error of the incremental signals (LIS\_ERR).  
 Bit 2: Position word 1 error when aligning between incremental track signals and absolute value (ST\_ERR).  
 Bit 3: Maximum permissible temperature exceeded (TEMP\_ERR).  
 Bit 4: Power supply overvoltage (MON\_OVR\_VOLT).  
 Bit 5: Power supply overcurrent (MON\_OVR\_CUR).  
 Bit 6: Power supply undervoltage (MON\_UND\_VOLT).  
 Bit 7: Rotation error counter (MT\_ERR).  
 Bit 8: F1 (safety status display) error position word 1.  
 Bit 9: F2 (safety status display) error position word 2.  
 Bit 11: Position word 1 status bit: singleturn position OK (ADC\_ready).  
 Bit 12: Position word 1 status bit: rotation counter OK (MT\_ready).  
 Bit 13: Position word 1 memory error (MEM\_ERR).  
 Bit 14: Position word 1 absolute position error (MLS\_ERR).  
 Bit 15: position word 1 LED error, lighting unit error (LED\_ERR).  
 Bit 18: Position word 2 error when aligning between incremental track signals and absolute value (ST\_ERR).  
 Bit 21: Position word 2 memory error (MEM\_ERR).  
 Bit 22: Position word 2 absolute position error (MLS\_ERR).  
 Bit 23: position word 2 LED error, lighting unit error (LED\_ERR).

-----  
 For yy = 12 (0000 1100 bin), the following applies:

Bit 8: encoder fault.  
 Bit 10: error in the internal position data transport.

-----  
 For yy = 14 (0000 1110 bin), the following applies:

Bit 0: Position word 1 temperature outside limit value.  
 Bit 1: Position word 1 position determination error (multiturn).  
 Bit 2: Position word 1 FPGA error.  
 Bit 3: Position word 1 velocity error.  
 Bit 4: Position word 1 communication error between FPGAs/error in the incremental signal.  
 Bit 5: Position word 1 timeout absolute value/error when determining the position (singleturn).  
 Bit 6: Position word 1 internal hardware fault (clock/power monitor IC/power).  
 Bit 7: Position word 1 internal error (FPGA communication/FPGA parameterization/self-test/software).  
 Bit 8: F1 (safety status display) error position word 1.  
 Bit 9: F2 (safety status display) error position word 2.  
 Bit 16: Position word 2 temperature outside limit value.  
 Bit 17: Position word 2 position determination error (multiturn).

- Bit 18: Position word 2 FPGA error.
- Bit 19: Position word 2 velocity error.
- Bit 20: Position word 2 communication error between FPGAs.
- Bit 21: Position word 2 position determination error (singleturn).
- Bit 22: Position word 2 internal hardware fault (clock/power monitor IC/power).
- Bit 23: Position word 2 internal error (self-test/software).

-----  
Note:  
For an encoder version that is not described here, please contact the encoder manufacturer for more detailed information on the bit coding.

**Remedy:**

- determine the detailed cause of the fault using the fault value.
- if required, replace the DRIVE-CLiQ encoder.

---

**233138      <location>Encoder 3: Fault when determining the position (multiturn)**

**Drive object:**    HLA\_828, SERVO\_828, SERVO\_COMBI

 Bit 19: Position word 2 velocity error.  
 Bit 20: Position word 2 communication error between FPGAs.  
 Bit 21: Position word 2 position determination error (singleturn).  
 Bit 22: Position word 2 internal hardware fault (clock/power monitor IC/power).

Bit 23: Position word 2 internal error (self-test/software).

-----

**Note:**

For an encoder version that is not described here, please contact the encoder manufacturer for more detailed information on the bit coding.

**Remedy:**

- determine the detailed cause of the fault using the fault value.
- if required, replace the DRIVE-CLiQ encoder.

---

**233142 <location>Encoder 3: Battery voltage fault**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** When switched-off, the encoder uses a battery to back up the multturn information. The battery voltage is no longer sufficient to check the multturn information.

**Remedy:** Replace battery.

---

**233150 <location>Encoder 3: Initialization error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** Encoder functionality selected in p0404 cannot be executed.  
Fault value (r0949, interpret hexadecimal):  
Encoder malfunction.  
The bit assignment corresponds to that of p0404 (e.g. bit 5 set: Error track C/D).

**Remedy:**

- check that p0404 is correctly set.
- check the encoder type used (incremental/absolute) and for SMCxx, the encoder cable.
- if relevant, note additional fault messages that describe the fault in detail.

---

**233151 <location>Encoder 3: Encoder speed for initialization AB too high**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

**Cause:** The encoder speed is too high while initializing the Sensor Module.

**Remedy:** Reduce the speed of the encoder accordingly during initialization.  
If necessary, deactivate monitoring (p0437.29).  
See also:p0437 (Sensor Module configuration extended)

---

**233152 <location>Encoder 3: Max. signal frequency (track A/B) exceeded**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** PULSE INHIBIT

| <b>Message value:</b> | %1                                                                                                                                                                                                                                                                                                                                 |
| <b>Reaction:</b>      | Servo: OFF1 (IASC/DCBRK, NONE)<br>Hla: OFF1 (NONE)                                                                                                                                                                                                                                                                                 |
| <b>Acknowledge:</b>   | PULSE INHIBIT                                                                                                                                                                                                                                                                                                                      |
| <b>Cause:</b>         | The input voltage of the analog sensor is outside the permissible limits.<br>Fault value (r0949, interpret decimal):<br>1: Input voltage outside detectable measuring range.<br>2: Input voltage outside the selected measuring range (p4675).<br>3: The absolute value of the input voltage has exceeded the range limit (p4676). |

---

**Remedy:** For fault value = 1:  
- check the output voltage of the analog sensor.  
For fault value = 2:  
- check the voltage setting for each encoder period (p4675).  
For fault value = 3:  
- check the range limit setting and increase it if necessary (p4676).

---

**233163 <location>Encoder 3: Analog sensor position value exceeds limit value**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE)  
Hla: OFF1 (NONE)  
**Acknowledge:** PULSE INHIBIT  
**Cause:** The position value has exceeded the permissible range of -0.5 ... +0.5.  
Fault value (r0949, interpret decimal):  
1: Position value from the LVDT sensor.  
2: Position value from the encoder characteristic.  
**Remedy:** For fault value = 1:  
- check the LVDT ratio (p4678).  
- check the reference signal connection at track B.  
For fault value = 2:  
- check the coefficients of the characteristic (p4663 ... p4666).

---

**233400 <location>Encoder 3: Zero mark distance error (alarm threshold exceeded)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The measured zero mark distance does not correspond to the parameterized zero mark distance.  
For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.  
The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).  
Alarm value (r2124, interpret decimal):  
Last measured zero mark distance in increments (4 increments = 1 encoder pulse).  
The sign designates the direction of motion when detecting the zero mark distance.  
**Remedy:** - check that the encoder cables are routed in compliance with EMC.  
- check the plug connections.  
- check the encoder type (encoder with equidistant zero marks).  
- adapt the parameter for the distance between zero marks (p0424, p0425).  
- replace the encoder or encoder cable.

---

**233401 <location>Encoder 3: Zero mark failed (alarm threshold exceeded)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The 1.5x parameterized zero mark distance was exceeded without a zero mark being detected.  
The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).  
Alarm value (r2124, interpret decimal):  
Number of increments after POWER ON or since the last zero mark that was detected (4 increments = 1 encoder pulse).

- Remedy:**
- check that the encoder cables are routed in compliance with EMC.
  - check the plug connections.
  - check the encoder type (encoder with equidistant zero marks).
  - adapt the parameter for the clearance between zero marks (p0425).
  - replace the encoder or encoder cable.

---

#### **233405      <location>Encoder 3: Temperature in the encoder evaluation exceeded**

- Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI
- Message value:** temperature: [0.1 degrees C] %1, temperature sensor number: %2
- Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)
- Acknowledge:** IMMEDIATELY (POWER ON)
- Cause:** An inadmissibly high temperature was detected in the encoder electronics or the encoder evaluation.  
Fault value (r0949, interpret hexadecimal):  
yyxxxx hex: yy = temperature sensor number, xxxx = measured module temperature in 0.1 °C.
- Remedy:** Reduce the ambient temperature for the DRIVE-CLiQ connection of the motor.

---

#### **233407      <location>Encoder 3: Function limit reached**

- Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI
- Message value:** %1
- Reaction:** NONE
- Acknowledge:** NONE
- Cause:** The encoder has reached one of its function limits. A service is recommended.  
Alarm value (r2124, interpret decimal):  
1: Incremental signals  
3: Absolute track  
4: Code connection
- Remedy:** Perform service. Replace the encoder if necessary.  
Note:  
The actual functional reserve of an encoder can be displayed via r4651.  
See also: p4650 (Encoder functional reserve component number), r4651 (Encoder functional reserve)

---

#### **233410      <location>Encoder 3: Communication error (encoder and Sensor Module)**

- Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI
- Message value:** Fault cause: %1 bin
- Reaction:** NONE
- Acknowledge:** NONE

| <b>Reaction:</b>      | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Cause:</b>         | The signal level (root from $A^2 + B^2$ ) of the encoder is outside the permissible tolerance.<br>Alarm value (r2124, interpret hexadecimal):<br>yyyyxxxx hex:<br>yyyy = Angle<br>xxxx = amplitude, i.e. root of $A^2 + B^2$ (16 bits without sign)<br>The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).<br>The response threshold is < 230 mV (observe the frequency response of the encoder).<br>A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.<br>The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.<br>Note for Sensor Modules for resolvers (e.g. SMC10):<br>The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).<br>A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.<br>Note:<br>The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module. |

- Remedy:**
- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range.
  - check that the encoder cables and shielding are routed in compliance with EMC.
  - check the plug connections.
  - replace the encoder or encoder cable.
  - check the Sensor Module (e.g. contacts).
  - if the coding disk is soiled or the lighting aged, replace the encoder.

---

**233418 <location>Encoder 3: Speed change not plausible (alarm)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** For an HTL/TTL encoder, the speed change has exceeded the value in p0492 over several sampling cycles.  
The change to the averaged speed actual value - if applicable - is monitored in the current controller sampling time.  
Alarm value (r2124, interpret decimal):  
Only for internal Siemens troubleshooting.  
See also:p0492

- Remedy:**
- check the tachometer feeder cable for interruptions.
  - check the grounding of the tachometer shielding.
  - if required, increase the setting of p0492.

---

**233419 <location>Encoder 3: Track A or B outside tolerance**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The amplitude/phase/offset correction for track A or B is at the limit.  
Amplitude error correction:  $\text{Amplitude B} / \text{Amplitude A} = 0.78 \dots 1.27$   
Phase: <84 degrees or >96 degrees  
SMC20: Offset correction: +/-140 mV  
SMC10: Offset correction: +/-650 mV  
Alarm value (r2124, interpret hexadecimal):  
xxxx1: Minimum of the offset correction, track B  
xxxx2: Maximum of the offset correction, track B  
xxx1x: Minimum of the offset correction, track A  
xxx2x: Maximum of the offset correction, track A  
xx1xx: Minimum of the amplitude correction, track B/A  
xx2xx: Maximum of the amplitude correction, track B/A  
x1xxx: Minimum of the phase error correction  
x2xxx: Maximum of the phase error correction  
1xxxx: Minimum of the cubic correction  
2xxxx: Maximum of the cubic correction

- Remedy:**
- check mechanical mounting tolerances for encoders without their own bearings (e.g. toothed-wheel encoders).
  - check the plug connections (also the transition resistance).
  - check the encoder signals.
  - replace the encoder or encoder cable.

---

**233421 <location>Encoder 3: Determined commutation position incorrect (alarm)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

- Cause:** The unipolar level (CP/CN or DP/DN) for encoder 3 is outside the permissible tolerance.  
 Alarm value (r2124, interpret binary):  
 Bit 0 = 1: Either CP or CN outside the tolerance.  
 Bit 16 = 1: Either DP or DN outside the tolerance.  
 The unipolar nominal signal level of the encoder must lie in the range 2500 mV +/- 500 mV.  
 The response thresholds are < 1700 mV and > 3300 mV.  
 Note:  
 The signal level is not evaluated unless the following conditions are satisfied:  
 - Sensor Module properties available (r0459.31 = 1).  
 - monitoring active (p0437.31 = 1).
- Remedy:**
- check that the encoder cables and shielding are routed in compliance with EMC.
  - check the plug connections and contacts of the encoder cable.
  - are the C/D tracks connected correctly (have the signal cables CP and CN or DP and DN been interchanged)?
  - replace the encoder cable.

---

### 233460 <location>Encoder 3: Analog sensor channel A failed

- Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI
- Message value:** %1
- Reaction:** NONE
- Acknowledge:** NONE
- Cause:** The input voltage of the analog sensor is outside the permissible limits.  
 Alarm value (r2124, interpret decimal):  
 1: Input voltage outside detectable measuring range.  
 2: Input voltage outside measuring range set in p4673.  
 3: The absolute value of the input voltage has exceeded the range limit (p4676).
- Remedy:**
- For alarm value = 1:  
 - check the output voltage of the analog sensor.
- For alarm value = 2:  
 - check the voltage setting for each encoder period (p4673).
- For alarm value = 3:  
 - check the range limit setting and increase it if necessary (p4676).

---

### 233461 <location>Encoder 3: Analog sensor channel B failed

- Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI
- Message value:** %1
- Reaction:** NONE
- Acknowledge:** NONE
- Cause:** The input voltage of the analog sensor is outside the permissible limits.  
 Alarm value (r2124, interpret decimal):  
 1: Input voltage outside detectable measuring range.  
 2: Input voltage outside the selected measuring range (p4675).  
 3: The absolute value of the input voltage has exceeded the range limit (p4676).
- Remedy:**
- For alarm value = 1:  
 - check the output voltage of the analog sensor.
- For alarm value = 2:  
 - check the voltage setting for each encoder period (p4675).
- For alarm value = 3:  
 - check the range limit setting and increase it if necessary (p4676).

---

**233462 <location>Encoder 3: Analog sensor no channel active**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** Channel A and B are not activated for the analog sensor.  
**Remedy:**  
- activate channel A and/or channel B (p4670).  
- check the encoder configuration (p0404.17).  
See also: p4670 (Analog sensor configuration)

---

**233463 <location>Encoder 3: Analog sensor position value exceeds limit value**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The position value has exceeded the permissible range of -0.5 ... +0.5.  
Alarm value (r2124, interpret decimal):  
1: Position value from the LVDT sensor.  
2: Position value from the encoder characteristic.  
**Remedy:**  
For alarm value = 1:  
- check the LVDT ratio (p4678).  
- check the reference signal connection at track B.  
For alarm value = 2:  
- check the coefficients of the characteristic (p4663 ... p4666).

---

**233470 <location>Encoder 3: Encoder signals an internal error (X521.7)**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** For the Sensor Module Cabinet 30 (SMC30), a dirty encoder is signaled via a 0 signal at terminal X521.7.  
**Remedy:**  
- check the plug connections.  
- replace the encoder or encoder cable.

---

**233500 <location>Encoder 3: Position tracking traversing range exceeded**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.  
For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.  
For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/- p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).  
**Remedy:** The fault should be resolved as follows:  
- select encoder commissioning (p0010 = 4).  
- reset the position tracking as follows (p0411.2 = 1).  
- deselect encoder commissioning (p0010 = 0).  
The fault should then be acknowledged and the absolute encoder adjusted.

**233800 <location>Encoder 3: Group signal**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** NONE  
**Cause:** The motor encoder has detected at least one fault.  
**Remedy:** Evaluate the other messages that are presently available.

---

**233801 <location>Encoder 3 DRIVE-CLiQ: Sign-of-life missing**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** Component number: %1, fault cause: %2  
**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder involved.  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause  
**Remedy:** - check the electrical cabinet design and cable routing for EMC compliance  
- replace the component involved.

---

**233802 <location>Encoder 3: Time slice overflow**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A time slice overflow has occurred in encoder 3.  
Fault value (r0949, interpret hexadecimal):  
yx hex: y = function involved (Siemens-internal fault diagnostics), x = time slice involved  
x = 9:  
Time slice overflow of the fast (current controller clock cycle) time slice.  
x = A:  
Time slice overflow of the average time slice.  
x = C:  
Time slice overflow of the slow time slice.  
yx = 3E7:  
Timeout when waiting for SYNO (e.g. unexpected return to non-cyclic operation).  
**Remedy:** Increase the current controller sampling time  
Note:  
For a current controller sampling time = 31.25 µs, use an SMx20 with Article No. 6SL3055-0AA00-5xA3.

| <b>Cause:</b>         | <p>The encoder serial number has changed. The change is only checked for encoders with serial number (e.g. EnDat encoders).</p> <p>- the encoder was replaced.</p> <p>Note:</p> <p>With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).</p> <p>When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).</p> <p>Proceed as follows to hide serial number monitoring:</p> <p>- set the following serial numbers for the corresponding Encoder Data Set: p0441 = FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.</p> |

**Remedy:** Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

---

### 233812 <location>Encoder 3: Requested cycle or RX-/TX timing not supported

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A cycle requested from the Control Unit or RX/TX timing is not supported.

Fault value (r0949, interpret decimal):

0: Application cycle is not supported.

1: DRIVE-CLiQ cycle is not supported.

2: Distance between RX and TX instants in time too low.

3: TX instant in time too early.

**Remedy:** Carry out a POWER ON (switch-off/switch-on) for all components.

---

### 233813 <location>Encoder 3: Hardware logic unit failed

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1 bin

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** PULSE INHIBIT

**Cause:** The logic unit of the DRIVE-CLiQ encoder has failed.

Fault value (r0949, interpret binary):

Bit 0: ALU watchdog has responded.

Bit 1: ALU has detected a sign-of-life error.

**Remedy:** When the error reoccurs, replace the encoder.

---

### 233820 <location>Encoder 3 DRIVE-CLiQ: Telegram error

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder concerned.

Fault cause:

1 (= 01 hex):

Checksum error (CRC error).

2 (= 02 hex):

Telegram is shorter than specified in the length byte or in the receive list.

3 (= 03 hex):

Telegram is longer than specified in the length byte or in the receive list.

4 (= 04 hex):

The length of the receive telegram does not match the receive list.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the component in the telegram and in the receive list do not match.

7 (= 07 hex):

A SYNC telegram is expected - but the received telegram is not a SYNC telegram.

8 (= 08 hex):

No SYNC telegram is expected - but the received telegram is one.

9 (= 09 hex):

The error bit in the receive telegram is set.

16 (= 10 hex):

The receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

---

### 233835 <location>Encoder 3 DRIVE-CLiQ: Cyclic data transfer error

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)

Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder concerned. The nodes do not send and receive in synchronism.

Fault cause:

33 (= 21 hex):

The cyclic telegram has not been received.

34 (= 22 hex):

Timeout in the telegram receive list.

64 (= 40 hex):

Timeout in the telegram send list.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON.
- replace the component involved.

