---

**61626 [Channel %1: ] Block %2: With the programmed angular values, the tool tip is not located in the turning plane %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Angular values were programmed where the tool tip is not located in the turning plane.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Program suitable angular values or use the programming based on "Beta" and "Gamma".

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61627 [Channel %1: ] Block %2: Rotation of the turning tool not possible as the tool holder for turning tools is fixed.**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Rotation of the turning tool not possible as the tool holder for turning tools is fixed.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select Use "fixed"

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61628 [Channel %1: ] Block %2: Swivel plane not possible %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Swivel plane is not possible

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** \$TC\_DPV[n,m]<>0 : A tool with the specified orientation must be defined for the CYCLE800 by the orientation vectors \$TC\_DPV3,\$TC\_DPV4 and \$TC\_DPV5. A definition by \$TC\_DPV only is not supported by CYCLE800. For a definition by means of vectors, MD 18114 \$MN\_MM\_ENABLE\_TOOL\_ORIENT must = 2.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61695 %[[Channel %1: ] Block %2: %]Parameter R123 incorrectly programmed**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** - Check parameter R123

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61696      %[[Channel %1: ] Block %2: %]Parameter R122 too high**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check parameter R122

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61697      %[[Channel %1: ] Block %2: %]Parameter R122 too low**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check parameter R122

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61698      %[[Channel %1: ] Block %2: %]Parameter R122 has incorrect sign**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check parameter R122

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61699      %[[Channel %1: ] Block %2: %]Parameter R121 has incorrect sign**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check parameter R121

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61700      %[[Channel %1: ] Block %2: %]Name of program to be generated is missing**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check parameter PRG

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61701      %[[Channel %1: ] Block %2: %]Contour %4 does not exist**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check parameter CON  
                     - Check contour call  
                     - Check whether the contours exist in the program storage (workpieces, subroutines or part programs)

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61702      %[[Channel %1: ] Block %2: %]Label %4 not existing in machined part contour**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check whether the labels exist in the machined part contour

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61703      %[[Channel %1: ] Block %2: %]Label %4 not existing in the blank contour**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check whether the labels exist in the blank contour

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61704      %[[Channel %1: ] Block %2: %]Machined part contour missing**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check contour call (CYCLE62)

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61705      %[[Channel %1: ] Block %2: %]Blank contour missing**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check contour call

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61706      %[[Channel %1: ] Block %2: %]Error in machined part contour %4**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check programming of machined part contour

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61707      %[[Channel %1: ] Block %2: %]Error in the blank contour %4**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check programming of the blank contour

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

---

**61708      %[[Channel %1: ] Block %2: %]Too many contours specified**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check number of contours  
                     - Max. two contours (machined part and blank contours)  
                     - Min. one contour (machined part contour)

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

**61709      %[[Channel %1: ] Block %2: %]Cutting edge radius too small**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check cutting edge radius of the tool in tool management

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

**61710      %[[Channel %1: ] Block %2: %]Calculation has been canceled**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Calculation has been canceled by PI service; please try again

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

**61711      %[[Channel %1: ] Block %2: %]Infeed D is larger than the tip width of the tool**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check infeed D in connection with the tip width of the tool in tool management.

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

---

**61712      %[[Channel %1: ] Block %2: %]Infeed DX or DZ is larger than tip length of tool**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**          - Check infeed DX or DZ in connection with tip length of the tool in tool management.

**Programm  
 continuation:**    Clear alarm with the RESET key. Restart part program

---

**61713      %[[Channel %1: ] Block %2: %]Tool radius larger than half the tip width**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**          - Check tool radius and tip width of tool (plunge cutter, cutting tool)

**Programm  
 continuation:**    Clear alarm with the RESET key. Restart part program

---

**61714      %[[Channel %1: ] Block %2: %]Error during contour turning %4**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**    -103: Machining not possible  
                      -121: Cancellation due to lack of memory

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**          -103: Check contour or the position of the tool does not match the contour  
                      -121: Check contour and technological data  
                      Call the SIEMENS hotline

**Programm  
 continuation:**    Clear alarm with the RESET key. Restart part program

---

**61730      %[[Channel %1: ] Block %2: %]Machining range outside delimitation**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**          - Check machining range and delimitation

**Programm  
 continuation:**    Clear alarm with the RESET key. Restart part program

---

---

**61731      %[[Channel %1: ] Block %2: %]Unable to determine contour direction**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check contours  
                     - Check whether the contour starting point exists

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61732      %[[Channel %1: ] Block %2: %]No material available for machining**

---

**61739      %[[Channel %1: ] Block %2: %]Blank must be closed contour**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check whether the blank contour is closed

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61740      %[[Channel %1: ] Block %2: %]Collision through approach**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Select the starting position to enable collision-free approach of the contour

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61741      %[[Channel %1: ] Block %2: %]Axis in negative range**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check the position of the axis in the ordinate

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61742      %[[Channel %1: ] Block %2: %]Retraction plane %4 is within the machining range**

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            For internal machining, check the machining range in relation to the entered retraction distance (SD 55506 \$SCS\_TURN\_ROUGH\_I\_RELEASE\_DIST).

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

---

**61743      %[[channel %1: ] block %2: %]Guide channel for two-channel cutting missing**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check if a guide channel has been defined

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

**61744      %[[channel %1: ] block %2: %]Following channel for two-channel cutting missing**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check if a following channel has been defined

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

**61745      %[[channel %1: ] block %2: %]Two-channel cutting in two guide channels (%4) active**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check if two guide channels are active  
                          - Check if two-channel cutting is active simultaneously in more than two channels  
                          - Two channels only may be active: a guide and a following channel

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

**61746      %[[channel %1: ] block %2: %]Two-channel cutting active already in the channels (%4)**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check if two-channel cutting is active simultaneously in more than two channels.  
                          - Two channels only may be active simultaneously: a guide and a following channel.

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

---

**61747**      %[[channel %1: ] block %2: %]Incorrect guide channel for two-channel cutting (%4)

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Check if the program of the guide channel runs in the channel selected via the program of the following channel in parameter partner channel.

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

**61748**      %[[channel %1: ] block %2: %]Machining plane different in guide and following channel

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Machining plane must be the same in guide and following channel.

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

**61749**      %[[channel %1: ] block %2: %]Technology different in guide and following channel

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Technology (cutting / residual, plunge-cutting / residual, plunge-turning / residual) must be the same in guide and following channel.

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

---

**61750**      %[[channel %1: ] block %2: %]Machining different in guide and following channel

**Parameters:**      %1 = Channel number  
                     %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                     NC Start disable in this channel.  
                     Interface signals are set.  
                     Alarm display.

**Remedy:**            - Machining (rough cutting / finish cutting) must not be different in guide and following channel.

**Programm continuation:**      Clear alarm with the RESET key. Restart part program

| <b>Remedy:</b>                | --                                                                                                                                                                                                                                                                                                                                                                                                 |

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61803 [Channel %1: ] Block %2: Programmed axis not available**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The programmed axis is not in the system.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check parameter \_AXN.  
Check machine data 20050 to 20080.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61804 [Channel %1: ] Block %2: Progr. position exceeds reference point**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The programmed intermediate position or actual position is behind the reference point.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61805 [Channel %1: ] Block %2: Value programmed absolute and incremental**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The programmed intermediate position is both absolutely as well as incrementally programmed.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61806 [Channel %1: ] Block %2: Wrong axis assignment**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The axis-assignment sequence is wrong.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61807 [Channel %1: ] Block %2: Wrong spindle direction programmed (active)**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The programmed spindle direction contradicts the spindle direction planned for the cycle.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check parameters SDR and SDAC.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61808 [Channel %1: ] Block %2: Final drilling depth or single drilling depth missing**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The total depth Z or individual drilling depth Q is missing from the G8xblock (initial cycle call).

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61809 [Channel %1: ] Block %2: Drill position not permissible**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** --

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61810 [Channel %1: ] Block %2: ISO G code not possible**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** In the call block an impermissible ISO axis name was programmed.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61811 [Channel %1: ] Block %2: ISO axis name illegal**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** In the call block an impermissible numerical value was programmed.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61812 [Channel %1: ] Block %2: Value(s) in external cycle call wrongly defined**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** In the call block an impermissible numerical value was programmed.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61813 [Channel %1: ] Block %2: GUD value wrongly defined**

**Explanation:** An impermissible numerical value was entered in the cycles-setting data.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61814 [Channel %1: ] Block %2: Polar coordinates not possible with cycle**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** --

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** --

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61815 [Channel %1: ] Block %2: G40 not active**

**Parameters:** %1 = Channel number  
%2 = Block number

---

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|

|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                       |
| <b>Explanation:</b>           | Check the data format of the program.                                                                 |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Correct data format.                                                                                  |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61839 [Channel %1: ] Block %2: Application does not run**

|                     |                                                 |
|---------------------|-------------------------------------------------|
| <b>Parameters:</b>  | %1 = Channel number<br>%2 = Block number, label |
| <b>Explanation:</b> | Ensure that the application runs.               |

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                | Restart part program.                                                                                 |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61840 [Channel %1: ] Block %2: Error on execution of automatic servo tuning**

|                               |                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Acknowledgment mode<br>%4 = MMC sequence number |
| <b>Explanation:</b>           |                                                                                                         |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.   |
| <b>Remedy:</b>                |                                                                                                         |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                    |

---

**61841 [Channel %1: ] Block %2: Necessary GUD for automatic servo tuning is missing: %3**

|                               |                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Missing GUD                                   |
| <b>Explanation:</b>           |                                                                                                       |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display. |
| <b>Remedy:</b>                |                                                                                                       |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                  |

---

**61842 [Channel %1: ] Block %2: Calling a cycle of the automatic servo tuning is not permissible: %3**

|                               |                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label<br>%3 = Caller                                                         |
| <b>Explanation:</b>           | Calling CYCLE75x is not permissible because it is called by a cycle from the standard or manufacturer cycle directory. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                  |
| <b>Remedy:</b>                | You need the manufacturer password to call CYCLE75x.                                                                   |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                   |

---

**61850 [channel %1: ] block %2: cylinder surface transformation not released**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Cylinder surface transformation not released for ShopMill.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61851 [channel %1: ] block %2: no suitable transformation set up: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The required transformation is not set up on this machine.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61852 [channel %1: ] block %2: transformation not set up for this plane: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Transformation not set up for the plane used. Change plane.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61853 [channel %1: ] block %2: incorrect plane for machining with rotary axis: %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Machining cannot be executed on the rotary axis of the current plane. Change plane.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61854 [Channel %1: ] Block %2: Subprogram level too low for block search**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The subprogram level is too low for block search.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Execute block search with another block.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61855 [Channel %1: ] Block %2: Target point lies in the retraction area**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The specified target point lies in the retraction area.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Change target point or retraction area.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61856 [Channel %1: ] Block %2: Absolute input of the work offset values not enabled**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The absolute input of the work offset value has not been enabled.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** 52212 \$MCS\_FUNCTION\_MASK\_Tech Bit 6: work offset value WO cannot be entered as absolute value (ShopTurn).

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61857 [Channel %1: ] Block %2: No rotary axis to accept a blank has been set up**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** No rotary axis to accept a blank has been set up.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check machine data 52207 \$MCS\_AXIS\_USAGE\_ATTRIB Bit 8.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61858 [Channel %1: ] Block %2: Turning is only possible with a blank that is clamped, centered**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Turning is only possible with a blank that is clamped, centered.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Use a blank that is clamped so that it is centered.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61859 [Channel %1: ] Block %2: Turning has not been enabled**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Turning has not been set up on the machine.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check machine data: 52201 \$MCS\_TECHNOLOGY\_EXTENSION=1 (turning).

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61860 [Channel %1: ] Block %2: Turning only possible on a main spindle**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** For turning, a main spindle was not selected for clamping.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select a main spindle as clamping for turning.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61861 [Channel %1: ] Block %2: Tailstock not selected in this channel**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The tailstock was selected in another channel, but not in this channel.  
The different selection/deselection results in a conflict.  
When the tailstock is selected, it is not permissible that the counterspindle is positioned.  
However, when the tailstock is deselected, the counterspindle should be positioned.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Select or deselect the tailstock consistently in all channels.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                              |
| <b>Explanation:</b>           | It is not permissible that a ShopMill cycle is used outside a ShopMill program, as the required environment variables are otherwise not assigned.                                                                            |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                        |
| <b>Remedy:</b>                | Calling a ShopMill cycle in a ShopMill program. If this is not possible, then the task must be programmed using G code.                                                                                                      |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                         |
| <hr/>                         |                                                                                                                                                                                                                              |
| <b>61867</b>                  | <b>[Channel %1: ] Block %2: On face C, the retraction distance must not be larger than the distance to the center point.</b>                                                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                              |
| <b>Explanation:</b>           | Retraction distance too large. On face C, the retraction distance must not be larger than the distance to the center point. Otherwise, retraction would become negative, which would lead to a reversal of the work spindle. |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                        |
| <b>Remedy:</b>                | Use a smaller retraction distance or face Y if possible.                                                                                                                                                                     |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                         |
| <hr/>                         |                                                                                                                                                                                                                              |
| <b>61868</b>                  | <b>[Channel %1: ] Block %2: Program was created on another machine and must be adjusted.</b>                                                                                                                                 |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                              |
| <b>Explanation:</b>           | The program was created on another machine and contains program parts that can not be executed on this machine.                                                                                                              |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                        |
| <b>Remedy:</b>                | The program must be adjusted in the ShopMill/ShopTurn editor.                                                                                                                                                                |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                         |
| <hr/>                         |                                                                                                                                                                                                                              |
| <b>61869</b>                  | <b>[Channel %1: ] Block %2: Block search is only possible with calculation</b>                                                                                                                                               |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                              |
| <b>Explanation:</b>           | With ShopMill and ShopTurn, block search is only possible with calculation.                                                                                                                                                  |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                        |
| <b>Remedy:</b>                | Use a different block search mode.                                                                                                                                                                                           |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                         |

**61870 [Channel %1: ] Block %2: Danger of collision during automatic retraction. Retract tool manually!**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** There is a danger of collision during automatic retraction.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Retract tool manually!

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61900 %[[Channel %1: ] Block %2: %]Name of program to be generated is missing**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** - Check parameter PRG

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61901 %[[Channel %1: ] Block %2: %]Contour %4 does not exist**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** - Check contour call  
- Check whether the contours exist in the program storage (workpieces, subroutines or part programs)

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61902 %[[Channel %1: ] Block %2: %]Label %4 not existing in the pocket contour**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** - Check whether the labels exist in the pocket contour

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

---

**61903      %[[Channel %1: ] Block %2: %]Label %4 not existing in the blank contour**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check whether the labels exist in the blank contour

**Programm  
 continuation:**      Clear alarm with the RESET key. Restart part program

---

**61904      %[[Channel %1: ] Block %2: %]Label %4 not existing in the island contour**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check whether the labels exist in the island contour

**Programm  
 continuation:**      Clear alarm with the RESET key. Restart part program

---

**61905      %[[Channel %1: ] Block %2: %]Label %4 not existing in the spigot contour**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check whether the labels exist in the spigot contour

**Programm  
 continuation:**      Clear alarm with the RESET key. Restart part program

---

**61906      %[[Channel %1: ] Block %2: %]Label %4 not existing in the contour**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check whether the labels exist in the contour

**Programm  
 continuation:**      Clear alarm with the RESET key. Restart part program

---

---

**61907      %[[Channel %1: ] Block %2: %]Pocket contour missing**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check contour call

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61908      %[[Channel %1: ] Block %2: %]Blank contour missing**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check contour call

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61909      %[[Channel %1: ] Block %2: %]Error in pocket contour %4**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check programming of the pocket contour

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61910      %[[Channel %1: ] Block %2: %]Error in the blank contour %4**

**Parameters:**      %1 = Channel number  
                          %2 = Block number, label

**Explanation:**

**Reaction:**            Interpreter stop  
                          NC Start disable in this channel.  
                          Interface signals are set.  
                          Alarm display.

**Remedy:**            - Check programming of the blank contour

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

---

**61911**      %[[Channel %1: ] Block %2: %]Error in island contour %4

**Parameters:**    %1 = Channel number  
                  %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                  NC Start disable in this channel.  
                  Interface signals are set.  
                  Alarm display.

**Remedy:**          - Check programming of the island contour  
                  - Check whether the island contour is closed  
                  - Check the contour for self-cuts

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61912**      %[[Channel %1: ] Block %2: %]Error in spigot contour %4

**Parameters:**    %1 = Channel number  
                  %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                  NC Start disable in this channel.  
                  Interface signals are set.  
                  Alarm display.