---

---

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the encoder involved.  
Fault cause:  
11 (= 0B hex):  
Synchronization error during alternating cyclic data transfer.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON (switch-off/switch-on).

---

**233850 <location>Encoder 3: Encoder evaluation internal software error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** POWER ON

**Cause:** An internal software error has occurred in the Sensor Module of encoder 3.  
Fault value (r0949, interpret decimal):  
1: Background time slice is blocked.  
2: Checksum over the code memory is not OK.  
10000: OEM memory of the EnDat encoder contains data that cannot be interpreted.  
11000 ... 11499: Descriptive data from EEPROM incorrect.  
11500 ... 11899: Calibration data from EEPROM incorrect.  
11900 ... 11999: Configuration data from EEPROM incorrect.  
12000 ... 12008: communication with analog/digital converter faulted.  
16000: DRIVE-CLiQ encoder initialization application error.  
16001: DRIVE-CLiQ encoder initialization ALU error.  
16002: DRIVE-CLiQ encoder HISI / SISI initialization error.  
16003: DRIVE-CLiQ encoder safety initialization error.  
16004: DRIVE-CLiQ encoder internal system error.

**Remedy:** - replace the Sensor Module.  
- if required, upgrade the firmware in the Sensor Module.  
- contact Technical Support.

---

**233851 <location>Encoder 3 DRIVE-CLiQ (CU): Sign-of-life missing**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Sensor Module (encoder 3) involved to the Control Unit.  
The DRIVE-CLiQ component did not set the sign-of-life to the Control Unit.  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:** - Upgrade the firmware of the component involved.  
- carry out a POWER ON (switch-off/switch-on) for the component involved.

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Cause:</b>         | <p>A DRIVE-CLiQ communication error has occurred from the Sensor Module (encoder 3) involved to the Control Unit.</p> <p>Fault cause:</p> <p>11 (= 0B hex):</p> <p>Synchronization error during alternating cyclic data transfer.</p> <p>Note regarding the message value:</p> <p>The individual information is coded as follows in the message value (r0949/r2124):</p> <p>0000yyxx hex: yy = component number, xx = error cause</p> |

**Remedy:** Carry out a POWER ON.

---

**233896 <location>Encoder 3 DRIVE-CLiQ (CU): Inconsistent component properties**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1

**Reaction:** Servo: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)  
Hla: OFF2 (NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** The properties of the DRIVE-CLiQ component (Sensor Module for encoder 3), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.

Fault value (r0949, interpret decimal):

Component number.

**Remedy:**

- carry out a POWER ON.
- when a component is replaced, the same component type and if possible the same firmware version should be used.
- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

---

**233899 <location>Encoder 3: Unknown fault**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** New message: %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
Hla: OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A fault occurred on the Sensor Module for encoder 3 that cannot be interpreted by the Control Unit firmware.

This can occur if the firmware on this component is more recent than the firmware on the Control Unit.

Fault value (r0949, interpret decimal):

Fault number.

Note:

If required, the significance of this new fault can be read about in a more recent description of the Control Unit.

**Remedy:**

- replace the firmware on the Sensor Module by an older firmware version (r0148).
- upgrade the firmware on the Control Unit (r0018).

---

**233902 <location>Encoder 3: SPI-BUS error occurred**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Error when operating the internal SPI bus.  
Alarm value (r2124, interpret hexadecimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- replace the Sensor Module.
- if required, upgrade the firmware in the Sensor Module.
- contact Technical Support.

---

**233903 <location>Encoder 3: I2C-BUS error occurred**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Cause:</b>         | An error was identified in the encoder parameterization.<br>It is possible that the parameterized encoder type does not match the connected encoder.<br>The parameter involved can be determined as follows:<br>- determine the parameter number using the fault value (r0949).<br>- determine the parameter index (p0187).<br>Fault value (r0949, interpret decimal):<br>yyyyxxx dec: yyyy = supplementary information, xxxx = parameter<br>xxxx = 421:<br>For an EnDat/SSI encoder, the absolute position in the protocol must be less than or equal to 30 bits.<br>yyyy = 0:<br>No additional information available.<br>yyyy = 1:<br>The component does not support HTL level (p0405.1 = 0) combined with track monitoring A/B <> -A/B (p0405.2 = 1).<br>yyyy = 2:<br>A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please start a new encoder identification.<br>yyyy = 3:<br>A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please select a listed encoder in p0400 with a code number < 10000.<br>yyyy = 4:<br>This component does not support SSI encoders (p0404.9 = 1) without track A/B.<br>yyyy = 5:<br>For SQW encoder, value in p4686 greater than in p0425.<br>yyyy = 6:<br>DRIVE-CLiQ encoder cannot be used with this firmware version.<br>yyyy = 7:<br>For an SQW encoder, the XIST1 correction (p0437.2) is only permitted for equidistant zero marks.<br>yyyy = 8:<br>The motor pole pair width is not supported by the linear scale being used.<br>yyyy = 9:<br>The length of the position in the EnDat protocol may be a maximum of 32 bits.<br>yyyy = 10:<br>The connected encoder is not supported.<br>yyyy = 11:<br>The hardware does not support track monitoring. |

- Remedy:**
- check whether the connected encoder type matches the encoder that has been parameterized.
  - correct the parameter specified by the fault value (r0949) and p0187.
  - re parameter number = 314:
  - check the pole pair number and measuring gear ratio. The quotient of the "pole pair number" divided by the "measuring gear ratio" must be less than or equal to 1000 ((r0313 \* p0433) / p0432 <= 1000).

---

**233912 <location>Encoder 3: Device combination is not permissible**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE)  
Hla: OFF1 (NONE)

**Acknowledge:** PULSE INHIBIT

**Cause:** The selected device combination is not supported.

Fault value (r0949, interpret decimal):

1003:

The connected measuring unit cannot be operated with the EnDat 2.2 converter. For instance, the measuring unit has a pulse number/resolution of  $2^n$ .

1005:

The type of measuring unit (incremental) is not supported by the EnDat 2.2 converter.

1006:

The maximum duration of the EnDat transfer (31.25  $\mu$ s) was exceeded.

2001:

The set combination of current controller cycle, DP cycle and Safety cycle is not supported by the EnDat 2.2 converter.

2002:

The resolution of the linear measuring unit does not match the pole pair width of the linear motor

Pole pair width, minimum =  $p0422 * 2^{20}$

**Remedy:** For fault value = 1003, 1005, 1006:

- Use a measuring unit that is permissible.

For fault value = 2001:

- set a permissible cycle combination (if required, use standard settings).

For fault value = 2002:

- Use a measuring unit with a lower resolution (p0422).

---

**233915 <location>Encoder 3: Encoder configuration error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The configuration for encoder 3 is incorrect.

Alarm value (r2124, interpret decimal):

1:

Re-parameterization between fault/alarm is not permissible.

2:

The cyclic DQ receive telegram is too long and is limited.

3:

The cyclic DQ send telegram is too long and is limited.

419:

When the fine resolution Gx\_XIST2 is configured, the encoder identifies a maximum possible absolute position actual value (r0483) that can no longer be represented within 32 bits.

**Remedy:** For alarm value = 1:  
No re-parameterization between fault/alarm.  
For alarm value = 419:  
Reduce the fine resolution (p0419) or deactivate the monitoring (p0437.25), if the complete multiturn range is not required.

---

### 233916 <location>Encoder 3: Encoder parameterization error

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** Parameter: %1, supplementary information: %2  
**Reaction:** Servo: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)  
 Hla: OFF1 (NONE, OFF2, OFF3, STOP2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** An encoder parameter was detected as being incorrect.  
 It is possible that the parameterized encoder type does not match the connected encoder.  
 The parameter involved can be determined as follows:  
 - determine the parameter number using the fault value (r0949).  
 - determine the parameter index (p0187).  
 Fault value (r0949, interpret decimal):  
 Parameter number.  
**Remedy:** - check whether the connected encoder type matches the encoder that has been parameterized.  
 - correct the parameter specified by the fault value (r0949) and p0187.

---

### 233920 <location>Encoder 3: Temperature sensor fault (motor)

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** Fault cause: %1, channel number: %2  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The motor detected a fault when evaluating the temperature sensor.  
 Fault cause:  
 1 (= 01 hex):  
 Wire breakage or sensor not connected.  
 KTY: R > 1630 Ohm, PT1000: R > 1720 Ohm  
 2 (= 02 hex):  
 Measured resistance too low.  
 PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm  
 Additional values:  
 Only for internal Siemens troubleshooting.  
 Note regarding the message value:  
 The individual information is coded as follows in the message value (r0949/r2124):  
 0000yyxx hex: yy = channel number, xx = error cause  
**Remedy:** - check that the encoder cable is the correct type and is correctly connected.  
 - check the temperature sensor selection in p0600 to p0603.  
 - replace the Sensor Module (hardware defect or incorrect calibration data).

---

### 233930 <location>Encoder 3: Data logger has saved data

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE

**Cause:** For the activated function "Data logger" (p0437.0 = 1) a fault has occurred with the Sensor Module. This alarm indicates that the diagnostics data corresponding to the fault was saved on the memory card.  
The diagnostics data is saved in the following folder:  
/USER/SINAMICS/DATA/SMTRC00.BIN  
...  
/USER/SINAMICS/DATA/SMTRC07.BIN  
/USER/SINAMICS/DATA/SMTRCIDX.TXT  
The following information is contained in the TXT file:  
- Display of the last written BIN file.  
- Number of write operations that are still possible (from 10000 downwards).  
**Note:**  
Only Siemens can evaluate the BIN files.

**Remedy:** Not necessary.  
This alarm is automatically withdrawn.  
The data logger is ready to record the next fault case.

---

**233940**      **<location>Encoder 3: Spindle sensor S1 voltage incorrect**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE

**Cause:** The voltage of analog sensor S1 is outside the permissible range.  
Alarm value (r2124, interpret decimal):  
Signal level from sensor S1.  
**Note:**  
A signal level of 500 mV corresponds to the numerical value 500 dec.

**Remedy:** - check the clamped tool.  
- check the tolerance and if required, adapt (p5040).  
- check the thresholds and if required, adapt (p5041).  
- check analog sensor S1 and connections.  
See also: p5040 (Spindle voltage threshold values tolerance), p5041 (Spindle voltage threshold values)

---

**233950**      **<location>Encoder 3: Internal software error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** OFF1 (OFF2)  
**Acknowledge:** POWER ON

**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret decimal):  
Information about the fault source.  
Only for internal Siemens troubleshooting.

**Remedy:** - if necessary, upgrade the firmware in the Sensor Module to a later version.  
- contact Technical Support.

---

**233999**      **<location>Encoder 3: Unknown alarm**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** New message: %1  
**Reaction:** NONE

**234801 <location>VSM DRIVE-CLiQ: Sign-of-life missing**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** Component number: %1, fault cause: %2  
**Reaction:** OFF2 (NONE, OFF1)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the Voltage Sensing Module (VSM).  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause  
**Remedy:**  
- check the DRIVE-CLiQ connection.  
- replace the Voltage Sensing Module (VSM).

---

**234802 <location>VSM: Time slice overflow**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** -  
**Reaction:** Infeed: OFF2 (NONE, OFF1)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A time slice overflow has occurred on the Voltage Sensing Module.  
**Remedy:** Replace the Voltage Sensing Module.

---

**234803 <location>VSM: Memory test**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** -  
**Reaction:** Infeed: OFF2 (NONE, OFF1)  
**Acknowledge:** IMMEDIATELY  
**Cause:** An error has occurred during the memory test on the Voltage Sensing Module.  
**Remedy:**  
- check whether the permissible ambient temperature for the Voltage Sensing Module is being maintained.  
- replace the Voltage Sensing Module.

---

**234804 <location>VSM: CRC**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** %1  
**Reaction:** Infeed: OFF2 (NONE, OFF1)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A checksum error has occurred when reading-out the program memory on the Voltage Sensing Module (VSM).  
**Remedy:**  
- check whether the permissible ambient temperature for the component is maintained.  
- replace the Voltage Sensing Module.

---

**234805 <location>VSM: EEPROM checksum error**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** %1  
**Reaction:** Infeed: OFF2 (NONE, OFF1)  
**Acknowledge:** IMMEDIATELY

**234820 <location>VSM DRIVE-CLiQ: Telegram error**

|                       |                                              |
|-----------------------|----------------------------------------------|
| <b>Drive object:</b>  | A_INF_828, B_INF_828, S_INF_828, S_INF_COMBI |
| <b>Message value:</b> | Component number: %1, fault cause: %2        |
| <b>Reaction:</b>      | Infeed: OFF2 (NONE, OFF1)                    |
| <b>Acknowledge:</b>   | IMMEDIATELY                                  |

**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the Voltage Sensing Module involved.

Fault cause:

1 (= 01 hex):

Checksum error (CRC error).

2 (= 02 hex):

Telegram is shorter than specified in the length byte or in the receive list.

3 (= 03 hex):

Telegram is longer than specified in the length byte or in the receive list.

4 (= 04 hex):

The length of the receive telegram does not match the receive list.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the component in the telegram and in the receive list do not match.

7 (= 07 hex):

A SYNC telegram is expected - but the received telegram is not a SYNC telegram.

8 (= 08 hex):

No SYNC telegram is expected - but the received telegram is one.

9 (= 09 hex):

The error bit in the receive telegram is set.

16 (= 10 hex):

The receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

---

### 234835 <location>VSM DRIVE-CLiQ: Cyclic data transfer error

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** Infeed: OFF2 (NONE, OFF1)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the Voltage Sensing Module involved. The nodes do not send and receive in synchronism.

Fault cause:

33 (= 21 hex):

The cyclic telegram has not been received.

34 (= 22 hex):

Timeout in the telegram receive list.

64 (= 40 hex):

Timeout in the telegram send list.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON.
- replace the component involved.

---

**234850 <location>VSM: Internal software error**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** %1  
**Reaction:** Infeed: OFF1 (NONE, OFF2)  
**Acknowledge:** POWER ON  
**Cause:** An internal software error in the Voltage Sensing Module (VSM) has occurred.  
Fault value (r0949, interpret decimal):  
1: Background time slice is blocked.  
2: Checksum over the code memory is not OK.  
**Remedy:** - replace the Voltage Sensing Module (VSM).  
- if required, upgrade the firmware in the Voltage Sensing Module.  
- contact Technical Support.

**234851 <location>VSM DRIVE-CLiQ (CU): Sign-of-life missing**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150  
**Message value:** Component number: %1, fault cause: %2  
**Reaction:** Infeed: OFF2 (NONE, OFF1)  
Servo: NONE (OFF1, OFF2)  
Hla: NONE (OFF1, OFF2)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A DRIVE-CLiQ communications error has occurred from the Voltage Sensing Module involved (VSM) to the Control Unit.  
The DRIVE-CLiQ component did not set the sign-of-life to the Control Unit.  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause  
**Remedy:** Upgrade the firmware of the component involved.

| <b>Drive object:</b>  | A_INF_828, B_INF_828, CU_LINK, HLA_828, S_INF_828, S_INF_COMBI, SERVO_828, SERVO_COMBI, TM120, TM150 |
| <b>Message value:</b> | Component number: %1, fault cause: %2                                                                |
| <b>Reaction:</b>      | <p>Infeed: OFF2 (NONE, OFF1)</p> <p>Servo: NONE (OFF1, OFF2)</p> <p>Hla: NONE (OFF1, OFF2)</p>       |
| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                          |

**Cause:** A DRIVE-CLiQ communications error has occurred from the Voltage Sensing Module involved (VSM) to the Control Unit.  
Fault cause:  
11 (= 0B hex):  
Synchronization error during alternating cyclic data transfer.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON.

---

**234896 <location>VSM DRIVE-CLiQ (CU): Inconsistent component properties**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150

**Message value:** Component number: %1

**Reaction:** Infeed: OFF2 (NONE, OFF1)  
Servo: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)  
Hla: OFF2 (NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** The properties of the DRIVE-CLiQ component (Voltage Sensing Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.  
Fault value (r0949, interpret decimal):  
Component number.

**Remedy:** - carry out a POWER ON.  
- when a component is replaced, the same component type and if possible the same firmware version should be used.  
- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

---

**234899 <location>VSM: Unknown fault**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** New message: %1

**Reaction:** Infeed: NONE (OFF1, OFF2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A fault occurred on the Voltage Sensing Module that cannot be interpreted by the Control Unit firmware.  
This can occur if the firmware on this component is more recent than the firmware on the Control Unit.  
Fault value (r0949, interpret decimal):  
Fault number.  
Note:  
If required, the significance of this new fault can be read about in a more recent description of the Control Unit.

**Remedy:** - replace the firmware on the Voltage Sensing Module by an older firmware version (r0158).  
- upgrade the firmware on the Control Unit (r0018).

---

**234903 <location>VSM: I2C bus error occurred**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An error has occurred when accessing the module-internal I2C bus.

**Remedy:** Replace the Voltage Sensing Module (VSM).

---

**234904 <location>VSM: EEPROM**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An error has occurred accessing the non-volatile memory on the Terminal Module.  
**Remedy:** Replace the Voltage Sensing Module (VSM).

#### 234905 <location>VSM: Parameter access

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The Control Unit attempted to write an illegal parameter value to the Voltage Sensing Module (VSM).  
**Remedy:** - check whether the firmware version of the VSM (r0158) matches the firmware version of Control Unit (r0018).  
 - if required, replace the Voltage Sensing Module.  
**Note:**  
 The firmware versions that match each other are in the readme.txt file on the memory card.

#### 234920 <location>VSM: overtemperature or temperature sensor fault

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** %1  
**Reaction:** NONE (OFF1, OFF2)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** When evaluating the temperature sensor, a resistance value outside the permissible range was detected.  
 Fault value (r0949, interpret decimal):  
 1: overtemperature, wire breakage or sensor not connected.  
 KTY: R > 1630 Ohm, PT1000: R > 1720 Ohm  
 2: Measured resistance too low.  
 PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 723 Ohm  
**Remedy:** - make sure that the sensor is connected correctly.  
 - replace the sensor.  
 - allow to cool down and then check the ambient conditions, load cycle and cooling (fan fuse).  
 - check the temperature sensor type setting (p3665).  
 - infeed: check the line filter type setting (p0220).

#### 234950 <location>VSM: Internal software error

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An internal software error in the Voltage Sensing Module (VSM) has occurred.  
 Fault value (r0949, interpret decimal):  
 Information about the fault source.  
 Only for internal Siemens troubleshooting.  
**Remedy:** - if necessary, upgrade the firmware in the Voltage Sensing Module to a later version.  
 - contact Technical Support.

#### 234999 <location>VSM: Unknown alarm

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** New message: %1

| <b>Cause:</b>         | <p>The functionality of Safety Basic Functions via TM54F is used.</p> <p>TM54F has been incorrectly parameterized (incorrect parameter assignment).</p> <p>Only the following signals may be parameterized:</p> <ul style="list-style-type: none"><li>- STO active</li><li>- SS1 active</li><li>- internal event</li><li>- safe state</li></ul> <p>Possible causes:</p> <ul style="list-style-type: none"><li>- p10024 ... p10038 not set to 0 or 255.</li><li>- p10039, p10042 ... p10045 use signals from Safety Extended Functions.</li></ul> <p>Fault value (r0949, interpret binary):</p> <p>Bits 0 ... 3 specifies for which drive group an illegal F-DI was parameterized:</p> <ul style="list-style-type: none"><li>Bit 0 = 1: drive group 1 error</li><li>Bit 1 = 1: drive group 2 error</li><li>Bit 2 = 1: drive group 3 error</li><li>Bit 3 = 1: drive group 4 error</li></ul> <p>Bits 4 ... 7 specifies for which F-DOs incorrect links were specified:</p> <ul style="list-style-type: none"><li>Bit 4 = 1: F-DO 0 error (p10042)</li><li>Bit 5 = 1: F-DO 1 error (p10043)</li><li>Bit 6 = 1: F-DO 2 error (p10044)</li><li>Bit 7 = 1: F-DO 3 error (p10045)</li></ul> |

**Remedy:**

- check the setting of the failsafe digital inputs (F-DI) for the Safety Extended Functions - and set to a value of 0 or 255 (p10024 ... p10039).
- check the setting of the signal sources for the failsafe digital outputs (F-DO) and if necessary, correct (p10042 ... p10045).

Note:

F-DI: Failsafe Digital Input  
F-DO: Failsafe Digital Output

### 235002 <location>TM54F: Commissioning not possible

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The commissioning mode activation was rejected because at least one drive belonging to the TM54F is enabled for operation.  
Fault value (r0949, interpret decimal):  
Drive object number of the first drive found without pulse suppression/power inhibit.

**Remedy:** Withdraw the operating enable for the drive specified in the fault value.

---

### 235003 <location>TM54F: Acknowledgment on the Control Unit is required

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A fault on the Terminal Module 54F (TM54) was acknowledged using the safe acknowledgment (p10006).  
An additional acknowledgment is also required at the Control Unit.

**Remedy:** - acknowledge all faults on the Control Unit (BI: p2102).  
or  
- acknowledge all faults on the drive object TM54F (BI: p2103, p2104 or p2105).

Note:  
A fault acknowledgment is triggered with a 0/1 signal.

---

### 235004 <location>TM54F: communication cycle invalid

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** Fault cause: %1 bin

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

| <b>Reaction:</b>      | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Acknowledge:** NONE

**Cause:** The forced checking procedure (test stop) for the failsafe digital inputs/outputs (F-DI/F-DO) is currently in progress.

**Remedy:** The alarm is automatically withdraw after successfully ending or canceling (when a fault condition occurs) the test stop.

Note:

F-DI: Failsafe Digital Input

F-DO: Failsafe Digital Output

---

**235013**      **<location>TM54F: Test stop error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A fault has been detected during the forced checking procedure (test stop) of the failsafe digital inputs/outputs on the TM54F. Failsafe control signals (Failsafe Values) are transferred to the safety functions.

Fault value (r0949, interpret hexadecimal):

aaaabbcc hex:

aaaa: DO or F-DI (dependent on test step cc), where the expected state was not assumed (bit 0 = F-DI 0 or F-DO 0, bit 1 = F-DI 1 or F-DO 1, etc.).

bb: Fault cause

bb = 01 hex: Internal fault.

bb = 02 hex: Fault when comparing the switching signals of the two channels (F-DI or DI).

bb = 03 hex: Internal fault.

bb = 04 hex: Fault when comparing the switching signals of the two channels (Diag-DO).

cc: State of the test stop in which the fault has occurred.

The display format is as follows:

Slave fault state: (test actions)(test actions) | corresponding step for the master: (test actions)(test actions) | Description

00 hex: (L1+OFF)(L2+ON) | 0A hex: ( ) ( ) | Synchronization / switching step

0A hex: (L1+OFF)(L2+ON) | 15 hex: ( ) ( ) | Wait step

15 hex: (L1+OFF)(L2+OFF) | 20 hex: ( ) ( ) | 1.) F-DI 0 ... 4 check for 0 V 2.) Switch step to new level

20 hex: (L1+OFF)(L2+OFF) | 2B hex: ( ) ( ) | Wait step

2B hex: (L1+ON)(L2+ON) | 36 hex: ( ) ( ) | 1.) F-DI 5 ... 9 check for 0 V 2.) Switch step to new level

36 hex: (DO OFF)( ) | 41 hex: (DO OFF)( ) | Wait step / switching step

41 hex: (DO OFF)( ) | 4C hex: (DO OFF)( ) | Wait step

4C hex: (DO ON)( ) | 57 hex: (DO ON)( ) | 1.) Check diag-DO or diag-DI 2.) Switch step to new level

57 hex: (DO ON)( ) | 62 hex: (DO ON)( ) | Wait step

62 hex: (DO OFF)( ) | 6D hex: (DO ON)( ) | 1.) Check diag-DO or diag-DI 2.) Switch step

6D hex: (DO OFF)( ) | 78 hex: (DO ON)( ) | Wait step

78 hex: (DO ON)( ) | 83 hex: (DO OFF)( ) | 1.) Check diag-DO or diag-DI 2.) Switch step

83 hex: (DO ON)( ) | 8E hex: (DO OFF)( ) | Wait step

8E hex: (DO OFF)( ) | 99 hex: (DO OFF)( ) | 1.) Check diag-DO or diag-DI 2.) Switch step

99 hex: (DO OFF)( ) | A4 hex: (DO OFF)( ) | Wait step

A4 hex: (DO OFF)( ) | AF hex: (DO OFF)( ) | Check Diag-DO or Diag-DI

AF hex: (DO original state)( ) | C5 hex: (DO original state)( ) | Switching step

C5 hex: End of test

The expected states to be checked depend on the parameterized test mode (p10047).

The following expected states are tested in the test steps when testing the F-DOs:

The display format is as follows:

Test step (SL MA): Expected Diag-DO mode 1 | Expected DI 20 ... 23 mode 2 | Expected DI 20 ... 23 mode 3

(4C hex 57 hex): Diag-DO = 0 V | DI = 24 V | DI = 24 V

(62 hex 6D hex): Diag-DO = 0 V | DI = 0 V | DI = 0 V

(78 hex 83 hex): Diag-DO = 0 V | DI = 0 V | DI = 24 V

(8E hex 99 hex): Diag-DO = 24 V | DI = 0 V | DI = 24 V

(A4 hex AF hex): Diag-DO = 0 V | DI = 24 V | DI = 24 V

Example:

If an error with fault causes bb = 02 hex or 04 hex occurs in a test stop step, the test action for the fault took place in the previous test stop step. The expected states are tested in the next step.

Master signals fault value 0001\_04AF and slave signals fault value 0001\_04A4.

aaaa = 1 --> F-DO 0 is involved.

bb = 04 hex --> the test of the Diag-DO was unsuccessful.

cc = The expected states were tested in test stop step AF on the master and A4 on the slave.

The expected state Diag-DO = 0 V was checked in the table, i.e. Diag-DO was at 0 V instead of the expected 24 V. The associated test action took place in the previous step (99 hex DO OFF, A4 hex DO OFF). Both DOs were switched to OFF.

**Remedy:** Check the wiring of the F-DIs and F-DOs and restart the test stop.

**Note:**

The fault is withdrawn if the test stop is successfully completed.

For fault value = CCCCCCCC hex, DDDDDDDD hex, EEEEEEEE hex the following applies:

These fault values occur together with fault F35152.

Possible countermeasure:

- check all parameters for the test stop.

- you should also check whether the firmware version of the TM54F matches that of the Control Unit.

- check p10001, p10017, p10046 and p10047.

A POWER ON must be carried out after correcting the parameters.

F-DI: Failsafe Digital Input

F-DO: Failsafe Digital Output

**235014 <location>TM54F: Test stop for failsafe digital inputs/outputs**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The time set in p10003 for the forced checking procedure (test stop) for the digital inputs/outputs has been exceeded. A new forced checking procedure is required.

After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset.

**Note:**

- this message does not result in a safety stop response.

- the test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

See also:p10003

**Remedy:** Carry out the forced checking procedure for the digital inputs/outputs.

The signal source to select the forced checking procedure is set via binector input p10007.

**Cause:** The Terminal Module 54F (TM54F) has identified an error in the data cross check between the two control channels. This can be the result of incorrect parameterization. However, a fault may have occurred, which was identified by the Safety Integrated software (e.g. defective hardware).  
 Perform the steps listed under "Remedy" in order to rule out any defective hardware.  
 As fault response failsafe input terminal signals are transferred to the motion monitoring functions.  
 Fault value (r0949, interpret hexadecimal):  
 aaaabbcc hex  
 aaaa: A value greater than zero indicates an internal software error.  
 bb: Data to be cross-compared that resulted in the error.  
 If specified, check the specified parameters to ensure that they are the same for both the TM54F master and TM54F slave.  
 bb = 00 hex: p10000[0]  
 bb = 01 hex: p10001  
 bb = 02 hex: p10002  
 bb = 03 hex: p10006

bb = D2 ... D3 error in the data for drive group 3 SLP parameter p10032 ... p10033  
bb = D4 ... D5 error in the data for drive group 4 SLP parameter p10032 ... p10033  
bb = D6 error in the data for initializing the retract function  
bb = D7 error in the data for the retract function SLP  
bb = D8 error in parameter p10000[1...5]  
bb = D9 ... E3 error in the internal data of the axis communication  
bb = E4 ... F2 error in the internal data of the discrepancy check  
cc: indicates the index of the data to be cross-compared that resulted in the error.

**Remedy:**

Carry out the following steps on the TM54F:

- check the specified parameters for incorrect parameterization.
- activate the safety commissioning mode (p0010 = 95).
- start the copy function for SI parameters (p9700 = 57 hex).
- acknowledge complete data change (p9701 = AC hex).
- exit the safety commissioning mode (p0010 = 0).
- save all parameters (p0977 = 1).
- carry out safe acknowledgment (p10006).

For an internal software error (aaaa > 0):

- For TM54F, upgrade the firmware to a later version.
- contact Technical Support.
- replace the TM54F.

---

**235052 <location>TM54F: Internal hardware error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** An internal software/hardware error has been detected on the Terminal Module 54F (TM54F).

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- check the electrical cabinet design and cable routing for EMC compliance
- upgrade TM54F firmware to more recent version.
- contact Technical Support.
- replace the TM54F.

---

**235053 <location>TM54F: Temperature fault threshold exceeded**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature measured using the temperature sensing on the TM54F has exceeded the threshold value to initiate this fault.

As fault response failsafe input terminal signals are transferred to the motion monitoring functions.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- allow the TM54F to cool down.
- carry out safe acknowledgment (p10006).

---

### 235054 <location>TM54F: Temperature alarm threshold exceeded

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The temperature measured using the temperature sensing on the TM54F has exceeded the threshold value to initiate this alarm.

**Remedy:**

- allow the TM54F to cool down.
- carry out safe acknowledgment (p10006).

---

### 235075 <location>TM54F: Error during internal communication

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An internal communications error has occurred in the Terminal Module 54F (TM54F).

This message is also output in the following cases:

- parameter p10000 (TM54F master) is not set the same as p10000 (TM54F slave).
- parameter p10010 (TM54F master) is not set the same as p10010 (TM54F slave).

Alarm value (r2124, interpret decimal):

Only for internal Siemens diagnostics.

**Remedy:** For p10010/p10000 from the TM54F master not equal to the TM54F slave:

- start the copy function for the node identifier on the TM54F (p9700 = 1D hex).
- acknowledge the hardware CRC on the TM54F (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

For internal communication errors:

- check the electrical cabinet design and cable routing for EMC compliance
- upgrade the software on the TM54F.
- contact Technical Support.
- replace the TM54F.

---

### 235080 <location>TM54F: Checksum error safety parameters

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The calculated checksum entered in r10004 over the safety-relevant parameters does not match the reference checksum saved in p10005 at the last machine acceptance.

Fault value (r0949, interpret binary):

Bit 0 = 1: Checksum error for functional SI parameters.

Bit 1 = 1: Checksum error for SI parameters for component assignment.

**Remedy:**

- check the safety-relevant parameters and if required, correct.

- set the reference checksum to the actual checksum.

- acknowledge the hardware replacement.

- carry out a POWER ON (switch-off/switch-on).

- carry out an acceptance test.

| <b>Cause:</b>  | <p>The safe input terminals or output terminals have a different state for longer than the time parameterized in p10002 - or too many switching operations were carried out within a monitoring cycle p10002.</p> <p>Fault value (r0949, interpret hexadecimal):</p> <p>yyyyxxxx hex</p> <p>xxxx: The safety-relevant input terminals F-DI indicate a discrepancy.</p> <p>Bit 0: Discrepancy for F-DI 0</p> <p>...</p> <p>Bit 9: Discrepancy for F-DI 9</p> <p>yyyy: The safety-relevant output terminals F-DO indicate a discrepancy.</p> <p>Bit 0: Discrepancy for F-DO 0</p> <p>...</p> <p>Bit 3: Discrepancy for F-DO 3</p> <p>Note:</p> <p>If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs.</p> <p>The following options are available to analyze all of the discrepancy errors:</p> <ul style="list-style-type: none"> <li>- using the commissioning tool, evaluate the input states and output states of the TM54F. All discrepancy errors are displayed here.</li> <li>- compare parameters p10051 and p10052 from the TM54F master and TM54F slave for discrepancy.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Remedy:</b> | <p>Check the wiring of the corresponding F-DI (contact problems).</p> <p>If the wiring is correct, and for example there is no wire breakage, then a check must be made as to whether the switching frequency at F-DI is too high and must therefore be reduced (switching pulses must have a longer time between them).</p> <p>The time interval between each signal edge at an F-DI must be at least equal to the discrepancy time before the input is switched again.</p> <p>Discrepancy errors in the failsafe digital inputs (F-DI) can only be completely acknowledged if, after the cause of the error was resolved, safe acknowledgment was carried out (see p10006). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally.</p> <p>Sets the discrepancy time for fast switching operations at the F-DIs:</p> <p>For fast switching operations at the failsafe digital inputs (F-DI), it may be necessary to adapt the discrepancy time to the switching frequency:</p> <ul style="list-style-type: none"> <li>- the period of a cyclic switching pulse must be less than half of the discrepancy time (if necessary, round down).</li> <li>- the time between two switching pulses should be longer than the discrepancy time (if necessary, round up).</li> <li>- the discrepancy time must be at least r10003 (it must always be rounded-down or rounded-up to an integer multiple of the SI sampling time r10003). If a debounce time has been parameterized (p10017 &gt; 0), then the shortest possible discrepancy time is directly specified using the debounce time.</li> <li>- the period of a cyclic switching pulse must be less than half of the discrepancy time p10017 (if necessary, round down).</li> <li>- the time between two fast switching pulses should be longer than the discrepancy time+p10017 (if necessary, round up).</li> <li>- the discrepancy time must be at least r10003.</li> </ul> <p>The debounce time must always be set less than the discrepancy time.</p> <p>Example:</p> <p>If the SI sampling cycle is 12 ms and the switching frequency is 110 ms (p10017 = 0), the maximum discrepancy time which can be set is as follows:</p> $p10002 \leq 110/2 \text{ ms} - 12 \text{ ms} = 43 \text{ ms} \rightarrow \text{rounded-off, the following is obtained } p10002 \leq 36 \text{ ms}$ <p>Since the discrepancy time can only be accepted as a whole SI sampling time, the value will need to be rounded up or down to a whole SI sampling time value if it is not an exact integer multiple of an SI sampling time.</p> <p>Basic secondary condition to set the discrepancy time:</p> <p>The discrepancy time of the F-DIs must always be longer than the longest SI sampling time of all drives that use Safety Integrated with TM54F (p9780/p9500).</p> <p>F-DI: Failsafe Digital Input</p> <p>F-DO: Failsafe Digital Output</p> |

**Acknowledge:** IMMEDIATELY

**Cause:** An internal software error has occurred in the Terminal Module 54F (TM54F).  
The failsafe digital inputs and digital outputs (F-DI, F-DO) on the TM54F have been set to the safe state.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

Note:

F-DI: Failsafe Digital Input

F-DO: Failsafe Digital Output

**Remedy:** Check that the firmware version of the TM54F matches the Control Unit's firmware version.

The automatic firmware update must be activated in the project.

Note:

This signal will also appear, for example, in conjunction with fault F35013. In this case, check all the parameters for the test stop on the TM54F (p10001, p10003, p10007, p10041, p10046, p10047). In this case, a POWER ON is required after the parameters have been corrected.

**235200**      **<location>TM: Calibration data**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An error was detected in the calibration data of the Terminal Module.

Alarm value (r2124, interpret decimal):

ddcbaa dec: dd = component number, c = AI/AO, b = fault type, aa = number

c = 0: analog input (AI)

c = 1: analog output (AO)

b = 0: No calibration data available.

b = 1: Offset too high (> 100 mV).

**Remedy:** - carry out a POWER ON (switch-off/switch-on) for all components.

- replace the component if necessary.

**235220 <location>TM: Frequency limit reached for signal output**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** Infeed: OFF1 (NONE, OFF2)  
Servo: OFF1 (NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The signals output from the Terminal Module 41 (TM41) for tracks A/B have reached the limit frequency. The output signals are no longer in synchronism with the specified setpoint.

SIMOTION (p4400 = 0) operating mode:

- if the TM41 has been configured as the technology project, this fault is also output in response to short-circuited A/B signals in X520.

SINAMICS (p4400 = 1) operating mode:

- the fine resolution of TM41 in p0418 does not match that of the connector input that was interconnected at p4420
- the encoder position actual value r0479 interconnected at connector input p4420 has an excessively high actual speed
- the output signals correspond to a speed, which is greater than the maximum speed (r1082 of TM41).

**Remedy:** SIMOTION (p4400 = 0) operating mode:

- enter a lower speed setpoint (p1155).
- reduce the encoder pulse number (p0408).
- check track A/B for short-circuits.

SINAMICS (p4400 = 1) operating mode:

- enter a lower speed setpoint (p1155).
- reduce the encoder pulse number (p0408).

Notice:

The output signal is no longer monitored after changing the message type to "Alarm" (A).

---

**235221 <location>TM: Setpoint - actual value deviation outside the tolerance range**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** Infeed: OFF1 (NONE, OFF2)  
Servo: OFF1 (NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The deviation between the setpoint and the output signals (track A/B) exceeds the tolerance of +/-3 %. The deviation between the internal and external measured value is too high (> 1000 pulses).

**Remedy:** - reduce the basic clock cycle (p0110, p0111).  
- if required, replace the component (e.g. internal short-circuit).