**Remedy:**          - Check programming of the spigot contour

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61913**      %[[Channel %1: ] Block %2: %]Error in contour %4

**Parameters:**    %1 = Channel number  
                  %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                  NC Start disable in this channel.  
                  Interface signals are set.  
                  Alarm display.

**Remedy:**          - Check programming of the contour

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

---

**61914**      %[[Channel %1: ] Block %2: %]Too many contours specified

**Parameters:**    %1 = Channel number  
                  %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                  NC Start disable in this channel.  
                  Interface signals are set.  
                  Alarm display.

**Remedy:**          - Check the number of contours

**Programm continuation:**    Clear alarm with the RESET key. Restart part program

| <b>Remedy:</b>                | - Check cutter radius for residual machining which must be smaller than cutter radius for reference tool !        |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                              |

---

**61919      %[[Channel %1: ] block %2: %]Radius of the reference tool is too small**

**Parameters:**      %1 = Channel number  
                      %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**            - Check the radius of the reference tool.

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61920      %[[Channel %1: ] Block %2: %]Error during contour milling %4**

**Parameters:**      %1 = Channel number  
                      %2 = Block number, label

**Explanation:**      3020: No more memory is available  
                      3022: The contour is incorrect  
                      3023: Check contour (contour may contain too small elements)  
                      3356: The residual material cannot be removed completely with the tool used.

**Reaction:**          Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**            3020, 3022, and 3023: Check contour and technological data  
                      3356: A tool with a smaller diameter, with which the residual material can be removed completely, must be used for residual machining.  
                      Call the SIEMENS hotline

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61921      %[[Channel %1: ] Block %2: %]Error during groove milling %4**

**Parameters:**      %1 = Channel number  
                      %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:**

**Programm  
continuation:**    Clear alarm with the RESET key. Restart part program

---

**61922      %[[Channel %1: ] Block %2: %]Label %4 not present in the groove contour**

**Parameters:**      %1 = Channel number  
                      %2 = Block number, label

**Explanation:**

**Reaction:**          Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:** - Check whether the labels are present in the groove contour

**Programm continuation:** Clear alarm with the RESET key. Restart part program

#### **61923      %[[Channel %1: ] Block %2: %]Error in the groove contour %4**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** - Check the programming of the groove contour

**Programm continuation:** Clear alarm with the RESET key. Restart part program

#### **61924      %[[Channel %1: ] Block %2: %]Groove contour missing**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** - Check contour call

**Programm continuation:** Clear alarm with the RESET key. Restart part program

#### **61925      %[[Channel %1: ] Block %2: %]Communication failure between cycle and application**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Local variables that are used for communication between cycle and spiral algorithm could not be read.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check the cycle and app versions, they must be identical.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

#### **61926      %[[Channel %1: ] Block %2: %]Program %4 could not be copied**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Local variables that are used for communication between cycle and spiral algorithm could not be read.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check the cycle and app versions, they must be identical.  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61927**      %[[Channel %1: ] Block %2: %]Corner radius %4 too small

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The minimum corner radius is too small.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Increase the corner radius or use a smaller tool.  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61928**      %[[Channel %1: ] Block %2: %]First contour element too short for corner radius %4

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The first contour element is too short for the corner radius.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Lengthen the contour element or reduce the corner radius.  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61929**      %[[Channel %1: ] Block %2: %]Last contour element too short for corner radius %4

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:** The last contour element is too short for the corner radius.

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:** Lengthen the contour element or reduce the corner radius.  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61930**      %[[Channel %1: ] Block %2: %]No contour available

**Parameters:** %1 = Channel number  
 %2 = Block number, label

**Explanation:**

**Reaction:** Interpreter stop  
 NC Start disable in this channel.  
 Interface signals are set.  
 Alarm display.

**Remedy:**

- Check contour call
- Check whether the contours exist in the program storage (workpieces, subroutines or part programs)

**Programm continuation:** Clear alarm with the RESET key. Restart part program

#### **61931      %[[Channel %1: ] Block %2: %]Contour not closed**

**Parameters:**

- %1 = Channel number
- %2 = Block number, label

**Explanation:**

**Reaction:**

- Interpreter stop
- NC Start disable in this channel.
- Interface signals are set.
- Alarm display.

**Remedy:**

- Check whether the contours are closed

**Programm continuation:** Clear alarm with the RESET key. Restart part program

#### **61932      %[[Channel %1: ] Block %2: %]Selfcutting contour**

**Parameters:**

- %1 = Channel number
- %2 = Block number, label

**Explanation:**

**Reaction:**

- Interpreter stop
- NC Start disable in this channel.
- Interface signals are set.
- Alarm display.

**Remedy:**

- Modify contour programming

**Programm continuation:** Clear alarm with the RESET key. Restart part program

#### **61933      %[[Channel %1: ] Block %2: %]Too many contour elements**

**Parameters:**

- %1 = Channel number
- %2 = Block number, label

**Explanation:**

**Reaction:**

- Interpreter stop
- NC Start disable in this channel.
- Interface signals are set.
- Alarm display.

**Remedy:**

- Modify contour programming and thereby try to reduce the number of contour elements

**Programm continuation:** Clear alarm with the RESET key. Restart part program

#### **61934      %[[Channel %1: ] Block %2: %]Programming of the machining plane not allowed here**

**Parameters:**

- %1 = Channel number
- %2 = Block number, label

**Explanation:**

**Reaction:**

- Interpreter stop
- NC Start disable in this channel.
- Interface signals are set.
- Alarm display.

**Remedy:** - Modify contour programming  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61935**      **%[[Channel %1: ] Block %2: %]Programming of inch/metric measuring system not allowed here**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:** - Modify contour programming  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61936**      **%[[Channel %1: ] Block %2: %]G0 is not allowed in contour programming**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:** - Modify contour programming, replace G0 by G1  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61937**      **%[[Channel %1: ] Block %2: %]Pocket depth programmed incorrectly**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

**Remedy:** - Check parameter Z1  
**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61938**      **%[[Channel %1: ] Block %2: %]No starting point specified**

**Parameters:**    %1 = Channel number  
                      %2 = Block number, label

**Explanation:**

**Reaction:**        Interpreter stop  
                      NC Start disable in this channel.  
                      Interface signals are set.  
                      Alarm display.

#### **61944      %[[Channel %1: ] Block %2: %]Ramp path too short**

|                               |                                                                                                                                                                                                                                |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                                                |
| <b>Explanation:</b>           | During oscillating insertion, the message "Ramp path too short" occurs if the tool moves less than the mill diameter away from the insertion point on the ramp path or the machining depth is not reached.                     |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                                          |
| <b>Remedy:</b>                | - Reduce the insertion angle if the tool remains too near to the insertion point<br>- Enlarge insertion angle if the tool does not reach the machining depth<br>- Use tool with smaller radius<br>- Use another insertion mode |
| <b>Programm continuation:</b> | Clear alarm with the RESET key. Restart part program                                                                                                                                                                           |

---

| <b>61957</b>                  | <b>%[[Channel %1: ] Block %2: %]Straight contour finish not possible</b>                                                                                                                                      |
| <b>Parameters:</b>            | %1 = Channel number<br>%2 = Block number, label                                                                                                                                                               |
| <b>Explanation:</b>           | The programmed finish contour is not possible because of the length of the last contour element.                                                                                                              |
| <b>Reaction:</b>              | Interpreter stop<br>NC Start disable in this channel.<br>Interface signals are set.<br>Alarm display.                                                                                                         |
| <b>Remedy:</b>                | Adapt contour                                                                                                                                                                                                 |

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61958 %[[Channel %1: ] Block %2: %]Straight contour element too short**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The straight contour element is too short.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check and adapt contour

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61959 %[[Channel %1: ] Block %2: %]Contour elements overlap**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** Elements of the contour overlap.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Eliminate the contour overlaps.