---

| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Cause:</b>         | The zero mark synchronization with the encoder to be emulated was interrupted.<br>Alarm value (r2124, interpret decimal):<br>0: The encoder is not in the ready state (e.g. encoder parked)<br>1: An absolute encoder was connected.<br>2: The encoder r0479[0...2] interconnected via connector input: p4420 is already communicating with another TM41 (precisely one TM41 can be interconnected with a specific r0479[0...2]).<br>3: The BICO interconnection to Terminal Module 41 (TM41) was removed (CI: p4420 = 0 signal).<br>4: The encoder interconnected via connector input: p4420 has carried out an EDS changeover or has been re-parameterized (this operation is not supported, set p4420 to 0 and interconnect again).<br>5: The maximum number of revolutions of the encoder was exceeded.<br>6: Encoder in an invalid state.<br>7: Encoder in an invalid state.<br>8: Encoder in an invalid state (the encoder is not parameterized or the interconnected signal source is not in the cyclic state). |

**Remedy:** Not necessary.

- if the encoder changes into the ready state, then a synchronization operation that was previously interrupted is carried out again.
- if the synchronization was interrupted due to the maximum permissible synchronization duration, then a new synchronization is not carried out.
- the alarm is only output, if, for an absolute encoder, the zero mark synchronization is set to the zero position (p4401.0 = 1 and p4401.1=0).

---

**235225 <location>TM: Zero mark synchronization held - encoder not in the ready state**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The zero mark synchronization with the encoder to be emulated was held.  
The encoder is not in the "ready" state.

**Remedy:** Bring the encoder into the "ready" state.

---

**235226 <location>TM: Tracks A/B are deactivated**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** There is no frequency setpoint for the Terminal Module 41 (TM41). The output of tracks A/B has been held (frozen).  
Possible causes:

- connector input p4420 is not interconnected.
- the leading encoder is not in the "ready" state (parking encoder or encoder data set not parameterized).
- TM41 has a fault.
- the TM41 is in the commissioning mode (p0010 > 0).
- the TM41 component is not connected to DRIVE-CLiQ.

**Remedy:** - appropriately interconnect connector input p4420.  
- bring the leading encoder into the "ready" state.  
- remove any TM41 faults.

---

**235227 <location>EDS changeover/encoder data set change not supported**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Terminal Module 41 (TM41) does not support the following application cases:

- the encoder interconnected via connector input p4420 has carried out an EDS changeover.
- the encoder interconnected with the TM41 was re-parameterized so that the position actual value of the encoder must be newly interpreted.

For example, this is the case when changing the direction of rotation of the motor (p0410, p1821) or when changing the fine resolution (p0418). This may result in a sudden change in the position actual value of the encoder (position setpoint of the TM41), which must not be output at the TM41.

**Remedy:** Set connector input p4420 = 0 and re-wire.

---

**235228 <location>TM: Sampling time p4099[3] invalid**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

| <b>Acknowledge:</b>   | POWER ON                                                                                                                                                           |
| <b>Cause:</b>         | <p>The Terminal Module (TM) used has signaled internal errors.<br/>Signals from this module may not be evaluated because they are very likely to be incorrect.</p> |
| <b>Remedy:</b>        | If required, replace the Terminal Module.                                                                                                                          |

---

**235231 <location>TM: Master control by PLC missing****Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** -**Reaction:** NONE**Acknowledge:** NONE

**Cause:** The "master control by PLC" signal was missing in operation.

- interconnection of the binector input for "master control by PLC" is incorrect (p0854).
- the higher-level control has withdrawn the "master control by PLC" signal.
- data transfer via the fieldbus (master/drive) was interrupted.

**Note:**

This alarm is only decisive in the "SIMOTION" operating mode (p4400 = 0).

In the "SINAMICS" operating mode (p4400 = 1), the setpoints at p4420 are evaluated independent of binector input p0854.

**Remedy:**

- check the interconnection of the binector input for "master control by PLC" (p0854).
- check the "master control by PLC" signal and, if required, switch in.
- check the data transfer via the fieldbus (master/drive).
- check the setting of parameter p2037.

---

**235232 <location>TM41: Zero mark no longer synchronous POWER ON required****Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** -**Reaction:** NONE**Acknowledge:** NONE

**Cause:** SINAMICS (p4400 = 1) operating mode:

When parameterizing a Terminal Module 41 (TM41) or when operating a TM41 Module, an operating state was reached which required a POWER ON.

These include:

- changing the encoder pulse number (p0408).
- changing the fine resolution (p0418).
- withdrawing the DRIVE-CLiQ cable without first deactivating TM41 via p0105.

If this alarm was output, then the zero mark of the TM41 can no longer be output in synchronism to that of the encoder interconnected at p4420.

SIMOTION (p4400 = 0) operating mode:

A previously set zero mark position (p4426) no longer matches encoder position (r0479) due to the change in the pulse number (p0408).

**Remedy:** The incremental position at output X520 of TM41 can still be evaluated independent of the zero mark.  
A POWER ON must be carried out if the TM41 zero mark is evaluated.

---

**235233 <location>DRIVE-CLiQ component function not supported****Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY

**Cause:** A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.

Fault value (r0949, interpret decimal):

- 1: Terminal Module 31 does not support the function "Timer for temperature evaluation" (X522.7/8, p4103 > 0.000).
- 4: The improved actual value resolution is not supported (p4401.4).
- 5: The improved setpoint resolution is not supported (p4401.5).
- 6: The residual value handling in the setpoint channel cannot be deactivated (p4401.6).
- 7: Output frequencies greater than 750 kHz cannot be activated (p4401.7).

**Remedy:** For fault value = 1:  
 - Deactivate timer for temperature evaluation (X522.7/8) (p4103 = 0.000).  
 - use Terminal Module 31 and the relevant firmware version to enable the "Timer for temperature evaluation" function (Article No. 6SL3055-0AA00-3AA1, firmware version 2.6 and higher).

#### 235400 <location>TM: Temperature fault/alarm threshold channel 4 exceeded

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM150

**Message value:** %1

**Reaction:** Infeed: OFF2 (NONE, OFF1)  
 Servo: OFF2 (NONE, OFF1, OFF3)  
 Hla: OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** For the temperature evaluation via the Terminal Module 150 (TM150), at least one of the following conditions to initiate this fault is fulfilled:

- alarm threshold has been exceeded longer than that set in the timer (p4102[8], p4103[4]).
- or
- fault threshold exceeded (p4102[9]).

**Note:**

For sensor type "PTC thermistor" and "Bimetallic NC contact" (p4100[4] = 1, 4), the following applies:

- if r4101[4] > 1650 ohms, the temperature r4105[4] = 250 °C
- if r4101[4] ≤ 1650 ohms, the temperature r4105[4] = -50 °C

The temperature actual value is displayed via connector output r4105[4] and can be interconnected.

**Notice:**

This fault only causes the drive to shut down if there is at least one BICO interconnection between the drive and the Terminal Module.

Fault value (r0949, interpret decimal):

Temperature actual value at the time of initiation [0.1 °C].

**Remedy:** - allow the temperature sensor to cool down to below p4102[9] - hysteresis (p4118[4]).  
 - if required, set the fault response to NONE (p2100, p2101).

**235801 <location>TM DRIVE-CLiQ: Sign-of-life missing**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** Component number: %1, fault cause: %2

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred between the Control Unit and the Terminal Module involved.  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:** - check the DRIVE-CLiQ connection.  
- replace the component involved.

---

**235802 <location>TM: Time slice overflow**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A time slice overflow has occurred on the Terminal Module.

**Remedy:** Replace the Terminal Module.

---

**235803 <location>TM: Memory test**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An error has occurred during the memory test on the Terminal Module.

**Remedy:** - check whether the permissible ambient temperature for the Terminal Module is being maintained.  
- replace the Terminal Module.

---

**235804 <location>TM: CRC**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A checksum error has occurred when reading-out the program memory on the Terminal Module.  
Fault value (r0949, interpret hexadecimal):  
Difference between the checksum at POWER ON and the actual checksum.

---

**Remedy:**

- check whether the permissible ambient temperature for the component is maintained.
- replace the Terminal Module.

---

#### **235805      <location>TM: EEPROM checksum error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** Internal parameter data is corrupted.  
Alarm value (r2124, interpret hexadecimal):  
01: EEPROM access error.  
02: Too many blocks in the EEPROM.

**Remedy:**

- check whether the permissible ambient temperature for the component is maintained.
- replace the Terminal Module 31 (TM31).

---

#### **235807      <location>TM: Sequence control time monitoring**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Error, timeout, sequence control on the Terminal Module.

**Remedy:** Replace the Terminal Module.

---

#### **235820      <location>TM DRIVE-CLiQ: Telegram error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** Component number: %1, fault cause: %2

**Reaction:** OFF1 (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the Terminal Module involved.

Fault cause:

1 (= 01 hex):

Checksum error (CRC error).

2 (= 02 hex):

Telegram is shorter than specified in the length byte or in the receive list.

3 (= 03 hex):

Telegram is longer than specified in the length byte or in the receive list.

4 (= 04 hex):

The length of the receive telegram does not match the receive list.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the component in the telegram and in the receive list do not match.

7 (= 07 hex):

A SYNC telegram is expected - but the received telegram is not a SYNC telegram.

8 (= 08 hex):

No SYNC telegram is expected - but the received telegram is one.

9 (= 09 hex):

The error bit in the receive telegram is set.

16 (= 10 hex):

The receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).

- check the electrical cabinet design and cable routing for EMC compliance

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

---

## 235835 <location>TM DRIVE-CLiQ: Cyclic data transfer error

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** Component number: %1, fault cause: %2

**Reaction:** OFF1 (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the Terminal Module involved. The nodes do not send and receive in synchronism.

Fault cause:

33 (= 21 hex):

The cyclic telegram has not been received.

34 (= 22 hex):

Timeout in the telegram receive list.

64 (= 40 hex):

Timeout in the telegram send list.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON.

- replace the component involved.

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Cause:</b>         | <p>A DRIVE-CLiQ communication error has occurred from the Terminal Module involved (TM) to the Control Unit.</p> <p>Fault cause:</p> <p>11 (= 0B hex):</p> <p>Synchronization error during alternating cyclic data transfer.</p> <p>Note regarding the message value:</p> <p>The individual information is coded as follows in the message value (r0949/r2124):</p> <p>0000yyxx hex: yy = component number, xx = error cause</p> |

**Remedy:** Carry out a POWER ON.

---

**235896 <location>TM DRIVE-CLiQ (CU): Inconsistent component properties**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** Component number: %1

**Reaction:** Infeed: OFF2 (NONE, OFF1)  
Servo: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)  
Hla: OFF2 (NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** The properties of the DRIVE-CLiQ component (Terminal Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ component has been replaced.

Fault value (r0949, interpret decimal):

Component number.

**Remedy:** - carry out a POWER ON.

- when a component is replaced, the same component type and if possible the same firmware version should be used.

- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

---

**235899 <location>TM: Unknown fault**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** New message: %1

**Reaction:** Infeed: NONE (OFF1, OFF2)  
Servo: NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP2)  
Hla: NONE (OFF1, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A fault has occurred on the Terminal Module that cannot be interpreted by the Control Unit firmware. This can occur if the firmware on this component is more recent than the firmware on the Control Unit.

Fault value (r0949, interpret decimal):

Fault number.

Note:

If required, the significance of this new fault can be read about in a more recent description of the Control Unit.

**Remedy:** - replace the firmware on the Terminal Module by an older firmware version (r0158).

- upgrade the firmware on the Control Unit (r0018).

---

**235903 <location>TM: I2C bus error occurred**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An error has occurred while accessing the internal I2C bus of the Terminal Module.

**Remedy:** Replace the Terminal Module.

---

**235904 <location>TM: EEPROM**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An error has occurred accessing the non-volatile memory on the Terminal Module.

**Remedy:** Replace the Terminal Module.

---

#### 235905 <location>TM: Parameter access

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The Control Unit attempted to write an illegal parameter value to the Terminal Module.

**Remedy:** - check whether the firmware version of the Terminal Module (r0158) matches the firmware version of Control Unit (r0018).  
- if required, replace the Terminal Module.

**Note:**

The firmware versions that match each other are in the readme.txt file on the memory card.

---

#### 235906 <location>TM: 24 V power supply missing

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The 24 V power supply for the digital outputs is missing.

Alarm value (r2124, interpret hexadecimal):

01: TM17 24 V power supply for DI/DO 0 ... 7 missing.

02: TM17 24 V power supply for DI/DO 8 ... 15 missing.

04: TM15 24 V power supply for DI/DO 0 ... 7 (X520) missing.

08: TM15 24 V power supply for DI/DO 8 ... 15 (X521) missing.

10: TM15 24 V power supply for DI/DO 16 ... 23 (X522) missing.

20: TM41 24 V power supply for DI/DO 0 ... 3 missing.

**Remedy:** Check the terminals for the power supply voltage (L1+, L2+, L3+, M or +24 V\_1 for TM41).

---

#### 235907 <location>TM: Hardware initialization error

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The Terminal Module was not successfully initialized.

Alarm value (r2124, interpret hexadecimal):

01: TM17 or TM41 - incorrect configuration request.

02: TM17 or TM41 - programming not successful.

04: TM17 or TM41 - invalid time stamp

**Remedy:** Carry out a POWER ON.

---

#### 235910 <location>TM: Module overtemperature

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The temperature in the module has exceeded the highest permissible limit.

**Remedy:** - reduce the ambient temperature.

- replace the Terminal Module.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**235999 <location>TM: Unknown alarm**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** New message: %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An alarm has occurred on the Terminal Module that cannot be interpreted by the Control Unit firmware. This can occur if the firmware on this component is more recent than the firmware on the Control Unit.  
Alarm value (r2124, interpret decimal):  
Alarm number.

**Note:**

If required, the significance of this new alarm can be read about in a more recent description of the Control Unit.

**Remedy:** - replace the firmware on the Terminal Module by an older firmware version (r0158).  
- upgrade the firmware on the Control Unit (r0018).

---

**236207 <location>Hub: Overtemperature component**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE (OFF1, OFF2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The temperature on the DRIVE-CLiQ Hub Module has exceeded the fault threshold.  
Fault value (r0949, interpret decimal):  
Actual temperature in 0.1 °C resolution.

**Remedy:** - check ambient temperature at component installation location.  
- replace the component involved.

---

**236211 <location>Hub: Overtemperature alarm component**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The temperature on the DRIVE-CLiQ Hub Module has exceeded the alarm threshold.  
Alarm value (r2124, interpret decimal):  
Actual temperature in 0.1 °C resolution.

**Remedy:** - check ambient temperature at component installation location.  
- replace the component involved.

---

**236214 <location>Hub: overvoltage fault 24 V supply**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE (OFF1, OFF2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The 24 V power supply on the DRIVE-CLiQ Hub Module has exceeded the fault threshold.  
Fault value (r0949, interpret decimal):  
Actual operating voltage in 0.1 °C resolution

**Remedy:** - check the supply voltage of the component involved.  
- replace the component involved.

---

---

**236216 <location>Hub: undervoltage fault 24 V supply**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE (OFF1, OFF2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The 24 V power supply on the DRIVE-CLiQ Hub Module has undershot the fault threshold.  
Fault value (r0949, interpret decimal):  
Actual operating voltage in 0.1 °C resolution

**Remedy:** - check the supply voltage of the component involved.  
- replace the component involved.

---

**236217 <location>Hub: undervoltage alarm 24 V supply**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The 24 V power supply on the DRIVE-CLiQ Hub Module has undershot the alarm threshold.  
Alarm value (r2124, interpret decimal):  
Actual operating voltage in 0.1 °C resolution

**Remedy:** - check the supply voltage of the component involved.  
- replace the component involved.

---

**236800 <location>Hub: Group signal**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The DRIVE-CLiQ Hub Module has detected at least one fault.

**Remedy:** Evaluates other actual messages.

---

**236801 <location>Hub DRIVE-CLiQ: Sign-of-life missing**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the DRIVE-CLiQ Hub Module involved.  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:** - check the DRIVE-CLiQ connection.  
- replace the component involved.

---

**236802 <location>Hub: Time slice overflow**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A time slice overflow has occurred on the DRIVE-CLiQ Hub Module.  
Fault value (r0949, interpret decimal):  
xx: Time slice number xx

**Remedy:**

- reduce the current controller frequency.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

---

**236804 <location>Hub: Checksum error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A checksum error has occurred when reading out the program memory on the DRIVE-CLiQ Hub Module.  
Fault value (r0949, interpret hexadecimal):  
Difference between the checksum at POWER ON and the actual checksum.

**Remedy:**

- check whether the permissible ambient temperature for the component is maintained.
- replace the DRIVE-CLiQ Hub Module.

---

**236805 <location>Hub: EEPROM checksum incorrect**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The internal parameter data on the DRIVE-CLiQ Hub Module is incorrect.  
Alarm value (r2124, interpret hexadecimal):  
01: EEPROM access error.  
02: Too many blocks in the EEPROM.

**Remedy:**

- check whether the permissible ambient temperature for the component is maintained.
- replace the DRIVE-CLiQ Hub Module.

---

**236820 <location>Hub DRIVE-CLiQ: Telegram error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the DRIVE-CLiQ Hub Module involved.

Fault cause:

1 (= 01 hex):

Checksum error (CRC error).

2 (= 02 hex):

Telegram is shorter than specified in the length byte or in the receive list.

3 (= 03 hex):

Telegram is longer than specified in the length byte or in the receive list.

4 (= 04 hex):

The length of the receive telegram does not match the receive list.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the component in the telegram and in the receive list do not match.

7 (= 07 hex):

A SYNC telegram is expected - but the received telegram is not a SYNC telegram.

8 (= 08 hex):

No SYNC telegram is expected - but the received telegram is one.

9 (= 09 hex):

The error bit in the receive telegram is set.

16 (= 10 hex):

The receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

### **236835 <location>Hub DRIVE-CLiQ: Cyclic data transfer error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the DRIVE-CLiQ Hub Module involved. The nodes do not send and receive in synchronism.

Fault cause:

33 (= 21 hex):

The cyclic telegram has not been received.

34 (= 22 hex):

Timeout in the telegram receive list.

64 (= 40 hex):

Timeout in the telegram send list.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON.
- replace the component involved.

### **236836 <location>Hub DRIVE-CLiQ: Send error for DRIVE-CLiQ data**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the DRIVE-CLiQ Hub Module involved. Data were not able to be sent.  
Fault cause:  
65 (= 41 hex):  
Telegram type does not match send list.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause  
**Remedy:** Carry out a POWER ON.

---

**236837 <location>Hub DRIVE-CLiQ: Component fault**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** Component number: %1, fault cause: %2  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** Fault detected on the DRIVE-CLiQ component concerned. Faulty hardware cannot be excluded.  
Fault cause:  
32 (= 20 hex):  
Error in the telegram header.  
35 (= 23 hex):  
Receive error: The telegram buffer memory contains an error.  
66 (= 42 hex):  
Send error: The telegram buffer memory contains an error.  
67 (= 43 hex):  
Send error: The telegram buffer memory contains an error.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause  
**Remedy:**

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).
- check the electrical cabinet design and cable routing for EMC compliance
- if required, use another DRIVE-CLiQ socket (p9904).
- replace the component involved.

---

**236845 <location>Hub DRIVE-CLiQ: Cyclic data transfer error**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** Component number: %1, fault cause: %2  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the DRIVE-CLiQ Hub Module involved.  
Fault cause:  
11 (= 0B hex):  
Synchronization error during alternating cyclic data transfer.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause  
**Remedy:** Carry out a POWER ON.

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                 |
| <b>Cause:</b>         | <p>The properties of the DRIVE-CLiQ component (DRIVE-CLiQ Hub Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced.</p> <p>Fault value (r0949, interpret decimal):<br/>Component number.</p> |

**Remedy:**

- carry out a POWER ON.
- when a component is replaced, the same component type and if possible the same firmware version should be used.
- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

### 236899 <location>Hub: Unknown fault

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** New message: %1

**Reaction:** Infeed: NONE (OFF1, OFF2)  
Servo: NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP2)  
Hla: NONE (OFF1, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A fault occurred on the DRIVE-CLiQ Hub Module that cannot be interpreted by the Control Unit firmware. This can occur if the firmware on this component is more recent than the firmware on the Control Unit.  
Fault value (r0949, interpret decimal):  
Fault number.  
Note:  
If required, the significance of this new fault can be read about in a more recent description of the Control Unit.

**Remedy:**

- replace the firmware on the DRIVE-CLiQ Hub Module with older firmware (r0158).
- upgrade the firmware on the Control Unit (r0018).

---

### 236950 <location>Hub: Internal software error

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2 (NONE)

**Acknowledge:** POWER ON

**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret decimal):  
Information about the fault source.  
Only for internal Siemens troubleshooting.

**Remedy:**

- if required, upgrade the firmware in the DRIVE-CLiQ Hub Module to a more recent version.
- contact Technical Support.

**237004 <location>HF Damping Module: Heat sink overtemperature**

|                       |                        |
|-----------------------|------------------------|
| <b>Drive object:</b>  | SERVO_828, SERVO_COMBI |
| <b>Message value:</b> | %1                     |
| <b>Reaction:</b>      | OFF2                   |
| <b>Acknowledge:</b>   | IMMEDIATELY            |

**Cause:** The temperature of the heat sink in the HF Damping Module has exceeded the permissible limit value.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.

Fault value (r0949, interpret decimal):  
Temperature [0.01 °C].

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.

Notice:  
This fault can only be acknowledged after the alarm threshold for alarm A05000 has been undershot.

Note:  
HF Damping Module

### 237005 <location>HF Damping Module: I2t overload

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The filter capacitor of the HF Damping Module was overloaded (r5173 = 100 %).

- the filter resonance frequency was excessively excited.
- the HF Choke Module is defective.

Fault value (r0949, interpret decimal):  
I2t [100 % = 16384].

**Remedy:**

- reduce the motor power in the proximity of the fault-generating frequency.
- the system should not stay in a steady-state condition in the vicinity of the fault-generating frequency.
- check the HF Choke Module and if required replace.

Note:  
HF Choke Module (reactor module)

### 237013 <location>HF Damping Module: Heat sink temperature sensor short-circuit

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF1 (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** The heat sink temperature sensor in the HF Damping Module is short-circuited.  
 Fault value (r0949, interpret binary):  
 Bit 0: HF Damping Module  
 Bit 1: HF Choke Module

**Remedy:** Contact the manufacturer.  
 Note:  
 HF Choke Module (reactor module)  
 HF Damping Module

---

**237024**      **<location>HF Damping Module: Overtemperature thermal model**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The temperature difference between the heat sink and chip has exceeded the permissible limit value.  
 - the permissible load duty cycle was not maintained.  
 - insufficient cooling, fan failure.  
 - overload.  
 - ambient temperature too high.  
 - pulse frequency too high.  
 See also:r0037

**Remedy:** - adapt the load duty cycle.  
 - check whether the fan is running.  
 - check the fan elements.  
 - check whether the ambient temperature is in the permissible range.  
 - check the motor load.  
 - reduce the pulse frequency if this is higher than the rated pulse frequency.

---

**237025**      **<location>HF Damping Module: Chip overtemperature**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The chip temperature has exceeded the permissible limit value.  
 - the permissible load duty cycle was not maintained.  
 - insufficient cooling, fan failure.  
 - overload.  
 - ambient temperature too high.  
 - pulse frequency too high.  
 Fault value (r0949, interpret decimal):  
 Temperature difference between the heat sink and chip [0.01 °C].

**Remedy:** - adapt the load duty cycle.  
 - check whether the fan is running.  
 - check the fan elements.  
 - check whether the ambient temperature is in the permissible range.  
 - check the motor load.  
 - reduce the pulse frequency if this is higher than the rated pulse frequency.

**237034 <location>HF Damping Module: Internal overtemperature****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE

**Cause:** The alarm threshold for internal overtemperature has been reached.  
 If the temperature inside the unit continues to increase, fault F37036 may be triggered.

- ambient temperature might be too high.
- insufficient cooling, fan failure.

Fault value (r0949, interpret binary):  
 Bit 0 = 1: Control electronics range.  
 Bit 1 = 1: Power electronics range.

**Remedy:**

- check the ambient temperature.
- check the fan for the inside of the unit.

**Note:**

HF Damping Module

---

**237036 <location>HF Damping Module: Internal overtemperature****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY

**Cause:** The temperature inside the HF Damping Module has exceeded the permissible temperature limit.

- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.

Fault value (r0949, interpret binary):  
 Bit 0 = 1: Control electronics range.  
 Bit 1 = 1: Power electronics range.

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.

**Notice:**

This fault can only be acknowledged once the permissible temperature limit minus 5 K has been undershot.

**Note:**

HF Damping Module

---

**237040 <location>HF Damping Module: 24 V undervoltage****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** Failure of the 24 V power supply for the HF Damping Module.

- the undervoltage threshold was undershot for longer than 3 ms.

Fault value (r0949, interpret decimal):  
 24 V voltage [0.1 V].

**Remedy:**

- check the 24 V DC voltage supply of the HF Damping Module.
- carry out a POWER ON (switch-off/switch-on) for the component.

**Note:**

HF Damping Module

---

**237041 <location>HF Damping Module: 24 V undervoltage alarm****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** Fault in the 24 V power supply for the HF Damping Module.

- the 16 V threshold was undershot..

Alarm value (r2124, interpret decimal):

24 V voltage [0.1 V].

**Remedy:** - check the 24 V DC voltage supply of the HF Damping Module.

- carry out a POWER ON (switch-off/switch-on) for the component.

Note:

HF Damping Module

---

**237043 <location>HF Damping Module: 24 V overvoltage****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** -**Reaction:** OFF2**Acknowledge:** POWER ON**Cause:** Overvoltage of the 24 V power supply for the HF Damping Module.

- the 31.5 V threshold was exceeded for more than 3 ms.

**Remedy:** Check the 24 V DC voltage supply of the HF Damping Module.

Note:

HF Damping Module

---

**237044 <location>HF Damping Module: 24 V overvoltage alarm****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** -**Reaction:** NONE**Acknowledge:** NONE**Cause:** Fault in the 24 V power supply for the HF Damping Module.

- the 32.0 V threshold was exceeded.

**Remedy:** Check the 24 V DC voltage supply of the HF Damping Module.

Note:

HF Damping Module

---

**237045 <location>HF Damping Module: Supply undervoltage****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** Power supply fault in the HF Damping Module.

- the voltage monitor signals an undervoltage fault on the module.

Fault value (r0949, interpret decimal):

24 V voltage [0.1 V].

**Remedy:**

- check the 24 V DC voltage supply of the HF Damping Module.
- carry out a POWER ON (switch-off/switch-on) for the component.
- replace the module if necessary.

Note:

HF Damping Module

---

#### **237049 <location>HF Damping Module: Internal fan defective**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The internal fan of the HF Damping Module has failed.

**Remedy:** Check the internal fan of the HF Damping Module and replace if necessary.

---

#### **237050 <location>HF Damping Module: 24 V overvoltage fault**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** The voltage monitor signals an overvoltage fault on the module.

**Remedy:**

- check the 24 V power supply.
- replace the module if necessary.

---

#### **237052 <location>HF Damping Module: EEPROM data error**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** POWER ON

**Cause:** EEPROM data error of the HF Damping Module.

Fault value (r0949, interpret hexadecimal):

0: The EEPROM data read in from the HF Damping Module is inconsistent.

1: EEPROM data is not compatible to the firmware of the HF Damping Module.

Additional values:

Only for internal Siemens troubleshooting.

**Remedy:** For fault value = 0:

Replace the HF Damping Module or update the EEPROM data.

For fault value = 1:

If necessary, upgrade the firmware to a later version.

Note:

HF Damping Module

---

#### **237056 <location>HF Damping Module: Heat sink overtemperature**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The temperature of the HF Damping Module heat sink has exceeded the permissible limit value.  
 - insufficient cooling, fan failure.  
 - overload.  
 - ambient temperature too high.  
 Alarm value (r2124, interpret decimal):  
 Temperature [0.01 °C].

**Remedy:** - check whether the fan is running.  
 - check the fan elements.  
 - check whether the ambient temperature is in the permissible range.

Notice:  
 This fault can only be acknowledged after the alarm threshold for alarm A05000 has been undershot.

Note:  
 HF Damping Module

---

**237310 <location>HF Choke Module: Overtemperature**

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE

**Cause:** The temperature of the HF Choke Module heat sink has exceeded the permissible limit value.  
 - insufficient cooling, fan failure.  
 - overload.  
 - ambient temperature too high.  
 Alarm value (r2124, interpret decimal):  
 Temperature [0.01 °C].

**Remedy:** - check whether the fan is running.  
 - check the fan elements.  
 - check whether the ambient temperature is in the permissible range.

Notice:  
 This fault can only be acknowledged after the alarm threshold for alarm A05000 has been undershot.

Note:  
 HF Choke Module (reactor module)

---

**237311 <location>HF Choke Module: Heat sink overtemperature**

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY

**Cause:** The temperature of the HF Choke Module heat sink has exceeded the permissible limit value.  
 - insufficient cooling, fan failure.  
 - overload.  
 - ambient temperature too high.  
 Fault value (r0949, interpret decimal):  
 Temperature [0.01 °C].

**Remedy:**

- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.

**Notice:**  
This fault can only be acknowledged after this alarm threshold for alarm A05000 has been undershot.

**Note:**  
HF Choke Module (reactor module)

---

### 237312 <location>HF Choke Module: Overtemperature or fan failure

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The HF Choke Module signals an overtemperature or fan failure.  
Fault F37313 is output if the alarm is present for longer than 30 s.

**Remedy:**

- the cable between the HF Choke Module and the HF Damping Module has been withdrawn or is defective (X21).
- check the fan of the HF Choke Module and replace if necessary.
- check whether the ambient temperature is in the permissible range.

**Note:**  
HF Choke Module (reactor module)  
HF Damping Module

---

### 237313 <location>HF Choke Module: Overtemperature or fan failure

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** Alarm A37312 to display overtemperature or fan failure in the HF Choke Module was signaled for longer than 30 s.

**Remedy:**

- the cable between the HF Choke Module and the HF Damping Module has been withdrawn or is defective (X21).
- check the fan of the HF Choke Module and replace if necessary.
- check whether the ambient temperature is in the permissible range.

**Note:**  
HF Choke Module (reactor module)  
HF Damping Module

---

### 237502 <location>HF Damping Module: Damping voltage too high

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The damping voltage has exceeded the alarm threshold.

- a motor harmonic with a high amplitude has coincided with the resonance frequency of the output filter.
- the current controller excessively excites the resonance of the output filter.

If the damping voltage exceeds an inadmissibly high value, F37002 is output.

Alarm value (r2124, interpret decimal):  
Damping voltage in the case of a fault [mV].  
See also:r5171 (HF damping voltage actual value)

**Remedy:**

- reduce the motor power in the proximity of the fault-generating frequency.
- check the current controller and if required, adapt.
- if required, use another motor.

**Note:**  
HF Damping Module

---

**237800 <location>HF Damping Module: Group signal**

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The HF Damping Module has detected at least one fault.  
**Remedy:** Evaluates other actual messages.

---

**237801 <location>HF Damping Module: Sign-of-life missing**

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** Component number: %1, fault cause: %2  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** There is a DRIVE-CLiQ communication error between the Control Unit and the HF Damping Module.  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause  
**Remedy:**

- check the DRIVE-CLiQ connection.
- replace the component involved.

**Note:**  
HF Damping Module

---

**237802 <location>HF Damping Module: time slice overflow**

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A time slice overflow has occurred.  
**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

---

**237804 <location>HF Damping Module: CRC**

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** OFF2 (OFF1, OFF3)  
**Acknowledge:** IMMEDIATELY  
**Cause:** A checksum error (CRC error) has occurred for the HF Damping Module.

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

**Note:**  
HF Damping Module

---

### **237805 <location>HF Damping Module: EEPROM checksum incorrect**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** Internal parameter data is corrupted.  
Fault value (r0949, interpret hexadecimal):  
01: EEPROM access error.  
02: Too many blocks in the EEPROM.

**Remedy:** Replace the module.

**Note:**  
HF Damping Module

---

### **237820 <location>HF Damping Module: Telegram error**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communication error has occurred from the Control Unit to the damping module.  
Fault cause:  
1 (= 01 hex):  
Checksum error (CRC error).  
2 (= 02 hex):  
Telegram is shorter than specified in the length byte or in the receive list.  
3 (= 03 hex):  
Telegram is longer than specified in the length byte or in the receive list.  
4 (= 04 hex):  
The length of the receive telegram does not match the receive list.  
5 (= 05 hex):  
The type of the receive telegram does not match the receive list.  
6 (= 06 hex):  
The address of the component in the telegram and in the receive list do not match.  
7 (= 07 hex):  
A SYNC telegram is expected - but the received telegram is not a SYNC telegram.  
8 (= 08 hex):  
No SYNC telegram is expected - but the received telegram is one.  
9 (= 09 hex):  
The error bit in the receive telegram is set.  
16 (= 10 hex):  
The receive telegram is too early.  
**Note regarding the message value:**  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

Note:

HF Damping Module

---

**237835 <location>HF Damping Module: Cyclic data transmission error**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** There is a DRIVE-CLiQ communication error between the Control Unit and the HF Damping Module. The nodes do not send and receive in synchronism.

Fault cause:

33 (= 21 hex):

The cyclic telegram has not been received.

34 (= 22 hex):

Timeout in the telegram receive list.

64 (= 40 hex):

Timeout in the telegram send list.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON.
- replace the component involved.

Note:

HF Damping Module

---

**237836 <location>HF Damping Module: Send error for DRIVE-CLiQ data**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1, fault cause: %2

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** There is a DRIVE-CLiQ communication error between the Control Unit and the HF Damping Module. Data were not able to be sent.

Fault cause:

65 (= 41 hex):

Telegram type does not match send list.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON.

**237851      <location>HF Damping Module (CU): Sign-of-life missing****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** Component number: %1, fault cause: %2**Reaction:** NONE**Acknowledge:** IMMEDIATELY**Cause:** DRIVE-CLiQ communication error from the HF Damping Module to the Control Unit.

The DRIVE-CLiQ component did not set the sign-of-life to the Control Unit.

Fault cause:

10 (= 0A hex):

The sign-of-life bit in the receive telegram is not set.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Upgrade the firmware of the component involved.

Note:

HF Damping Module

### 237895 <location>HF Damping Module (CU): Alternating cyclic data transmission error

|                       |                                       |
|-----------------------|---------------------------------------|
| <b>Drive object:</b>  | SERVO_828, SERVO_COMBI                |
| <b>Message value:</b> | Component number: %1, fault cause: %2 |
| <b>Reaction:</b>      | NONE                                  |
| <b>Acknowledge:</b>   | IMMEDIATELY                           |

**Cause:** DRIVE-CLiQ communication error from the HF Damping Module to the Control Unit.

Fault cause:

11 (= 0B hex):

Synchronization error during alternating cyclic data transfer.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON.

Note:

HF Damping Module

---

**237896 <location>HF Damping Module (CU): Component properties inconsistent**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Component number: %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The properties of the DRIVE-CLiQ component (HF Damping Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ component has been replaced.

Fault value (r0949, interpret decimal):

Component number.

**Remedy:** - carry out a POWER ON.

- when a component is replaced, the same component type and if possible the same firmware version should be used.

- when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

Note:

HF Damping Module

---

**237899 <location>HF Damping Module: Unknown fault**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** New message: %1

**Reaction:** NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A fault has occurred on the HF Damping Module that cannot be interpreted by the Control Unit firmware.

This can occur if the firmware on this component is more recent than the firmware on the Control Unit.

Fault value (r0949, interpret decimal):

Fault number.

Note:

If required, the significance of this new fault can be read about in a more recent description of the Control Unit.

**Remedy:** - replace the firmware on the HF Damping Module by an older firmware version (r0168).

- upgrade the firmware on the Control Unit (r0018).

Note:

HF Damping Module

---

**237903 <location>HF Damping Module: I2C bus error occurred**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** Communications error with an EEPROM or an analog/digital converter.

Fault value (r0949, interpret hexadecimal):

80000000 hex:

- internal software error.

00000001 hex ... 0000FFFF hex:

- module fault.

**Remedy:** For fault value = 80000000 hex:

- upgrade firmware to later version.

For fault value = 00000001 hex ... 0000FFFF hex:

- replace the module.

Note:

HF Damping Module

---

### 237950 <location>HF Damping Module: Internal software error

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** An internal software error has occurred.

Fault value (r0949, interpret decimal):

Information about the fault source.

Only for internal Siemens troubleshooting.

**Remedy:** - if necessary, upgrade the firmware in the HF Damping Module to a later version.

- contact Technical Support.

Note:

HF Damping Module

---

### 237999 <location>HF Damping Module: Unknown alarm

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** New message: %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An alarm has occurred on the HF Damping Module that cannot be interpreted by the Control Unit firmware.

This can occur if the firmware on this component is more recent than the firmware on the Control Unit.

Alarm value (r2124, interpret decimal):

Alarm number.

Note:

If required, the significance of this new alarm can be read about in a more recent description of the Control Unit.

**Remedy:** - replace the firmware on the HF Damping Module by an older firmware version (r0168).

- upgrade the firmware on the Control Unit (r0018).

Note:

HF Damping Module

---

### 240000 <location>Fault at DRIVE-CLiQ socket X100

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred at the drive object at the DRIVE-CLiQ socket X100.  
Fault value (r0949, interpret decimal):  
First fault that has occurred for this drive object.

**Remedy:** Evaluate the fault buffer of the specified object.

---

**240001 <location>Fault at DRIVE-CLiQ socket X101**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred at the drive object at the DRIVE-CLiQ socket X101.  
Fault value (r0949, interpret decimal):  
First fault that has occurred for this drive object.