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61960 %[[Channel %1: ] Block %2: %]Contour radius too small**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The contour radius is too small for the desired slot width.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check validity of contour

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61961 %[[Channel %1: ] Block %2: %]Circular contour element too short**

**Parameters:** %1 = Channel number  
%2 = Block number, label

**Explanation:** The circular contour element is too short.

**Reaction:** Interpreter stop  
NC Start disable in this channel.  
Interface signals are set.  
Alarm display.

**Remedy:** Check contour

**Programm continuation:** Clear alarm with the RESET key. Restart part program

---

**61962      %[[Channel %1: ] Block %2: %]Plane infeed %4 too small**

**Parameters:**      %1 = Channel number

---

**62301 [Channel %1: ] Block %2: Notice! Search run, test run or simulation active**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:**

**Reaction:** Alarm display.

**Remedy:** - Deactivate program test or test run

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**62303 [Channel %1: ] Block %2: Safety margin exceeded %4**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:**

**Reaction:** Alarm display.

**Remedy:** - Check setpoint value and parameter \_TSA

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**62304 [Channel %1: ] Block %2: Allowance**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:** The difference between actual and setpoint measurements is greater than the upper tolerance limit (screen parameter TUL):

- TUL is the upper tolerance limit of the measurement difference.
- TUL is always related to the material, irrespective of whether external or internal machining is involved.
- The hole/pocket is thus too small and the spigot is too large.
- This means that further material can be removed.
- The measuring cycle parameter TUL corresponds to "upper deviation", the usual term used in mechanical engineering for fits and tolerances.

**Reaction:** Alarm display.

**Remedy:** The difference between actual and setpoint value is larger than upper tolerance limit (parameter \_TUL).

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**62305 [Channel %1: ] Block %2: Dimension too small**

**Parameters:** %1 = Channel number  
 %2 = Block number, label channel number

**Explanation:** The difference between the actual and setpoint measurement is less than the lower tolerance limit (screen parameter TLL):

- TLL is the lower tolerance limit of the measurement difference.
- TLL is always related to the material, irrespective of whether external or internal machining is involved.
- The hole/pocket is thus too large and the spigot too small.
- This means that too much material has already been removed.
- The measuring cycle parameter TLL corresponds to "lower deviation", the usual term used in mechanical engineering for fits and tolerances.

**Reaction:** Alarm display.

**Remedy:** The difference between actual and setpoint value is smaller than lower tolerance limit (parameter \_TLL).

**Programm continuation:** Clear alarm with the Delete key or NC START.

| <b>Explanation:</b>           | This alarm is only output with external measurements (web, spigot, ball) as a query about the program continuation before the lowering movement in the infeed axis<br><br>The alarm scan is caused by the reduction of the path of the measuring axis in the working plane that has just been made. If the path had not been reduced, the traversing movement would have extended beyond the software end position of the working plane. A corresponding NCK alarm 10722 would have been triggered.<br><br>With program stop, the user can check whether the infeed axis can be lowered to measuring height without causing a collision.<br><br>Alarm 61402 is output if there is a switch (collision) of the probe in the subsequent movement of the infeed axis. |

---

**62322 [Channel %1: ] Block %2: Rotary axis 2: Diameter tolerance of calibration ball between measurement %4 exceeded**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:** see measured diameter in the parameters \_OVR[75] to \_OVR[77] or the value in SD \$SCS\_MEA\_KIN\_DM\_TOL

**Reaction:** Alarm display.

**Remedy:** Check the calibration data or recalibrate the 3D probe  
Check the mechanical structure of the calibration ball in the machine

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**62377 [Channel %1: ] Block %2: Dimensional tolerance %4 exceeded**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Reaction:** Alarm display.

**Remedy:**

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**62500 [Channel %1: ] Block %2: GWPS has been limited**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Reaction:** Alarm display.

**Remedy:** Check limit value for GWPS and program a lower value in the NC program if necessary

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**62501 [Channel %1: ] Block %2: Speed has been limited**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Reaction:** Alarm display.

**Remedy:** Check limit value for speed and program a lower value in the NC program if necessary

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**62502 [Channel %1: ] Block %2: Dresser %4, GWPS has been limited**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Reaction:** Alarm display.

**Remedy:** Check limit value for GWPS and program a lower value in the NC program if necessary

**Programm continuation:** Clear alarm with the Delete key or NC START.

---

**62503 [Channel %1: ] Block %2: Dresser %4, speed has been limited**

**Parameters:** %1 = Channel number  
%2 = Block number, label channel number

**Explanation:**

**Reaction:** Alarm display.

**Remedy:** Check limit value for speed and program a lower value in the NC program if necessary

**Programm continuation:** Clear alarm with the Delete key or NC START.

|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>120407</b>                 | <b>SINAMICS: Read job for parameter %1, area %2: %3 s timeout!</b>                                                                                                                                                                                                                                                                                                                        |
| <b>Parameters:</b>            | <p>%1 = Number of the parameter whose value was read.</p> <p>%2 = Area (drive object class to which the write job was addressed)</p> <p>%3 = Time required to read the parameter.</p>                                                                                                                                                                                                     |
| <b>Explanation:</b>           | It is taking too long to read a SINAMICS parameter. This can slow down the operation of a connected HMI significantly.                                                                                                                                                                                                                                                                    |
| <b>Reaction:</b>              | Alarm display.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Remedy:</b>                | <p>1. Acknowledge alarm.</p> <p>2. Check drive load: The CPU time load values in parameter r9976 for the corresponding Control Unit should be less than 80%.</p> <p>3. **150002 Error in the AST Kernel Library: %1**

**Explanation:** Automatic axis optimization has failed.  
Auto Servo Tuning canceled optimization because of an error.

**Reaction:** Alarm display.

**Remedy:** Place a support request with the error text under: <http://www.siemens.com/automation/support-request>

**Programm continuation:** Internal

---

**150003 Auto Servo Optimization has aborted the optimization. Reason: %1 (%2<AST>)**

**Explanation:** Automatic axis optimization has failed.  
Ensure that:

1. The channel is in RESET.
2. The axis can be traversed in JOG mode.
3. The axis optimization calls in the part program are neither incorrect nor incomplete.

**Reaction:** Alarm display.

**Remedy:** Look up error number in the user documentation.  
After debugging, restart the part program.

**Programm continuation:** Internal

---

**150004 AST Kernel Library has aborted the optimization. Reason: %1 (%2<AST>)**

**Explanation:** Automatic axis optimization has failed.  
The axis optimization calls in the part program are probably incorrect or incomplete.

**Reaction:** Alarm display.

**Remedy:** Look up error number in the user documentation.  
After debugging, restart the part program.

**Programm continuation:** Internal

---

**150005 Auto Servo Tuning was canceled by the user.**

**Explanation:** Automatic axis optimization was canceled by the user.

**Reaction:** Alarm display.

**Remedy:** The part program must be restarted.

**Programm continuation:** Internal

---

**150006 Auto Servo Optimization has aborted the optimization. Reason: %1 (%2<AST>)**

**Explanation:** An error has occurred during a measurement of the automatic axis optimization.

**Reaction:** Alarm display.

**Remedy:**

- 1: Unselect the REF/TEACH/single block function.
- 2: Press the "Feedrate enable" key.
- 3: Increase the feedrate of the axis.
- 4: Press the "Spindle enable" key.
- 5: Reference the axis.
- 6: First stop other measurements. Check parameter p4701 of the CU. Exit all external operates which access the control.
- 7: First stop the trace (drive). Check parameter p4700 of the CU. Exit all external operates which access the control.
- 8: Check ON/OFF1 signal enable in the axis diagnostics and, if necessary, set parameter p840 in the drive parameters.
- 9: Check ON/OFF1 signal enable of the infeed and, if necessary, set parameter p840 in the drive parameters.

After debugging, the part program must be restarted.

### 150100      **Adaptation of the softkey access levels active**

**Explanation:** The alarm signalizes that the commissioning mode for softkeys has been activated.  
In this mode, the access level of a softkey can be reassigned by a right click on the softkey.

**Reaction:** Alarm display.

**Remedy:** The alarm disappears automatically as soon as the commissioning mode for softkeys is terminated.

**Programm  
continuation:** Internal

---

### 150201      **Communication to %1 failed**

**Parameters:** %1 = Source URL of the component involved

**Explanation:** The operator panel is connected to the NC and PLC by a communications bus.  
This alarm occurs when the communication to these components is interrupted.  
In connection with this alarm, all display values connected with the NC/PLC become invalid.  
Such faults are normal while the controls are ramping up (e.g. after resetting).

**Reaction:** Alarm display.

**Remedy:** The alarm disappears automatically as soon as the fault situation has ended.  
If this alarm is continuously present, a wide variety of faults may be the cause. (e.g. wire breakage, NC/PLC not ramped up, faulty address/data transfer rate configuration of one of the bus nodes, etc.).

**Programm  
continuation:** Internal

---

### 150202      **Waiting for a connection to %1**

**Parameters:** %1 = Source URL of the component involved

**Explanation:** The operator panel is connected to the NC and PLC by a communications bus.  
This alarm occurs if the MMC is started for the first time and the NC/PLC ramp-up has not yet finished or the communication to these components is faulty.  
In conjunction with this alarm, all display values connected with the NC/PLC become invalid.  
Such faults are normal while the controls are starting up (e.g. after resetting).

**Reaction:** Alarm display.

**Remedy:** The alarm disappears automatically as soon as the fault situation has ended.  
If this alarm is continuously present, a wide variety of faults may be the cause. (e.g. wire breakage, NC/PLC not ramped up, faulty address/data transfer rate configuration of one of the bus nodes, etc.).

**Programm  
continuation:** Internal

---

### 150204      **----- Start alarm acquisition -----**

**Explanation:** The alarm indicates the start or restart of alarm acquisition in the alarm log.  
If the alarm log has been configured so that it is persistently written into the file system, a further alarm is written into the log at each new start. The alarm thus separates the individual time intervals during which alarm acquisition is active.  
The coming and going time stamps are identical, and correspond to the time of the start/restart of the alarm acquisition.  
The alarm is only visible in the alarm log.

**Reaction:** Alarm display.

**Remedy:** The alarm can but need not be deleted as it is only visible in the alarm log.

**Programm  
continuation:** Internal

**150401      '%1' : '%2' cannot be reselected in channel '%3'**

**Parameters:**      %1 = Name of the NCU for which reselection is to be made.  
                          %2 = Program name with path details.  
                          %3 = Channel number for reselection.

**Explanation:**      On the NCU, the program could not be automatically selected for the channel for external execution.  
                          Please check whether the channel is in reset and if the program is present.

**Reaction:**          Alarm display.

**Remedy:**            The alarm disappears automatically as soon as the program is selected on the NCU for the channel for 'Execution from external source'

**Programm  
continuation:** Internal

---

**150402      The buffered memory for the 'NC Extend' drive is full**

**Explanation:**      The alarm indicates that the 'NC Extend' drive is full.  
                          Please delete programs that are no longer needed from the local drive.

**Reaction:**          Alarm display.

**Remedy:**            The alarm disappears automatically as soon as sufficient memory space is available again.

**Programm  
continuation:** Internal

---

**150403      The set user memory on the 'local drive'/'NC Extend' has been exceeded, see display MD HMI\_MEM\_LIMIT\_USER**

**Explanation:**      The alarm indicates that the user memory set in display MD HMI\_MEM\_LIMIT\_USER is full.  
                          Please delete data that is no longer needed from the local drive/NC Extend.

**Reaction:**          Alarm display.

**Remedy:**            The alarm disappears automatically as soon as sufficient memory space is available again.

**Programm  
continuation:** Internal

---

**150404      The available manufacturer memory has been exceeded, see display MD HMI\_MEM\_LIMIT\_USER**

**Explanation:**      The alarm indicates that the available manufacturer memory set in display MD HMI\_MEM\_LIMIT\_USER is full.  
                          Please delete data that is no longer needed from manufacturer area of the CF card.

**Reaction:**          Alarm display.

**Remedy:**            The alarm disappears automatically as soon as sufficient memory space is available again.

**Programm  
continuation:** Internal

---

**150405      The SD card is almost full**

**Explanation:**      The alarm indicates that the SD card is almost full.  
                          Delete any programs that are no longer needed on the local drive and/or any data on the SD card.

**Reaction:**          Alarm display.

**Remedy:**            The alarm disappears automatically as soon as sufficient memory space is available again.

**Programm  
continuation:** Internal

---

**150406      The memory available for users and manufacturer data (6 GB) is full**

**Explanation:** The alarm indicates that the area for users and manufacturer data is full.  
Please delete programs that are no longer needed from the drives.

**Reaction:** Alarm display.

**Remedy:** The alarm disappears automatically as soon as sufficient memory space is available again.

**Programm continuation:** Internal

---

**150407      /install directory exceeds the permissible size, please correct.**

**Explanation:** The alarm indicates that the install directory is too full.  
Please delete data that are no longer needed with external tools, and restart the HMI.

**Reaction:** Alarm display.

**Remedy:** The alarm does not disappear until the next HMI restart after the cause has been eliminated.

**Programm continuation:** Internal

---

**150408      The available memory for manufacturer 'oem' and/or 'individual' is full**

**Explanation:** The alarm indicates that the manufacturer drive 'oem' and/or 'individual' is full.  
Delete any files on the drive that you no longer need.

**Reaction:** Alarm display.

**Remedy:** The alarm disappears automatically as soon as sufficient memory space is available.

**Programm continuation:** Internal

---

**150410      Action not possible. Option not set: %1**

**Explanation:** The functionality can only be executed if the corresponding option is set.  
In the operating area "Setup", set (HSK) "Licenses", (VSK) "All options"

**Reaction:** Alarm display.

**Remedy:** The alarm disappears when the option is set and the HMI is then rebooted.

**Programm continuation:** Internal

---

**150411      Texts in the PLC project have been changed!%nIf required, they must be imported and the HMI restarted.**

**Explanation:** Loading new texts to the PLC requires an HMI reboot.  
If texts have been changed in the PLC project, they have to be imported, and the HMI restarted if they are used in the HMI, e.g. alarm texts.

**Reaction:** Alarm display.

**Remedy:** The alarm disappears on HMI reboot.

**Programm continuation:** Internal

---

**150412      No information on SIEMENS registration available.**

**Explanation:** Checking the machine registration is activated and has failed.  
The machine is not registered with SIEMENS.

**Reaction:** Alarm display.

**Remedy:** The alarm disappears if the machine is registered with Siemens. The registration can be made in the operating area "Diagnostics" in the operating screen "Version" with the softkey "Register machine". Scan the QR code in the operating screen "Register machine". This code leads via a link to the official SIEMENS registration page. Enter the necessary information on the registration page to receive the 12-digit registration code. The 12-digit registration code must then be entered in the operating screen "Register machine". Please ensure that the registered CF card is also inserted in the registered NCU.

**150413 Backup data archive could not be created, next attempt tomorrow at %1%n %2 .**

**Parameters:** %1 = Time of next data backup

%2 = Cause of the error

**Explanation:** The creation of automatic data backup archives is enabled. However, no data backup archive could be created due to errors. A new attempt will be made after 24 hours.

**Reaction:** Alarm display.

**Remedy:** The alarm explains the cause of the error and how to fix it.

It disappears with the next successful data backup.

**Programm  
continuation:** Internal

---

**150414 The creation of the automatic data backup archive will start in %1 minutes.**

**Parameters:** %1 = Number of minutes

**Explanation:** The creation of automatic data backup archives is enabled and notification of the start of the data backup has been given. Notifications appear at two-minute intervals starting 10 minutes before the start.

**Reaction:** Alarm display.

**Remedy:** The alarm disappears once the system starts the data backup.

**Programm  
continuation:** Internal

---

**150420 Please set Windows enable and distribute drives.**

**Explanation:** The alarm signals that logon data for EES drives are missing.  
Please set Windows enable under Setup/HMI/Log. drives, and distribute drives.

**Reaction:** Alarm display.

**Remedy:** The alarm disappears automatically as soon as the logon data have been set for Windows enable and the drives have been distributed.

**Programm  
continuation:** Internal

---

**150421 The drive configuration is being distributed and activated on NCU %1**

**Parameters:** %1 = Name of the NCU on which the drive configuration is being distributed.

**Explanation:** The alarm signals that the drives are being distributed.

**Reaction:** Alarm display.

**Remedy:** The alarm disappears automatically as soon as the drives have been activated on the NCU.

### 201000 <location>Internal software error

**Drive object:** 'All objects

**Message value:** Module: %1, line: %2

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.

**Remedy:**

- evaluate fault buffer (r0945).
- carry out a POWER ON (switch-off/switch-on) for all components.
- if required, check the data on the non-volatile memory (e.g. memory card).
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

---

### 201001 <location>FloatingPoint exception

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** An exception occurred for an operation with the FloatingPoint data type.  
The error can be caused by the basic system or a technology function (e.g. FBLOCKS, DCC, TEC).  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.  
Note:

Refer to r9999 for additional information about this fault.

r9999[0]: Fault number.

r9999[1]: Program counter at the time when the exception occurred.

r9999[2]: Cause of the FloatingPoint exception.