**Remedy:** Evaluate the fault buffer of the specified object.

---

**240002 <location>Fault at DRIVE-CLiQ socket X102**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred at the drive object at the DRIVE-CLiQ socket X102.  
Fault value (r0949, interpret decimal):  
First fault that has occurred for this drive object.

**Remedy:** Evaluate the fault buffer of the specified object.

---

**240003 <location>Fault at DRIVE-CLiQ socket X103**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred at the drive object at the DRIVE-CLiQ socket X103.  
Fault value (r0949, interpret decimal):  
First fault that has occurred for this drive object.

**Remedy:** Evaluate the fault buffer of the specified object.

---

**240004 <location>Fault at DRIVE-CLiQ socket X104**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred at the drive object at the DRIVE-CLiQ socket X104.  
Fault value (r0949, interpret decimal):  
First fault that has occurred for this drive object.

**Remedy:** Evaluate the fault buffer of the specified object.

**240801 <location>CX32 DRIVE-CLiQ: Sign-of-life missing**

**Drive object:** 'All objects  
**Message value:** Component number: %1, fault cause: %2  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the controller extension involved.  
Fault cause:  
10 (= 0A hex):  
The sign-of-life bit in the receive telegram is not set.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause  
**Remedy:** - carry out a POWER ON (switch-off/switch-on).  
- replace the component involved.

---

**240820 <location>CX32 DRIVE-CLiQ: Telegram error**

**Drive object:** 'All objects  
**Message value:** Component number: %1, fault cause: %2  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the controller extension involved.

Fault cause:

1 (= 01 hex):

Checksum error (CRC error).

2 (= 02 hex):

Telegram is shorter than specified in the length byte or in the receive list.

3 (= 03 hex):

Telegram is longer than specified in the length byte or in the receive list.

4 (= 04 hex):

The length of the receive telegram does not match the receive list.

5 (= 05 hex):

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the component in the telegram and in the receive list do not match.

7 (= 07 hex):

A SYNC telegram is expected - but the received telegram is not a SYNC telegram.

8 (= 08 hex):

No SYNC telegram is expected - but the received telegram is one.

9 (= 09 hex):

The error bit in the receive telegram is set.

16 (= 10 hex):

The receive telegram is too early.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

## **240825 <location>CX32 DRIVE-CLiQ: Supply voltage failed**

**Drive object:** 'All objects

**Message value:** Component number: %1, fault cause: %2

**Reaction:** OFF1 (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.

Fault cause:

9 (= 09 hex):

The power supply voltage for the components has failed.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the supply voltage wiring of the DRIVE-CLiQ component (interrupted cable, contacts, ...).
- check the dimensioning of the DRIVE-CLiQ component power supply.

## **240835 <location>CX32 DRIVE-CLiQ: Cyclic data transfer error**

**Drive object:** 'All objects

**Message value:** Component number: %1, fault cause: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

| <b>Cause:</b>         | <p>Fault detected on the DRIVE-CLiQ component concerned. Faulty hardware cannot be excluded.</p> <p>Fault cause:</p> <p>32 (= 20 hex):</p> <p>Error in the telegram header.</p> <p>35 (= 23 hex):</p> <p>Receive error: The telegram buffer memory contains an error.</p> <p>66 (= 42 hex):</p> <p>Send error: The telegram buffer memory contains an error.</p> <p>67 (= 43 hex):</p> <p>Send error: The telegram buffer memory contains an error.</p> <p>Note regarding the message value:</p> <p>The individual information is coded as follows in the message value (r0949/r2124):</p> <p>0000yyxx hex: yy = component number, xx = error cause</p> |

**Remedy:**

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).
- check the electrical cabinet design and cable routing for EMC compliance
- if required, use another DRIVE-CLiQ socket (p9904).
- replace the component involved.

---

#### **240845      <location>CX32 DRIVE-CLiQ: Cyclic data transfer error**

**Drive object:** 'All objects

**Message value:** Component number: %1, fault cause: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the Control Unit to the controller extension involved.  
 Fault cause:  
 11 (= 0B hex):  
 Synchronization error during alternating cyclic data transfer.  
 Note regarding the message value:  
 The individual information is coded as follows in the message value (r0949/r2124):  
 0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON (switch-off/switch-on).

---

#### **240851      <location>CX32 DRIVE-CLiQ (CU): Sign-of-life missing**

**Drive object:** 'All objects

**Message value:** Component number: %1, fault cause: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit.  
 The DRIVE-CLiQ component did not set the sign-of-life to the Control Unit.  
 Fault cause:  
 10 (= 0A hex):  
 The sign-of-life bit in the receive telegram is not set.  
 Note regarding the message value:  
 The individual information is coded as follows in the message value (r0949/r2124):  
 0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Upgrade the firmware of the component involved.

| <b>Reaction:</b>      | OFF1 (OFF2)                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Cause:</b>         | <p>The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.</p> <p>Fault cause:</p> <p>9 (= 09 hex):<br/>The power supply voltage for the components has failed.</p> <p>Note regarding the message value:<br/>The individual information is coded as follows in the message value (r0949/r2124):<br/>0000yyxx hex: yy = component number, xx = error cause</p> |

**Remedy:**

- carry out a POWER ON (switch-off/switch-on).
- check the supply voltage wiring of the DRIVE-CLiQ component (interrupted cable, contacts, ...).
- check the dimensioning of the DRIVE-CLiQ component power supply.

---

#### **240885      <location>CX32 DRIVE-CLiQ (CU): Cyclic data transfer error**

**Drive object:** 'All objects

**Message value:** Component number: %1, fault cause: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit.  
The nodes do not send and receive in synchronism.  
Fault cause:  
26 (= 1A hex):  
Sign-of-life bit in the receive telegram not set and the receive telegram is too early.  
33 (= 21 hex):  
The cyclic telegram has not been received.  
34 (= 22 hex):  
Timeout in the telegram receive list.  
64 (= 40 hex):  
Timeout in the telegram send list.  
98 (= 62 hex):  
Error at the transition to cyclic operation.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- check the power supply voltage of the component involved.
- carry out a POWER ON (switch-off/switch-on).
- replace the component involved.

---

#### **240886      <location>CX32 DRIVE-CLiQ (CU): Error when sending DRIVE-CLiQ data**

**Drive object:** 'All objects

**Message value:** Component number: %1, fault cause: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit.  
Data were not able to be sent.  
Fault cause:  
65 (= 41 hex):  
Telegram type does not match send list.  
Note regarding the message value:  
The individual information is coded as follows in the message value (r0949/r2124):  
0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON (switch-off/switch-on).

---

#### **240887      <location>CX32 DRIVE-CLiQ (CU): Component fault**

**Drive object:** 'All objects

**Message value:** Component number: %1, fault cause: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** Fault detected on the DRIVE-CLiQ component concerned. Faulty hardware cannot be excluded.

Fault cause:

32 (= 20 hex):

Error in the telegram header.

35 (= 23 hex):

Receive error: The telegram buffer memory contains an error.

66 (= 42 hex):

Send error: The telegram buffer memory contains an error.

67 (= 43 hex):

Send error: The telegram buffer memory contains an error.

96 (= 60 hex):

Response received too late during runtime measurement.

97 (= 61 hex):

Time taken to exchange characteristic data too long.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:**

- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).
- check the electrical cabinet design and cable routing for EMC compliance
- if required, use another DRIVE-CLiQ socket (p9904).
- replace the component involved.

---

**240895 <location>CX32 DRIVE-CLiQ (CU): Cyclic data transfer error**

**Drive object:** 'All objects

**Message value:** Component number: %1, fault cause: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit.

Fault cause:

11 (= 0B hex):

Synchronization error during alternating cyclic data transfer.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

0000yyxx hex: yy = component number, xx = error cause

**Remedy:** Carry out a POWER ON (switch-off/switch-on).

---

**249150 <location>Cooling unit: Fault occurred**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The cooling unit signals a general fault.

**Remedy:**

- check the wiring between the cooling unit and the input terminal (Terminal Module).
- check the external control device for the cooling unit.

See also: p0266 (Cooling unit feedback signals signal source)

---

**249151 <location>Cooling unit: Conductivity has exceeded the fault threshold**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828

**Message value:** -

**Reaction:** OFF2

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Acknowledge:** POWER ON  
**Cause:** The firmware version in the Power Stack Adapter (PSA) is too old and does not support the liquid cooling.  
**Remedy:** Upgrade the firmware. Check EEPROM data.

---

**249156 <location>Cooling unit: Cooling liquid temperature has exceeded the fault threshold**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828  
**Message value:** -  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The cooling liquid intake temperature has exceeded the specified fault threshold.  
**Note:**  
The value for the fault threshold depends on the power unit (hardware description data, e.g. 52 ... 55 °C).  
**Remedy:** Check the cooling system and the ambient conditions.

---

**249170 <location>Cooling unit: Alarm has occurred**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The cooling unit signals a general alarm.  
**Remedy:** - check the wiring between the cooling unit and the input terminal (Terminal Module).  
- check the external control device for the cooling unit.

---

**249171 <location>Cooling unit: Conductivity has exceeded the alarm threshold**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The conductivity of the cooling liquid has exceeded the selected alarm threshold (p0269[1]).  
**Note:**  
The threshold cannot be set higher than the fault threshold specified in the equipment description.  
**Remedy:** Check the device to de-ionize the cooling liquid.

---

**249172 <location>Cooling unit: Conductivity actual value is not valid**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** When monitoring the conductivity of the cooling liquid, there is a fault in the wiring or in the sensor.  
**Remedy:** - check the wiring between the cooling unit and the Power Stack Adapter (PSA).  
- check the function of the sensor to measure the conductivity.

---

**249173 <location>Cooling unit: Cooling liquid temperature has exceeded the alarm threshold**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE

**Cause:** The cooling liquid intake temperature has exceeded the specified alarm threshold.  
**Note:**  
 The value for the alarm threshold depends on the power unit (hardware description data, e.g. 42 ... 50 °C).  
**Remedy:** Check the cooling system and the ambient conditions.

**249920 <location>Protective breaker main circuit tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The protective breaker in the main circuit of the power supply has tripped.  
**Note:**  
 This message is output via the signal source of binector input p6577[1] of the Control Unit.  
**Remedy:** Check the main circuit.

**249921 <location>Protective breaker redundant main circuit tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The protective breaker in the main circuit for the redundant feed to the power supply has tripped.  
**Note:**  
 This message is output via the signal source of binector input p6577[2] of the Control Unit.  
**Remedy:** Check the redundant main circuit.

**249922 <location>Protective breaker 24 V circuit has tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A protective breaker in the 24 V circuit has tripped.  
**Note:**  
 This message is output via the signal source of binector input p6577[3] of the Control Unit.  
**Remedy:** Check the 24 V circuit

**249923 <location>Protective breaker terminal strip 24 V circuit has tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A protective breaker for the terminal strip in the 24 V circuit has tripped.  
**Note:**  
 This message is output via the signal source of binector input p6577[6] of the Control Unit.  
**Remedy:** Check the terminal strip for the 24 V circuit.

---

**249924 <location>Protective breaker power unit supply circuit tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A protective breaker in the circuit of the power unit supply has tripped.

**Note:**

This message is output via the signal source of binector input p6577[9] of the Control Unit.

**Remedy:** Check the power unit supply circuit.

---

**249926 <location>Protective breaker synchronizing voltage tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A protective breaker for the synchronizing voltage has tripped.

**Note:**

This message is output via the signal source of binector input p6577[13] of the Control Unit.

**Remedy:** Check the synchronizing voltage.

---

**249927 <location>Protective breaker auxiliary fan circuit has tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The protective breaker in the fan circuit of the auxiliary fan has tripped.

**Note:**

This message is output via the signal source of binector input p6577[14] of the Control Unit.

**Remedy:** Check the auxiliary fan.

---

**249933 <location>Protective breaker excitation 230 V AC circuit tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The protective breaker in the 230 V AC circuit of the excitation has tripped.

**Note:**

This message is output via the signal source of binector input p6577[17] of the Control Unit.

**Remedy:** Check the 230 V AC circuit of the excitation.

---

**249934 <location>Protective breaker output cooling unit 230 V AC circuit tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The protective breaker in the 230 V AC circuit of the outgoing feeder of the cooling unit has tripped.

**Note:**

This message is output via the signal source of binector input p6577[18] of the Control Unit.

**Remedy:** Check the 230 V AC circuit of the outgoing feeder of the cooling unit.

#### **249935 <location>Protective breaker power unit door solenoids 24 V circuit has tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The protective breaker in the 24 V circuit of the door solenoids in the power unit has tripped.

**Note:**

This message is output via the signal source of binector input p6577[19] of the Control Unit.

**Remedy:** Check the 24 V circuit of the door solenoids in the power unit.

#### **249936 <location>Prot. breaker lighting supply/socket outlets 230V AC cct has tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The protective breaker in the 230 V AC circuit for the lighting supply/socket outlets has tripped.

**Note:**

This message is output via the signal source of binector input p6577[20] of the Control Unit.

**Remedy:** Check the 230V AC circuit for the lighting supply/socket outlets.

#### **249937 <location>UPS not ready**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The uninterruptible power supply (UPS) is not ready.

**Note:**

This message is output via the signal source of binector input p6577[25] of the Control Unit.

UPS: Uninterruptible Power Supply

**Remedy:** Check the UPS.

#### **249938 <location>UPS battery operation**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The uninterruptible power supply (UPS) is in battery operation.

**Note:**

This message is output via the signal source of binector input p6577[26] of the Control Unit.

UPS: Uninterruptible Power Supply

**Remedy:** Check the power supply of the control cabinet.

---

**249939 <location>UPS battery discharged**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The uninterruptible power supply (UPS) battery is discharged.

**Note:**

This message is output via the signal source of binector input p6577[27] of the Control Unit.

UPS: Uninterruptible Power Supply

**Remedy:** Check the UPS battery.

---

**249940 <location>Protective breaker tripped PU supply 400 V circuit**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The protective breaker for the 400 V AC supply of the power unit has tripped.

**Note:**

This message is output via the signal source of binector input p6577[28] of the Control Unit.

**Remedy:** Check the 400 V AC supply voltage for the power unit.

---

**249941 <location>Protective breaker anti-condensation heating tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The protective breaker for the anti-condensation heating was tripped.

**Note:**

This message is output via the signal source of binector input p6577[29] of the Control Unit.

**Remedy:** Check the anti-condensation heating circuit.

---

**249942 <location>Protective breaker SITOP supply circuit tripped**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The protective breaker for the SITOP 24 V circuit has tripped.

**Note:**

This message is output via the signal source of binector input p6577[21] of the Control Unit.

**Remedy:** Check the SITOP power supply.

---

**249998 <location>Recorder trigger event occurred**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

A receive telegram word is greater than possible in the project.  
Alarm value (r2124, interpret hexadecimal):  
yyyyxxxx hex: yyyy = info. 1, xxxx = info. 2  
Info. 1 (decimal) = drive object number from p8870  
Info. 2 (decimal) = index from p8870  
See also:p8870 (SINAMICS Link PZD receive word)

**Remedy:** In the case of CBE20 SINAMICS Link:  
Correct the parameter assignment.

---

**250011 <location>EtherNet/IP/COMM BOARD: configuration error**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** CBE20 EtherNet/IP:  
An EtherNet/IP controller attempts to establish a connection using an incorrect configuring telegram.  
The telegram length set in the controller does not match the parameterization in the drive device.

**Remedy:** Check the set telegram length.  
Note:  
PZD interface 1:  
For p0922 not equal to 999, then the length of the selected telegram applies.  
For p0922 = 999, the maximum interconnected PZD (r2067) applies.  
PZD interface 2:  
The maximum interconnected PZD (r8867) applies.

| <b>Explanation:</b>           | An attempt to save a data block, e.g. the result of a measuring function, in the file system has failed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Reaction:</b>              | Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Remedy:</b>                | Inform the authorized personnel/service department.<br>You have the following possibilities of eliminating the error:<br>Ensure that there is adequate memory in the file system. For example, delete 2 NC programs or create an additional 4 to 8 kbytes of memory space.<br>Increase the number of files per directory or the total size of the file system itself. This requires the following actions: <ul style="list-style-type: none"><li>- A complete data backup</li><li>- Change the settings of machine data</li><li>- MD18280 \$MM_NUM_FILES_PER_DIR</li><li>- MD18320 \$MM_NUM_FILES_IN_FILESYSTEM</li><li>- MD18321 \$MM_MAXNUM_SYSTEM_FILES_IN_FILESYSTEM</li><li>- MD18350 \$MM_USER_FILE_MEM_MINIMUM</li><li>- and, if necessary, of</li><li>- MD18270 \$MM_NUM_SUBDIR_PER_DIR</li><li>- MD18310 \$MM_NUM_DIR_IN_FILESYSTEM</li><li>- Power On</li><li>- Reload the data backup</li></ul> |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**300423 Measuring result could not be read (%1)****Parameters:** %1 = Error code**Explanation:** An attempt to read a measurement result has failed:  
- Error code = 4: Not enough space for test result  
- Error code = 16: Measurement not yet finished**Reaction:** Interface signals are set.  
Alarm display.**Remedy:** Repeat the measurement. Alter the measuring time if necessary.**Programm continuation:** Clear alarm with the RESET key. Restart part program**380001 PROFIBUS/PROFINET: Startup error, reason %1 parameter %2 %3 %4.****Parameters:** %1 = Cause of the error  
%2 = Parameter 1  
%3 = Parameter 2  
%4 = Parameter 3**Explanation:** An error occurred during startup of the PROFIBUS/PROFINET master.  
Overview: Cause of the error, Par 1, Par 2, Par 3:  
- 01 = DPM version, DPM version, DPA version, --  
- 02 = DPM ramp-up timeout, DPM actual value status, DPM setpoint value status, --  
- 03 = DPM ramp-up status, DPM actual value status, DPM setpoint value status, DPM error code  
- 04 = DPM ramp-up error, DPM actual value status, DPM setpoint value status, DPM error code  
- 05 = DPM-PLL sync error, --, --, --  
- 07 = Alarm queue too long, Actual number, Setpoint number, --  
- 08 = Unknown client, Client ID, --, --  
- 09 = Client version, Client ID, Client version, DPA version  
- 10 = Too many clients, Client number, max. number of clients, --  
- 11 = Log.basic address used several times; bus no.; slot no.; log.basic address --  
- 20 = Slave/device address used several times, slave/device address --  
- 21 = Slave/device address unknown, slave/device address, --  
- 22 = Erroneous configuration telegram, slave/device address, error code, --  
- 23 = OMI incompatible (data), drive version, CDA version, --, --  
- 24 = OMI incompatible (driver), drive version, CDA version, --, --  
- 25 = CPI initialization failed, error code, --, --, --  
- 26 = DMA not active  
- 27 = Reserved  
- 28 = Reserved  
- 29 = Reserved  
- The 1000s digit of the error cause = number of the affected bus  
- (Special case: Error causes in the 5000 range indicate problems with the NCU-LINK communication)  
Clients are the following components of the control system that use the PROFIBUS/PROFINET:  
Client ID = 1: PLC  
Client ID = 2: NCK  
Possible causes are:  
- Error in contents of PROFIBUS/PROFINET configuration  
- Corruption of parts of the system program  
- Hardware defect on NC component  
**Reaction:** Channel not ready.  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

Remedy for 1-11

1. Check the control project, check MD11240 \$MN\_PROFIBUS\_SDB\_NUMBER, and reload it when using a user-specific SDB.
2. Increase the monitoring time for the PLC run-up in MD10120 \$MN\_PLC\_RUNNINGUP\_TIMEOUT
3. If the error still occurs, back up data, and restart the control with the standard values as per the as-delivered condition.
4. If run-up is satisfactory, reload the user data stage by stage.
5. If the error still occurs during run-up with standard values, reboot the system from the PC card or update the software.
6. If the error still occurs, replace the hardware.