Bit 0 = 1: Operation invalid

Bit 1 = 1: Division by zero

Bit 2 = 1: Overflow

Bit 3 = 1: Underflow

Bit 4 = 1: Inaccurate result

**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- check configuration and signals of the blocks in FBLOCKS.
- check configuration and signals of DCC charts.
- check configuration and signals of TEC charts.
- upgrade firmware to later version.
- contact Technical Support.

---

**201002 <location>Internal software error****Drive object:** 'All objects**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

---

**201003 <location>Acknowledgment delay when accessing the memory****Drive object:** 'All objects**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY**Cause:** A memory area was accessed that does not return a "READY".  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.**Remedy:**

- carry out a POWER ON (switch-off/switch-on) for all components.
- contact Technical Support.

---

**201004 <location>Internal software error****Drive object:** 'All objects**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** An internal software error has occurred.  
Fault value (r0949, hexadecimal):  
Only for internal Siemens troubleshooting.**Remedy:**

- read out diagnostics parameter (r9999).
- contact Technical Support.

| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                         |
| <b>Cause:</b>         | <p>The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit.</p> <p>Alarm value (r2124, interpret decimal):</p> <p>Component number of the DRIVE-CLiQ component.</p> |

**Remedy:** Update the firmware using the commissioning tool:  
The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out.  
Firmware update via parameter:  
- take the component number from the alarm value and enter into p7828.  
- start the firmware download with p7829 = 1.

---

**201007 <location>POWER ON for DRIVE-CLiQ component required**

**Drive object:** 'All objects

**Message value:** Component number: %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A DRIVE-CLiQ component must be switched on again (POWER ON) (e.g. due to a firmware update).

Alarm value (r2124, interpret decimal):

Component number of the DRIVE-CLiQ component.

**Note:**

For a component number = 1, a POWER ON of the Control Unit is required.

**Remedy:** - Switch off the power supply of the specified DRIVE-CLiQ component and switch it on again.  
- For SINUMERIK, auto commissioning is prevented. In this case, a POWER ON is required for all components and the auto commissioning must be restarted.

---

**201009 <location>CU: Control module overtemperature**

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.

**Remedy:** - check the air intake for the Control Unit.

- check the Control Unit fan.

**Note:**

The alarm is automatically withdrawn once the limit value has been fallen below.

---

**201010 <location>Drive type unknown**

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** An unknown drive type was found.

Fault value (r0949, interpret decimal):

Drive object number (refer to p0101, p0107).

**Remedy:** - replace Power Module.  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade firmware to later version.  
- contact Technical Support.

## 201014 <location>Topology: DRIVE-CLiQ component property changed

|                      |              |
|----------------------|--------------|
| <b>Drive object:</b> | 'All objects |
|----------------------|--------------|

**Message value:** Component number: %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The properties of the DRIVE-CLiQ component have fundamentally changed.  
Fault value (r0949, interpret hexadecimal):  
Component number.  
**Remedy:**  
- check the DRIVE-CLiQ component, and if required replace.  
- carry out a warm restart (p0009 = 30, p0976 = 2, 3).

---

**201015 <location>Internal software error**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.  
**Remedy:**  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade firmware to later version.  
- contact Technical Support.

---

**201016 <location>Firmware changed**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** At least one firmware file in the directory was illegally changed on the non-volatile memory (memory card/device memory) with respect to the version when shipped from the factory.  
Alarm value (r2124, interpret decimal):  
0: Checksum of one file is incorrect.  
1: File missing.  
2: File too many.  
3: Incorrect firmware version.  
4: Incorrect checksum of the back-up file.  
**Remedy:** For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition.  
Note:  
The file involved can be read out using parameter r9925.  
The status of the firmware check is displayed using r9926.  
See also: r9925 (Firmware file incorrect), r9926 (Firmware check status)

#### 201030 <location>Sign-of-life failure for master control

|                       |                                                                               |
|-----------------------|-------------------------------------------------------------------------------|
| <b>Drive object:</b>  | A_INF_828, B_INF_828, HLA_828, S_INF_828, S_INF_COMBI, SERVO_828, SERVO_COMBI |
| <b>Message value:</b> | -                                                                             |

**Reaction:** Infeed: OFF1 (NONE, OFF2)  
Servo: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)  
Hla: OFF3 (NONE, OFF1, OFF2, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** For active PC master control, no sign-of-life was received within the monitoring time.  
The master control was returned to the active BICO interconnection.

**Remedy:** Set the monitoring time higher at the PC or, if required, completely disable the monitoring function.  
The monitoring time is set as follows using the commissioning tool:  
<Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds.  
Notice:  
The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

---

**201031 <location>Sign-of-life failure for OFF in REMOTE**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** Infeed: OFF1 (NONE, OFF2)  
Servo: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)  
Hla: OFF3 (NONE, OFF1, OFF2, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** With the "OFF in REMOTE" mode active, no sign-of-life was received within 3 seconds.

**Remedy:** - check the data cable connection at the serial interface for the Control Unit (CU) and operator panel.  
- check the data cable between the Control Unit and operator panel.

---

**201032 <location>ACX: all parameters must be saved**

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The parameters of an individual drive object were saved (p0971 = 1), although there is still no backup of all drive system parameters.  
The saved object-specific parameters are not loaded the next time that the system powers up.  
For the system to successfully power up, all of the parameters must have been completely backed up.  
Alarm value (r2124, interpret decimal):  
Only for internal Siemens troubleshooting.  
See also:p0971 (Save drive object parameters)

**Remedy:** Save all parameters (p0977 = 1 or "copy RAM to ROM").  
See also:p0977 (Save all parameters)

---

**201033 <location>Units changeover: Reference parameter value invalid**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Parameter: %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** When changing over the units to the referred representation type, it is not permissible for any of the required reference parameters to be equal to 0.0  
Fault value (r0949, parameter):  
Reference parameter whose value is 0.0.  
See also:p0349 (System of units motor equivalent circuit diagram data), p0505 (Selecting the system of units)

**Remedy:** Set the value of the reference parameter to a number different than 0.0.  
See also:p0304, p0305, p0310, p2000, p2001, p2002, p2003, r2004

---

### 201034 <location>Units changeover: Calculation parameter values after reference value change unsuccessful

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** Parameter: %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The change of a reference parameter meant that for an involved parameter the selected value was not able to be re-calculated in the per unit representation. The change was rejected and the original parameter value restored.  
Fault value (r0949, parameter):  
Parameter whose value was not able to be re-calculated.  
See also:p0304, p0305, p0310, p2000, p2001, p2002, p2003, r2004

**Remedy:** - Select the value of the reference parameter such that the parameter involved can be calculated in the per unit representation.  
- technology unit selection (p0595) before changing the reference parameter p0596, set p0595 = 1.

---

### 201035 <location>ACX: Parameter back-up file corrupted

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When the Control Unit is booted, no complete data set was found from the parameter back-up files. The last time that the parameterization was saved, it was not completely carried out.  
It is possible that the backup was interrupted by switching off or withdrawing the memory card.  
Alarm value (r2124, interpret hexadecimal):  
ddccbbaa hex:  
aa = 01 hex:  
Power up was realized without data backup. The drive is in the factory setting.  
aa = 02 hex:  
The last available backup data record was loaded. The parameterization must be checked. It is recommended that the parameterization is downloaded again.  
dd, cc, bb:  
Only for internal Siemens troubleshooting.  
See also:p0971 (Save drive object parameters), p0977 (Save all parameters)

**Remedy:** - download the project again using the commissioning tool.  
- save all parameters (p0977 = 1 or "copy RAM to ROM").  
See also:p0977 (Save all parameters)

---

### 201036 <location>ACX: Parameter back-up file missing

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** Infeed: NONE (OFF2)  
Servo: NONE (OFF1, OFF2, OFF3)  
Hla: NONE (OFF1, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

## 201040 <location>Save parameter settings and carry out a POWER ON

|                       |                                                                                                                                                                  |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Drive object:</b>  | 'All objects                                                                                                                                                     |
| <b>Message value:</b> | -                                                                                                                                                                |
| <b>Reaction:</b>      | OFF2                                                                                                                                                             |
| <b>Acknowledge:</b>   | POWER ON                                                                                                                                                         |
| <b>Cause:</b>         | A parameter was changed, which means that it is necessary to save the parameters and reboot.                                                                     |
| <b>Remedy:</b>        | - save parameters (p0971, p0977).<br>- carry out a POWER ON (switch-off/switch-on) for all components.<br>Then:<br>- upload the drive unit (commissioning tool). |

---

## 201041 <location>Parameter save necessary

|                       |              |
|-----------------------|--------------|
| <b>Drive object:</b>  | 'All objects |
| <b>Message value:</b> | %1           |
| <b>Reaction:</b>      | NONE         |
| <b>Acknowledge:</b>   | IMMEDIATELY  |

**Cause:** Defective or missing files were detected on the memory card when booting.

Fault value (r0949, interpret decimal):

- 1: Source file cannot be opened.
- 2: Source file cannot be read.
- 3: Target directory cannot be set up.
- 4: Target file cannot be set up/opened.
- 5: Target file cannot be written to.

Additional values:

Only for internal Siemens troubleshooting.

**Remedy:**

- save the parameters.
- download the project again to the drive unit.
- update the firmware
- if required, replace the Control Unit and/or memory card.

---

Hla: OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b> | <p>An error was detected when downloading a project using the commissioning software (e.g. incorrect parameter value). It is possible that the parameter limits are dependent on other parameters.</p> <p>The detailed cause of the fault can be determined using the fault value.</p> <p>Fault value (r0949, interpret hexadecimal):</p> <p>cbbbaaaa hex</p> <p>aaaa = Parameter</p> <p>bb = Index</p> <p>cc = fault cause</p> <p>0: Parameter number illegal.</p> <p>1: Parameter value cannot be changed.</p> <p>2: Lower or upper value limit exceeded.</p> <p>3: Sub-index incorrect.</p> <p>4: No array, no sub-index.</p> <p>5: Data type incorrect.</p> <p>6: Setting not permitted (only resetting).</p> <p>7: Descriptive element cannot be changed.</p> <p>9: Descriptive data not available.</p> <p>11: No master control.</p> <p>15: No text array available.</p> <p>17: Task cannot be executed due to operating state.</p> <p>20: Illegal value.</p> <p>21: Response too long.</p> <p>22: Parameter address illegal.</p> <p>23: Format illegal.</p> <p>24: Number of values not consistent.</p> <p>25: Drive object does not exist.</p> <p>101: Presently deactivated.</p> <p>104: Illegal value.</p> <p>107: Write access not permitted when controller enabled.</p> <p>108: Unit unknown.</p> <p>109: Write access only in the commissioning state, encoder (p0010 = 4).</p> <p>110: Write access only in the commissioning state, motor (p0010 = 3).</p> <p>111: Write access only in the commissioning state, power unit (p0010 = 2).</p> <p>112: Write access only in the quick commissioning mode (p0010 = 1).</p> <p>113: Write access only in the ready mode (p0010 = 0).</p> <p>114: Write access only in the commissioning state, parameter reset (p0010 = 30).</p> <p>115: Write access only in the Safety Integrated commissioning state (p0010 = 95).</p> <p>116: Write access only in the commissioning state, technological application/units (p0010 = 5).</p> <p>117: Write access only in the commissioning state (p0010 not equal to 0).</p> <p>118: Write access only in the commissioning state, download (p0010 = 29).</p> <p>119: Parameter may not be written in download.</p> <p>120: Write access only in the commissioning state, drive basic configuration (device: p0009 = 3).</p> <p>121: Write access only in the commissioning state, define drive type (device: p0009 = 2).</p> <p>122: Write access only in the commissioning state, data set basic configuration (device: p0009 = 4).</p> <p>123: Write access only in the commissioning state, device configuration (device: p0009 = 1).</p> <p>124: Write access only in the commissioning state, device download (device: p0009 = 29).</p> <p>125: Write access only in the commissioning state, device parameter reset (device: p0009 = 30).</p> <p>126: Write access only in the commissioning state, device ready (device: p0009 = 0).</p> <p>127: Write access only in the commissioning state, device (device: p0009 not equal to 0).</p> <p>129: Parameter may not be written in download.</p> <p>130: Transfer of the master control is inhibited via binector input p0806.</p> <p>131: Required BICO interconnection not possible because BICO output does not supply floating value</p> |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

132: Free BICO interconnection inhibited via p0922.  
133: Access method not defined.  
200: Below the valid values.  
201: Above the valid values.  
202: Cannot be accessed from the Basic Operator Panel (BOP).  
203: Cannot be read from the Basic Operator Panel (BOP).  
204: Write access not permitted.

**Remedy:**

- correct the parameterization in the commissioning tool and download the project again.
- enter the correct value in the specified parameter.
- identify the parameter that restricts the limits of the specified parameter.

---

**201043 <location>Fatal error at project download**

**Drive object:** 'All objects

**Message value:** Fault cause: %1

**Reaction:**

Infeed: NONE (OFF1, OFF2)  
Servo: NONE (OFF1, OFF2, OFF3)  
Hla: NONE (OFF1, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** A fatal error was detected when downloading a project using the commissioning tool.

Fault value (r0949, interpret decimal):

- 1: Device status cannot be changed to Device Download (drive object ON?).
- 2: Incorrect drive object number.
- 3: A drive object that has already been deleted is deleted again.
- 4: Deleting a drive object that has already been registered for generation.
- 5: Deleting a drive object that does not exist.
- 6: Generating an undeleted drive object that already existed.
- 7: Regenerating a drive object already registered for generation.
- 8: Maximum number of drive objects that can be generated exceeded.
- 9: Error while generating a device drive object.
- 10: Error while generating target topology parameters (p9902 and p9903).
- 11: Error when generating a drive object (global component).
- 12: Error when generating a drive object (drive component).
- 13: Unknown drive object type.
- 14: Drive status cannot be changed to "ready for operation" (r0947 and r0949).
- 15: Drive status cannot be changed to drive download.
- 16: Device status cannot be changed to "ready for operation".
- 17: It is not possible to download the topology. The component wiring should be checked, taking into account the various messages/signals.
- 18: A new download is only possible if the factory settings are restored for the drive unit.
- 19: The slot for the option module has been configured several times (e.g. CAN and COMM BOARD)
- 20: The configuration is inconsistent (e.g. CAN for Control Unit, however no CAN configured for drive objects A\_INF, SERVO or VECTOR).
- 21: Error when accepting the download parameters.
- 22: Software-internal download error.
- 23: download not possible when know-how protection is activated.
- 24: download not possible during a partial power up after inserting a component.
- 25: The configuration is inconsistent. Know-how protection is either not activated or only partially.

Additional values:

Only for internal Siemens troubleshooting.

- Remedy:**
- use the current version of the commissioning tool.
  - modify the offline project and carry out a new download (e.g. compare the number of drive objects, motor, encoder, power unit in the offline project and at the drive).
  - change the drive state (is a drive rotating or is there a message/signal?).
  - Observe additional active messages/signals and remove their cause (e.g. correct any incorrectly set parameters).
  - automatically calculate the control parameters (p0340). Then set p0010 = 0.
  - boot from previously saved files (switch-off/switch-on or p0976).
  - before a new download, restore the factory setting if the know-how protection was not activated on all drive objects.

---

**201044 <location>CU: Descriptive data error**

- Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** OFF2  
**Acknowledge:** POWER ON  
**Cause:** An error was detected when loading the descriptive data saved in the non-volatile memory.  
**Remedy:** Replace the memory card or Control Unit.

---

**201045 <location>CU: Configuring data invalid**

- Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** An error was detected when evaluating the parameter files PSxxxxxy.ACX, PTxxxxxy.ACX, CAxxxxxy.ACX, or CCxxxxxy.ACX saved in the non-volatile memory. Because of this, under certain circumstances, several of the saved parameter values were not able to be accepted.  
 Also see r9406 up to r9408.  
 Alarm value (r2124, interpret hexadecimal):  
 Only for internal Siemens troubleshooting.  
**Remedy:** - check the parameters displayed in r9406 up to r9408, and correct these if required.  
 - Restore the factory setting (p0976 = 1) and reload the project into the converter.  
 Then save the parameterization in STARTER using the function "Copy RAM to ROM" or with p0977 = 1. This overwrites the incorrect parameter files in the non-volatile memory – and this alarm is withdrawn.  
 See also: r9406 (PS file parameter number parameter not transferred), r9407 (PS file parameter index parameter not transferred), r9408 (PS file fault code parameter not transferred)

---

**201049 <location>CU: It is not possible to write to file**

- Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** It is not possible to write into a write-protected file (PSxxxxxx.acx). The write request was interrupted.  
 Alarm value (r2124, interpret decimal):  
 Drive object number.  
**Remedy:** Check whether the "write protected" attribute has been set for the files in the non-volatile memory under .../USER/SINAMICS/DATA/...  
 When required, remove write protection and repeat the save operation (e.g. set p0977 = 1).