Remedy for 20-21

1. Check/correct the addresses of the connected slaves/devices.

Remedy for 22

See SINAMICS warning 1903 for a description of the meaning behind the error codes.

1. Check PROFIBUS/PROFINET configuration
  - Check the type and length of the message frame
  - Match slot assignment with P978
2. Evaluate the drive alarms/warnings

Remedy for 23-24

1. Software replacement required

Remedy for 25

1. Change the message frame type
2. Reduce the number of slots
3. Reduce the number of slaves/devices
4. Create a new PROFIBUS/PROFINET configuration
5. Software must be replaced

If the error can still not be rectified after this procedure, send the error message to the control manufacturer.

**Programm  
continuation:**

Switch control OFF - ON.

---

**380003 PROFIBUS/PROFINET: Operating error, reason %1 parameter %2 %3 %4.****Parameters:**

%1 = Cause of the error  
%2 = Parameter 1  
%3 = Parameter 2  
%4 = Parameter 3

**Explanation:**

An operating error occurred on the PROFIBUS/PROFINET in cyclic mode.

Overview: Cause of the error, Par 1, Par 2, Par 3:

- 01 = unknown alarm, alarm class, logical address, --
- 02 = DPM cycle timeout, DPM actual value status, DPM setpoint value status, --
- 03 = DPM cycle status, DPM actual value status, DPM setpoint value status, DPM error code
- 04 = DPM cycle error, DPM actual value status, DPM setpoint value status, DPM error code
- 05 = Client not registered, client number, max. number of clients, --
- 06 = Synchronization error, number of sync violation, --, --
- 07 = Spinlock timeout, PLC spinlock, NCK spinlock, --
- 1000s digit of the error cause = number of the affected bus
- (Special case: Error causes in the 5000 range indicate problems with the NCU-LINK communication)

Alarm class: (see alarm 380 060)

The following can be primary causes:

- For error cause 01: Data transfer error on the PROFIBUS/PROFINET
- For error causes 02, 03, 04: Error in contents of PROFIBUS/PROFINET configuration
- For error causes 02, 03, 04, 05, 07: Corruption of parts of system program
- For error cause 06: The PCI bus cycle does not match the expected rate, so synchronization is not possible. The correct PCI bus cycle must be entered.

The error can also be caused by a hardware problem on the MCI module.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>380005</b>                 | <b>PROFIBUS/PROFINET: Bus access conflict</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Explanation:</b>           | An access conflict occurred on the PROFIBUS/PROFINET in cyclic mode: An attempt has been made in the NCK to write data to the bus or to read from the bus while cyclic data transfer was active. This may lead to inconsistent data, sign-of-life errors or additional transmission dead times on the bus.                                                                                                                                                                                                                     |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | <ul style="list-style-type: none"> <li>- Check the effective timing in MD10063 \$MN_POSCTRL_CYCLE_DIAGNOSIS, and ensure in particular that the settings in MD10050 \$MN_SYSCLOCK_CYCLE_TIME and MD10062 \$MN_POSCTRL_CYCLE_DELAY are correct:</li> <li>- Use MD10062 \$MN_POSCTRL_CYCLE_DELAY = 0 for automatic setting of the position control cycle delay.</li> <li>- If alarm-free operation cannot be achieved with MD10062 \$MN_POSCTRL_CYCLE_DELAY = 0, MD10050 \$MN_SYSCLOCK_CYCLE_TIME should be increased.</li> </ul> |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**380022 PROFIBUS/PROFINET: Configuration of DP master bus %1 has been changed**

|                               |                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Number of the affected bus                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Explanation:</b>           | The PROFIBUS/PROFINET configuration on the DP master was changed during operation, e.g. by downloading a new hardware configuration. As the cycle data may also have changed, operation cannot be continued, and a warm restart is required.<br><br>If the master functionality is within the PLC, the PLC will have been stopped anyway for the download, and alarm 2000 (PLC sign-of-life) output. |
| <b>Reaction:</b>              | Channel not ready.<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                                                                                                                                                                                              |
| <b>Remedy:</b>                | NCK restart<br><br>If the error cannot be eliminated by this procedure, please make a note of the error text and contact the control system manufacturer.                                                                                                                                                                                                                                            |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Parameters:</b>            | %1 = Slave/device address<br>%2 = Number of the affected bus<br>%3 = PROFINET: Logical start address with input-IOPS=BAD                                                                                                                                                                                                                                                                                                              |
| <b>Explanation:</b>           | Failure of a PROFIBUS/PROFINET slot used by the NCK for digital or analog I/Os.<br>PROFINET: Input IOPS=BAD was reported at logical start address                                                                                                                                                                                                                                                                                     |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Remedy:</b>                | Check that the slave/device is operating correctly (all slaves/devices must be included in the bus, green LEDs).                                                                                                                                                                                                                                                                                                                      |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                                                                                                                                                                                                                                                |

---

**380076 PROFIBUS/PROFINET: No DO1 message frame: Bus %2 slave/device %1****Parameters:** %1 = Slave/device address

%2 = Number of the affected bus

**Explanation:** Note for the system setup engineer: A PROFIBUS slave/PROFINET device used as an NCK drive does not have a valid DO1 message frame assignment (see MD13120 \$MN\_CONTROL\_UNIT\_LOGIC\_ADDRESS with the PROFIBUS/PROFINET configuration).

This alarm indicates that the alarm time-of-day synchronization is not working between the controller and this slave/device.

**Reaction:** Alarm display.**Remedy:** Enter a valid value in MD13120 \$MN\_CONTROL\_UNIT\_LOGIC\_ADDRESS.**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**380077 PROFIBUS/PROFINET: Too many DOs: Currently minimum %2, maximum %3 in DO group %1****Parameters:** %1 = DO group

%2 = Current number of DOs

%3 = Maximum permissible number of DOs

**Explanation:** Note for the system setup engineer: The number of equivalent DOs ("drive objects" group) on all busses (configured and connected) exceeds predefined limit values.

The services linked to these DOs (e.g. time synchronization, alarm display, HMI diagnostics, HMI data archiving) can no longer be guaranteed for all DOs in this group.

The following different DO groups exist (see parameter %1):

0 = Device (CU, DO1)

1 = Communications (CU-LINK)

2 = Drive (SERVO, VECTOR)

3 = Infeed (ALM etc.)

4 = Terminal block (TB)

5 = Terminal module (TM)

**Reaction:** Alarm display.**Remedy:** Reduce the number of devices (containing DOs of this type) on the bus.

Use a more powerful type of controller (one which supports more DOs).

**Programm continuation:** Switch control OFF - ON.

---

**380500 PROFIBUS/PROFINET: Fault on drive %1, code %2, value %3, time %4****Parameters:** %1 = Axis

%2 = Fault code of drive (P947/I945)/P824)

%3 = Fault value of drive ((P949/P826)

%4 = Fault time of drive (P948/P825)

**Explanation:** Contents of fault memory of assigned drive.**Reaction:** Alarm display.**Remedy:** See drive documentation for fault codes/fault values.**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**380501 PROFIBUS/PROFINET: Fault on bus, slave/device, DO ID %1, code %2, value %3, time %4****Parameters:** %1 = 8 bit bus number, 8 bit slave/device number, 16 bit DO ID

%2 = Fault code of drive (P947)

%3 = Fault value of the drive (P949)

%4 = Fault time of the drive (P948)

**Explanation:** Contents of the fault memory of the assigned slave/device.**Reaction:** Alarm display.

**Remedy:** See drive documentation for fault codes/fault values.  
**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**380502 PROFIBUS/PROFINET: Bus %1, slave/device %2 configuration changed**

**Parameters:** %1 = Bus number  
%2 = Slave/device address

**Explanation:** The bus configuration has changed.  
Causes:  
- First commissioning  
- New slave/device recognized on the bus

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** In order to operate the bus with the new configuration, an additional restart will be required.  
**Programm continuation:** Switch control OFF - ON.

---

**380503 PROFIBUS/PROFINET: Bus %1 configuration changed**

**Parameters:** %1 = Bus number

**Explanation:** The PROFIBUS/PROFINET configuration has been changed.  
The new settings will not be activated until the next bus power up.

**Reaction:** Interface signals are set.  
Alarm display.

**Remedy:** In order to operate the bus with the new configuration, an additional restart will be required.  
**Programm continuation:** Switch control OFF - ON.

## PLC alarms

---

### 400000 PLC STOP %1

|                               |                                                                                                                                                                                                                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | PLC not in cyclic mode. Travel with the machine is not possible.<br>%1: 1 Ready (User program has not been started)<br>2 Break (User program has been interrupted)<br>3 Error (Other PLC alarm with PLC Stop active) |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                       |
| <b>Remedy:</b>                | Rectify other PLC alarm;<br>set PLC stop from Startup menu<br>or test user program.                                                                                                                                  |
| <b>Programm continuation:</b> | Alarm display showing cause of alarm disappears. No further operator action necessary.                                                                                                                               |

---

### 400001 System error (%1) %2

|                               |                                                                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | %1 : Error code (numerical)<br>%2 : Error text (optional error details)<br>This alarm is used to display internal error states which, in conjunction with the transferred error text, provide information about the cause and location of the error. |
| <b>Reaction:</b>              | PLC Stop                                                                                                                                                                                                                                             |
| <b>Remedy:</b>                | Notify Siemens of this error together with the error message.                                                                                                                                                                                        |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                                                                                             |

---

### 400002 System error %1

|                               |                                                                                                                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | %1 : Type number<br>Internal error states are displayed with this alarm. An error number is also specified to provide further details about the cause and location of the error. |
| <b>Reaction:</b>              | PLC Stop                                                                                                                                                                         |
| <b>Remedy:</b>                | Report this error to Siemens along with the type number.                                                                                                                         |
| <b>Programm continuation:</b> | Switch control OFF - ON.                                                                                                                                                         |

---

### 400003 System error, connection error to MCP: %1

|                               |                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Explanation:</b>           | %1 : Internal error code<br>This alarm reports a communication error to the MCP.<br>Code 1: Invalid sign-of-life value received (during operation)<br>Code 2: Sign-of-life failure of the MCP (during operation)<br>Code 3: No sign of life received by the MCP (run-up)<br>Code 4: General error<br>Code 5: MCP indicates error status during operation |
| <b>Reaction:</b>              | PLC Stop                                                                                                                                                                                                                                                                                                                                                 |
| <b>Remedy:</b>                | Check MCP connection.<br>If the error persists, please contact the hotline.                                                                                                                                                                                                                                                                              |
| <b>Programm continuation:</b> | Clear alarm with the Delete key or NC START.                                                                                                                                                                                                                                                                                                             |

---

**400004 Code error: %2 network %1**

**Explanation:** %1 : Network number  
%2 : Internal error code, module type  
The user program contains an operation which is not supported by the control.  
Type 1: Incorrect operand  
Type 2: Incorrect operation  
Type 3: Timer already used (TON or TONR)  
Type 4: User program too large - memory overflow  
Type 5: Excessive number of internal jump marks  
Type 6: Excessive number of global jump marks  
Type 7: Excessive number of SBRs  
Type 8: Link error, unresolved references

**Reaction:** PLC Stop

**Remedy:** Modify and reload user program.

**Programm continuation:** Switch control OFF - ON.

---

**400005 PLC stop specified from start-up menu**

**Explanation:** User program is not being processed

**Reaction:** Alarm display.

**Remedy:** Switch controller off/on

**Programm continuation:** Switch control OFF - ON.

---

**400006 Loss of remanent PLC data**

**Explanation:** The following causes are possible:  
Control handling (e.g. standard PLC deletion, power up with default values)  
Control handling of power up with backed up data without backing up data in advance  
Support time exceeded

**Reaction:** Alarm display.

**Remedy:** Update the data required.

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**400007 Operand error: %3 %2 network %1**

**Explanation:** %1 : Network number  
%2 : Block type, block number.  
%3 : Variable address

**Reaction:** PLC Stop

**Remedy:** The variable displayed must be checked in the user program for violation of the address range, impermissible data type and alignment errors.

**Programm continuation:** Switch control OFF - ON.

---

**400008 Programming tool - version is not compatible %1 %2**

**Explanation:** %1 : Programming tool version  
This version is not compatible with the product version of the control system.

**Reaction:** PLC Stop

**Remedy:** Translate the user program using a suitable programming tool version and load in the control.

**Programm  
continuation:** Switch control OFF - ON.

---

**400009 Computing time overrun at PLC level: %2 network %1**

**Explanation:** %1 : Network number  
%2 : Module type  
Check user program of the corresponding network displayed.

**Reaction:** PLC Stop

**Remedy:** Change user program

**Programm  
continuation:** Switch control OFF - ON.

---

**400010 Arithmetic error in user program: Type %2 network %1**

**Explanation:** Check user program in the specified network.  
%1 Network number, module ID  
%2 = 1: Division by zero using fixed-point arithmetic  
2: Floating-point arithmetic

**Reaction:** PLC Stop

**Remedy:** Change user program.

**Programm  
continuation:** Switch control OFF - ON.

---

**400011 Maximum number of subroutine levels exceeded: %2 network %1**

**Explanation:** %1 Network number  
%2 Module ID  
Check user program in the specified network.

**Reaction:** PLC Stop

**Remedy:** Change user program.

**Programm  
continuation:** Switch control OFF - ON.

---

**400012 Error affecting indirect addressing: %2, network %1**

**Explanation:** %1 Network number  
%2 Module ID  
Check user program in the specified network.

**Reaction:** PLC Stop

**Remedy:** Change user program.

**Programm  
continuation:** Switch control OFF - ON.

---

**400013 PLC user program is incorrect**

**Explanation:** The PLC user program in the control is incorrect or is not available.

**Reaction:** PLC Stop

**Remedy:** Reload PLC user program.

**Programm  
continuation:** Switch control OFF - ON.

---

**400014      PROFINET - I/O ramp-up fault type: %1**

**Explanation:**    %1:    1    PROFINET - I/O not ramped-up  
                      2    Software version NC - PLC incompatibility  
                      3    Number of slots per function exceeded  
                      4    PROFINET I/O server not ready

**Reaction:**        PLC Stop

**Remedy:**        Type 1:   Check PROFINET hardware and/or MD 12986, MD 11240 and MD 11241  
                      Types 2 to 3:   Report error to Siemens  
                      Type 4:   828D - Check and/or replace PCU hardware and/or check MD 11240 and MD 11241

**Programm continuation:**   Switch control OFF - ON.

---

**400015      PROFINET - IO I/O fault: log. addr. %1 bus/station: %2**

**Explanation:**    The PLC-UP is using I/O addresses which are not available.  
                      %1    Logical I/O address  
                      %2    Bus number/station number  
                      Causes of error:  
                      Bus I/O has no voltage  
                      Bus address set incorrectly  
                      Bus connection faulty  
                      PROFINET hardware defective

**Reaction:**        PLC Stop

**Remedy:**        Rectify the error using the error cause

**Programm continuation:**   Switch control OFF - ON.

---

**400017      PLC TOOLMAN: missing table in DB9900**

**Explanation:**    The PLC TOOLMAN cannot find one of the tables 9900, 9901 or 9902.

**Reaction:**        PLC Stop

**Remedy:**        Create the missing table(s).

**Programm continuation:**   Switch control OFF - ON.

---

**400018      PLC TOOLMAN: Spindle or load location invalid**

**Explanation:**    The PLC TOOLMAN does not know the specified spindle or load location number.

**Reaction:**        PLC Stop

**Remedy:**        Specify the correct number.

**Programm continuation:**   Switch control OFF - ON.

---

**400019      PLC maintenance planner: Error in DB 9903 or 9904**

**Explanation:**    PLC maintenance planner: DBs 9903 and 9904 must be present and must have the same length.

**Reaction:**        PLC Stop

**Remedy:**        Create block(s) correctly.

**Programm continuation:**   Switch control OFF - ON.

---

**400020 PLC maintenance request %1 : Initial data not plausible**

**Explanation:** Redefine the initial data in accordance with the documentation.  
 Error causes:  
 Too many alarms for the interval length  
 Time of first alarm too late  
 Time of first alarm greater than interval

**Reaction:** Alarm display.

**Remedy:** Specify correct initial data according to the documentation.

**Programm continuation:** Clear alarm with the Delete key or NC START.

**400021 Wait until I/O access is possible**

**Explanation:** I/O access is not possible at the current time.

**Reaction:** Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the Delete key or NC START.

**400022 The PLC functionality: %2 is not permitted.**

**Explanation:** PLC functionality: %2  
 The specified PLC functionality is not supported.

**Reaction:** Alarm display.

**Remedy:** You are not permitted to use the specified PLC functionality.

**Programm continuation:** Clear alarm with the Delete key or NC START.

**400023 Arithmetic problem in UP (REAL-Operation) OB/SBR/INT %1 Netzwerk %2**

**Explanation:** Problems with REAL operands during the PLC-UP execution  
 %1 Module No.  
 %2 Network No.

**Reaction:** Alarm display.

**Remedy:** The variables used have to be checked for valid values.

**Programm continuation:** Clear alarm with the Delete key or NC START.

**400024 Dynamically managed memory used up, area %1**

**Explanation:** Memory overflow in area corresponding to memory area identification  
 %1 = 1xx: dynamic RAM, xx refers to internal RAM class  
 %1 = 2: MMF (user project)  
 %1 = 3: buffered RAM  
 %1 = 4: UP-RAM

**Reaction:** Alarm display.

**Remedy:** With %1 = 1xx: Internal error due to too many external communications requirements  
 With %1 > 1: User project too large or too many operations

**Programm continuation:** Clear alarm with the Delete key or NC START.

**400025 PLC Ctrl Energy: Error in DB 9906**

**Explanation:** PLC Ctrl Energy: DB 9906 has been deleted.

**Reaction:** PLC Stop

**Remedy:** DB 9906 of the programming tool library must be incorporated into the project.  
**Programm continuation:** Switch control OFF - ON.

---

**400026 Alarm PLC cycle time, cycle time: %1 microseconds**

**Explanation:** PLC cycle time has exceeded the alarm threshold  
 %1 = xxxx: duration of the previous PLC cycle in µs  
**Reaction:** Alarm display.  
**Remedy:** User project is almost too large, too many operations or too many loops  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**400027 Error PLC cycle time, cycle time: %1 microseconds**

**Explanation:** PLC cycle time has exceeded the maximum value  
 %1 = xxxx: duration of the previous PLC cycle in µs  
**Reaction:** PLC Stop  
**Remedy:** User project too large, too many operations or too many loops  
**Programm continuation:** Switch control OFF - ON.

---

**400028 Option (%1) for additional LadderSteps not possible on this hardware**

**Explanation:** %1 = Option level  
 The PLC option for additional LadderSteps (32000 or more) cannot be implemented on this hardware.  
 The option must be reduced to a smaller level or reset completely  
 For up to 32000 LadderSteps (level 1), at least one PPU2xx.3 is required  
 For up to 100000 LadderSteps (level 2|3), at least one PPU2xx.4 is required  
**Reaction:** Alarm display.  
**Remedy:** PLC option cannot be implemented in this product variant  
**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**400029 Code warning %2 in the network %1**

**Explanation:** Too many branches in the network  
 %1 : Network number  
 %2 : Error code 13, block type  
**Reaction:** Alarm display.  
**Remedy:** Network contains too many branches; distribute logic better over a number of networks  
**Programm continuation:** Alarm display showing cause of alarm disappears. No further operator action necessary.

---

**400030 System error, USB machine control panel unsuitable**

**Explanation:** Connected USB machine control panel is not suitable for this CNC.  
**Reaction:** PLC Stop  
**Remedy:** Replace USB-MCP  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**400031 System error, the project is not compatible with NCK**

**Explanation:** This project has not been released for this machine.  
**Reaction:** PLC Stop

**Remedy:** Load original project.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**400032 System error, the project cannot run on this PLC version**

**Explanation:** The project comprises instructions which are not known in this PLC version  
**Reaction:** PLC Stop  
**Remedy:** Load original project.  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**400033 Permissible number of commands exceeded: %2 Network %1**

**Explanation:** Permissible number of commands exceeded  
 %1 : Network number  
 %2 : Current number of commands, block  
**Reaction:** PLC Stop  
**Remedy:** The user project comprises too many commands, shorten user project or activate the option number of commands  
**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**400034 Alarm %1 does not function. The data block DB9913 (ALARM\_INI) is not present.**

**Explanation:** Data block DB9913 together with the configuration of the alarm reaction, cancel criterion and channel assignment are not included in the user project.  
 %1 : Alarm number of the activated alarm  
**Reaction:** Alarm display.  
**Remedy:** In the PLC programming tool, the special data block DB9913 must be copied from "Libraries" into the project. Alarm reaction, cancel criterion and channel assignment must be specified accordingly. The project must be loaded into the PLC.  
**Programm continuation:** Switch control OFF - ON.

---

**400035 Activation of the infeed via PLC data block, configuration error type %1**

**Explanation:** The infeed cannot be activated because of a configuration error.  
 Type 1: Data block DB9914 not included in user project  
 Type 2: Settings of the ALM machine data do not match the SDB configuration  
**Reaction:** Alarm display.  
**Remedy:** Type 1: Insert data block DB9914 into user project  
 Type 2: Check ALM machine data and SDB configuration  
**Programm continuation:** Switch control OFF - ON.

---

**400036 USB MCP access conflict in the I/O image: log addr. %1 Bus/station/type: %2**

**Explanation:** The memory area intended for the USB MCP is already being used by another device.  
 %1 Logical I/O address  
 %2 Bus number/station number/type  
 Type 0: Address conflict with the inputs.  
 Type 1: Address conflict with the outputs.  
 Causes of error:  
 Incorrect configuration of the I/O in MD12986  
 Erroneous "Enable I/O addressing activated for USB MCP" (MD19720, bit\_1)  
 Incorrect configuration of the I/O in MD12950 (USB MCP address)  
**Reaction:** PLC Stop

**Remedy:** Check machine data setting MD12950, MD12951, MD12952, MD12986, MD12987, MD19720.1  
**Programm  
continuation:** Switch control OFF - ON.

---

**400037      USB MCP - invalid configuration in MD19720**

**Explanation:** Mutually exclusive settings are active in the stated machine data (MD19720).  
Causes of error:  
Bit\_1 and bit\_0 are set simultaneously.  
If a USB MCP is used, only one of the two bits may be set.  
(If no USB MCP is configured, then bit\_1 is not evaluated)

**Reaction:** PLC Stop

**Remedy:** Correct the setting in machine data (MD19720) or remove USB MCP from the configuration (MD12950)

**Programm  
continuation:** Switch control OFF - ON.

## System responses

### 10.1 System reactions to SINUMERIK alarms

| Response                             | Effect                                                                                                                                                                                                                                                    |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Correction block with reorganization | Block preparation has detected an error, which can be corrected by modifying the program. Reorganization is performed after a program modification.                                                                                                       |
| Correction block                     | Block preparation has detected an error, which can be corrected by modifying the program.                                                                                                                                                                 |
| NC switches into the tracking mode   | The axes follow-up.                                                                                                                                                                                                                                       |
| Interpreter stop                     | Program execution is canceled after all the prepared blocks (IPO buffer) have been processed.                                                                                                                                                             |
| Local alarm response                 | A local alarm response is output.<br>In the program code, individual actions can be executed, which are checked using this response. For example, the block sequence is interrupted in preprocessing if a compile cycle alarm appears with this response. |
| No alarm response                    | No alarm response is initiated.                                                                                                                                                                                                                           |
| NC not ready                         | NC ready is not set:<br>Active fast braking (i.e. with the maximum braking current) for all drives.<br>The controller enable for all NC axes is deleted.<br>NC ready relay contact drops out.                                                             |
| Mode group not ready                 | Mode group ready is not set:<br>Active fast braking (i.e. with the maximum braking current) is realized for all drives of this mode group.<br>The controller enable of the NC axes involved is deleted.                                                   |
| Channel not ready                    | Channel ready is not set:<br>Active fast braking (i.e. with the maximum braking current) is realized for all drives of this channel.<br>The controller enable of the NC axes involved is deleted.                                                         |
| NC start inhibit in this channel     | A program cannot be started in this channel.                                                                                                                                                                                                              |
| Re-reference axes in this channel    | The axes in this channel have to be referenced again.                                                                                                                                                                                                     |
| Interface signals are set            | A VDI interface signal alarm is set.                                                                                                                                                                                                                      |
| Alarm display                        | The alarm is displayed at the user interface.                                                                                                                                                                                                             |
| NC stop for alarm                    | All channel are stopped using a ramp stop.                                                                                                                                                                                                                |
| NC Stop for an alarm at end of block | NC stops if the end of a block is reached.                                                                                                                                                                                                                |
| Alarm reaction in automatic mode     | The alarm is displayed whenever bit 0 of machine data MD11411 \$MN_ENABLE_ALARM_MASK is set.<br>The response is be set whenever an alarm should only occur during automatic mode without manual operation by a user.                                      |
| Message display                      | The alarm is displayed when bit 1 of machine data MD11411 \$MN_ENABLE_ALARM_MASK is set.<br>The message display is for alarms that are normally suppressed.                                                                                               |

## 10.1 System reactions to SINUMERIK alarms

| Response                                                                     | Effect                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mode group is not ready, is also effective on individual axes                | <p>The NC ready is canceled in all mode groups.</p> <p>As a consequence, the response corresponds to an "NC not ready" with the following difference:</p> <p>The "NC ready" is not withdrawn and the corresponding VDI bit is not set, e.g. for Emergency Stop.</p>                                                                                                                                                                              |
| All channel-specific alarm reactions delayed on alarm, alarm display         | <p>All responses are buffered on a channel-for-channel-specific basis from the incoming alarms and are therefore not active.</p> <p>The alarms are displayed at the user interface.</p> <p>The responses from the mode group and NC are transferred.</p> <p>The delayed alarm responses are activated if the responses are deleted by an activated internal NC code, or by the configured alarm response "Alarm response delay is canceled".</p> |
| All alarm responses are delayed by one IPO cycle on alarm                    | All alarm responses are delayed by one cycle when an alarm is issued. This functionality is required as part of ESR development.                                                                                                                                                                                                                                                                                                                 |
| The alarm response delay is canceled                                         | The state of "All channel-specific alarm responses delayed on alarm, alarm display" is canceled.                                                                                                                                                                                                                                                                                                                                                 |
| NC start inhibit in this channel, ASUB starts, where relevant, are permitted | A program cannot be started in this channel. ASUBs, where relevant, are permitted.                                                                                                                                                                                                                                                                                                                                                               |

## 10.2 Cancel criteria for alarms

| Cancel criteria                                                                                                 | Effect                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Clear the alarm with the Clear key or with NC start.                                                            | The alarm is cleared in any channel by pressing the <ALARM CANCEL> key.<br>In addition, the alarm is cleared by pressing the <CYCLE START> or <RESET> key.           |
| The alarm is no longer displayed when the alarm cause has been removed. No other operator actions are required. | Self-clearing alarm.<br>The alarm is not cleared by an operator action, but explicitly by an activated internal NC code.                                             |
| Clear the alarm with NC start or RESET key and continue the program.                                            | The alarm is cleared by pressing the <CYCLE START> key in the channel in which the alarm occurred.<br>In addition, the alarm is cleared by pressing the <RESET> key. |
| Switch the control OFF - ON.                                                                                    | The alarm is canceled by switching off the control and switching it on again.                                                                                        |
| Clear the alarm with the RESET key. Restart the part program.                                                   | The alarm is cleared by pressing the <RESET> key in the channel in which the alarm occurred.<br>Then restart the part program.                                       |
| Press the RESET key to clear the alarm in all channels of this mode group. Restart the part program.            | The alarm is cleared in the channels, in which the mode group alarm has occurred, by pressing the <RESET> key.<br>Then restart the part program.                     |
| Clear alarm in all channels with the RESET key. Restart the part program.                                       | The alarm is cleared in the channels by pressing the <RESET> key.<br>Then restart the part program.                                                                  |

## 10.3 System reactions for SINAMICS alarms

### Fault responses

The fault reactions used and their meanings are described below:

|             |                                  |
|-------------|----------------------------------|
| Designation | NONE                             |
| Response    | None                             |
| Description | No reaction when a fault occurs. |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Response    | Internal/external pulse disable (p0491)                                                                                                                                                                                                                                                                     |
| Description | <p>The fault reaction ENCODER is applied as a function of the setting in p0491.</p> <p>Factory setting:<br/>p0491 = 0 → Encoder fault causes OFF2</p> <p><b>Please note:</b><br/>When changing p0491, it is imperative that the information in the description of this parameter is carefully observed.</p> |

## Acknowledge faults

Specifies the default method of acknowledging faults after the cause has been removed.

|             |                                                                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Designation | POWER ON                                                                                                                                                                                                              |
| Description | The fault is acknowledged by a POWER ON process (switch drive unit off and on again).<br><b>Note:</b><br>If the fault cause has still not been resolved, then the fault is immediately displayed again after booting. |

|             |                                                                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Designation | PULSE DISABLE                                                                                                                                                                 |
| Description | The fault can only be acknowledged with a pulse disable (r0899.11 = 0).<br>The same options are available for acknowledging as described under acknowledgment with IMMEDIATE. |

## Reference to SINAMICS parameters

In some fields, reference is made to a SINAMICS parameter for the alarms.

The parameter number consists of the letter "p" or "r" as prefix, followed by a 4-digit number (xxxx), and optionally an index, e.g. p0918[0...3].

## References

A detailed description of the SINAMICS parameters is provided in the:

## SINAMICS S120/S150 List Manual

## Stop conditions

%3 = Channel axis identifier  
%4 = Channel axis identifier

**Reaction:** stop

---

**74 Jog: Direction disabled %2 %3 %4**

**Parameters:** %2 = Channel axis identifier  
%3 = Channel axis identifier  
%4 = Channel axis identifier

**Reaction:** stop

---

**75 Context sensitive stop request %2 %3 %4**

**Parameters:** %2 = Channel axis identifier  
%3 = Channel axis identifier  
%4 = Channel axis identifier  
%7 = Braking priority with sign for the direction of the motion command

**Reaction:** wait

---

**76 Wait: G4 S%1 still: %2 U**

**Parameters:** %1 = Programmed dwell time in revolutions  
%2 = Remaining revolutions

**Reaction:** wait

---

**77 Axial feed disable from PLC %2 %3 %4**

**Parameters:** %2 = Channel axis identifier  
%3 = Channel axis identifier  
%4 = Channel axis identifier

**Reaction:** stop

---

**78 Waiting for axial feedrate enable**

**Reaction:** stop

---

**79 Axial feed disable from Synact %2 %3 %4**

**Parameters:** %2 = Channel axis identifier  
%3 = Channel axis identifier  
%4 = Channel axis identifier

**Reaction:** wait

---

**80 Wait for speed of master spindle %1**

**Parameters:** %1 = Channel axis identifier

**Reaction:** wait

---

**81 Wait for parameter set change %2 %3 %4**

**Parameters:** %2 = Channel axis identifier  
%3 = Channel axis identifier  
%4 = Channel axis identifier

**Reaction:** wait

---

---

**82 Wait for axis before transformer change %2 %3 %4**

**Parameters:** %2 = Channel axis identifier  
%3 = Channel axis identifier  
%4 = Channel axis identifier

**Reaction:** wait

---

**83 Waiting for cutting calculation**

**Parameters:** %1 = Progress display

**Reaction:** wait

---

**84 Wait for measuring system axis %2 %3 %4**

**Parameters:** %2 = Channel axis identifier  
%3 = Channel axis identifier  
%4 = Channel axis identifier

**Reaction:** wait

---

**85 Override limited: %1**

**Parameters:** %1 = Feedrate override value

**Reaction:** wait

---

**86 Wait for MMC command**

**Reaction:** wait

---

**87 Overlap not released %2 %3 %4**

**Reaction:** wait

---

**88 Waiting for drive parameter of %2**

**Parameters:** %2 = Part program command "ESRR" or "ESRS"

**Reaction:** wait

---

**89 Waiting for external device %2**

**Parameters:** %2 = Programmed identifier of the external device"

**Reaction:** wait

---

**90 Wait for end of program in the channel %3 %4 %5**

**Parameters:** %3 = Channel identifier  
%4 = Channel identifier  
%5 = Channel identifier

**Reaction:** wait

---

**91 Wait for interpolation buffer**

**Reaction:** wait

---

**92 Configured stop CST G0->G0**

**Reaction:** stop

---

**93 Configured stop CST G0->G1**

**Reaction:** stop

---

## Stop conditions

## A.1 List of abbreviations

| Abbreviation | Derivation of the abbreviation                     | Meaning                                                  |
|--------------|----------------------------------------------------|----------------------------------------------------------|
| AC           | Adaptive Control                                   |                                                          |
| ALM          | Active Line Module                                 | Infeed module for drives                                 |
| AP           | User program                                       |                                                          |
| AS           | Automation system                                  |                                                          |
| ASCII        | American Standard Code for Information Interchange | American coding standard for the exchange of information |
| ASIC         | Application Specific Integrated Circuit            | User switching circuit                                   |
| ASUP         | Asynchronous subprogram                            |                                                          |
| AUTO         |                                                    | Operating mode "Automatic"                               |
| AUXFU        | Auxiliary Function                                 | Auxiliary functions                                      |
| STL          | Statement list                                     |                                                          |
| BA           | Operating mode                                     |                                                          |
| Mode group   | Mode group                                         |                                                          |
| BERO         | Proximity limit switch with feedback oscillator    |                                                          |
| BI           | Binector Input                                     |                                                          |
| HHU          | Handheld unit                                      |                                                          |
| BICO         | Binector Connector                                 | Interconnection technology for the drive                 |
| BIN          | Binary Files                                       | Binary files                                             |
| BIOS         | Basic Input Output System                          |                                                          |
| BCS          | Basic coordinate system                            |                                                          |
| SSM          | System status message                              | In connection with PLC messages                          |
| BO           | Binector Output                                    |                                                          |
| OPI          | Operator Panel Interface                           |                                                          |
| CAD          | Computer-Aided Design                              |                                                          |
| CAM          | Computer-Aided Manufacturing                       |                                                          |
| CC           | Compile Cycle                                      | Compile cycles                                           |
| CI           | Connector Input                                    |                                                          |
| CF-Card      | Compact Flash-Card                                 |                                                          |
| CNC          | Computerized Numerical Control                     | Computerized numerical control                           |
| CO           | Connector Output                                   |                                                          |
| COM Board    | Communication Board                                |                                                          |
| CP           | Communication Processor                            |                                                          |
| CPU          | Central Processing Unit                            | Central processing unit                                  |
| CR           | Carriage Return                                    |                                                          |
| CRC          | Cyclic Redundancy Check                            | Checksum test                                            |
| CRT          | Cathode Ray Tube                                   | Picture tube                                             |

| Abbreviation | Derivation of the abbreviation                     | Meaning                                                                        |
|--------------|----------------------------------------------------|--------------------------------------------------------------------------------|
| CSB          | Central Service Board                              | PLC module                                                                     |
| CTS          | Clear To Send                                      | Signals that data is ready to be sent for serial data interfaces               |
| CUTCOM       | Cutter Radius Compensation                         | Tool radius compensation                                                       |
| DB           | Data block                                         | Data block in the PLC                                                          |
| DBB          | Data-block byte                                    | Data block-byte in the PLC                                                     |
| DBW          | Data-block word                                    | Data-block word in the PLC                                                     |
| DBX          | Data-block bit                                     | Data-block bit in the PLC                                                      |
| DDE          | Dynamic Data Exchange                              | Dynamic data exchange                                                          |
| DDS          | Drive Data Set                                     | Drive data set                                                                 |
| DIN          | Deutsche Industrie Norm (German Industry Standard) |                                                                                |
| DIR          | Directory                                          | Directory                                                                      |
| DLL          | Dynamic Link Library                               |                                                                                |
| DO           | Drive Object                                       | Drive object                                                                   |
| DPM          | Dual Port Memory                                   |                                                                                |
| DRAM         | Dynamic Random Access Memory                       | Dynamic memory block                                                           |
| DRF          | Differential Resolver Function                     | Differential resolver function (handwheel)                                     |
| DRIVE-CLiQ   | Drive Component Link with IQ                       |                                                                                |
| DRY          | Dry Run                                            | DRY run feedrate                                                               |
| DSB          | Decoding Single Block                              | Decoding single block                                                          |
| DSC          | Dynamic Servo Control / Dynamic Stiffness Control  |                                                                                |
| DSR          | Data Send Ready                                    | Signals the availability of serial data interfaces                             |
| DW           | Data word                                          |                                                                                |
| DWORD        | Double word (currently 32 bits)                    |                                                                                |
| I            | Input                                              |                                                                                |
| I/O          | Input/Output                                       |                                                                                |
| ENC          | Encoder                                            | Actual value encoder                                                           |
| EPROM        | Erasable Programmable Read Only Memory             | Erasable, electronically programmable read-only memory                         |