---

**201050 <location>Memory card and device incompatible**

- Drive object:** 'All objects  
**Message value:** -

|                     |                                                                                                                 |
|---------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Reaction:</b>    | Infeed: OFF2 (NONE, OFF1)<br>Servo: OFF2 (NONE, OFF1, OFF3)<br>Hla: OFF2 (NONE, OFF1, OFF3)                     |
| <b>Acknowledge:</b> | IMMEDIATELY                                                                                                     |
| <b>Cause:</b>       | The memory card and the device type do not match (e.g. a memory card for SINAMICS S is inserted in SINAMICS G). |
| <b>Remedy:</b>      | - insert the matching memory card.<br>- use the matching Control Unit or power unit.                            |

**201056 <location>CU: Internal error (clock cycle of parameter group already assigned differently)**

|                       |                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------|
| <b>Drive object:</b>  | A_INF_828, B_INF_828, HLA_828, S_INF_828, S_INF_COMBI, SERVO_828, SERVO_COMBI, TM150 |
| <b>Message value:</b> | %1                                                                                   |

**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The requested parameter group (IREG, NREG, ...) is already being used in a different clock cycle.  
 Fault value (r0949, interpret hexadecimal):  
 Method ID.  
 Note:  
 Only for internal Siemens troubleshooting.  
**Remedy:** Contact Technical Support.

---

**201057 <location>CU: Internal error (different DRIVE-CLiQ type for the slave)**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM150  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The requested DRIVE-CLiQ type (hps\_ps, hps\_enc, ...) has been specified differently for the same slave component.  
 Fault value (r0949, interpret hexadecimal):  
 Method ID.  
 Note:  
 Only for internal Siemens troubleshooting.  
**Remedy:** Contact Technical Support.

---

**201058 <location>CU: Internal error (slave missing in topology)**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM150  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The requested slave component does not exist in the topology.  
 Fault value (r0949, interpret hexadecimal):  
 Method ID.  
 Note:  
 Only for internal Siemens troubleshooting.  
**Remedy:** Contact Technical Support.

---

**201059 <location>CU: Internal error (port does not exist)**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM150  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The port object assigned according to the topology of the requested slave component does not exist.  
 Fault value (r0949, interpret hexadecimal):  
 Method ID.  
 Note:  
 Only for internal Siemens troubleshooting.  
**Remedy:** Contact Technical Support.

---

**201060 <location>CU: Internal error (parameter group not available)**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM150  
**Message value:** %1  
**Reaction:** NONE

**Acknowledge:** IMMEDIATELY  
**Cause:** The requested parameter group (IREG, NREG, ...) is not offered by this slave type.  
Fault value (r0949, interpret hexadecimal):  
Method ID.  
Note:  
Only for internal Siemens troubleshooting.  
**Remedy:** Contact Technical Support.

---

**201061 <location>CU: Internal error (application not known)**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM150  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** An application that is not registered with TSM has attempted to register with registerSlaves().  
The cause can be an unsuccessful TSM registration or an incorrect registration sequence. It is always necessary to log in to the TSM before registerSlaves() can be used.  
Fault value (r0949, interpret hexadecimal):  
Method ID.  
Note:  
Only for internal Siemens troubleshooting.  
**Remedy:** Contact Technical Support.

---

**201063 <location>CU: Internal error (PDM)**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM150  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** An internal software error has occurred.  
Fault value (r0949, interpret hexadecimal):  
Method ID.  
Note:  
Only for internal Siemens troubleshooting.  
**Remedy:** Contact Technical Support.

---

**201064 <location>CU: Internal error (CRC)**

**Drive object:** 'All objects  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A checksum error (CRC error) has occurred in the Control Unit program memory  
**Remedy:**  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade firmware to later version.  
- contact Technical Support.

---

**201068 <location>CU: Data memory memory overflow**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY

**Cause:** The utilization for a data memory area is too large.  
 Fault value (r0949, interpret binary):  
 Bit 0 = 1: High-speed data memory 1 overloaded  
 Bit 1 = 1: High-speed data memory 2 overloaded  
 Bit 2 = 1: High-speed data memory 3 overloaded  
 Bit 3 = 1: High-speed data memory 4 overloaded

**Remedy:**

- deactivate the function module.
- deactivate drive object.
- remove the drive object from the target topology.

---

#### 201069 <location>Parameter backup and device incompatible

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The parameter backup on the memory card and the drive unit do not match.  
 The module boots with the factory settings.  
 Example:  
 Devices A and B. are not compatible and a memory card with the parameter backup for device A is inserted in device B.

**Remedy:**

- insert a memory card with compatible parameter backup and carry out a POWER ON.
- insert a memory card without parameter backup and carry out a POWER ON.
- save the parameters (p0977 = 1).

---

#### 201070 <location>Project/firmware is being downloaded to the memory card

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** An upgrade (project/firmware download) was initiated on the memory card.  
 While this fault is present, the corresponding update takes place with plausibility and consistency checks. After this, depending on the command option, a new boot (reset) for the Control Unit is initiated.  
 Caution:  
 During the upgrade and while this fault is present, it is not permissible to switch off the Control Unit.  
 If the operation is interrupted, this can destroy the file system on the memory card. The memory card will then no longer work properly and must be repaired.

**Remedy:** Not necessary.  
 The fault is automatically withdrawn after the upgrade has been completed.

---

#### 201072 <location>Memory card restored from the backup copy

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The Control Unit was switched-off while writing to the memory card. This is why the visible partition became defective.  
 After switching on, the data from the non-visible partition (backup copy) were written to the visible partition.

**Remedy:** Check that the firmware and parameterization is up-to-date.

---

#### 201073 <location>POWER ON required for backup copy on memory card

**Drive object:** 'All objects

|                       |                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Message value:</b> | -                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Reaction:</b>      | NONE                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Cause:</b>         | <p>The parameter assignment on the visible partition of the memory card has changed.</p> <p>In order that the backup copy on the memory card is updated on the non-visible partition, it is necessary to carry out a POWER ON or hardware reset (p0972) of the Control Unit.</p> <p>Note:</p> <p>It is possible that a new POWER ON is requested via this alarm (e.g. after saving with p0971 = 1).</p> |
| <b>Remedy:</b>        | <ul style="list-style-type: none"><li>- carry out a POWER ON (switch-off/switch-on) for the Control Unit.</li><li>- carry out a hardware reset (RESET button, p0972).</li></ul>                                                                                                                                                                                                                         |

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                |

**Cause:** Parameterizing errors have been detected (e.g. incorrect parameter value). It is possible that the parameter limits are dependent on other parameters.

The detailed cause of the fault can be determined using the fault value.

Fault value (r0949, interpret hexadecimal):

cbbbaaaa hex

aaaa = Parameter

bb = Index

cc = fault cause

0: Parameter number illegal.

1: Parameter value cannot be changed.

2: Lower or upper value limit exceeded.

3: Sub-index incorrect.

4: No array, no sub-index.

5: Data type incorrect.

6: Setting not permitted (only resetting).

7: Descriptive element cannot be changed.

9: Descriptive data not available.

11: No master control.

15: No text array available.

17: Task cannot be executed due to operating state.

20: Illegal value.

21: Response too long.

22: Parameter address illegal.

23: Format illegal.

24: Number of values not consistent.

25: Drive object does not exist.

101: Presently deactivated.

104: Illegal value.

107: Write access not permitted when controller enabled.

108: Unit unknown.

109: Write access only in the commissioning state, encoder (p0010 = 4).

110: Write access only in the commissioning state, motor (p0010 = 3).

111: Write access only in the commissioning state, power unit (p0010 = 2).

112: Write access only in the quick commissioning mode (p0010 = 1).

113: Write access only in the ready mode (p0010 = 0).

114: Write access only in the commissioning state, parameter reset (p0010 = 30).

115: Write access only in the Safety Integrated commissioning state (p0010 = 95).

116: Write access only in the commissioning state, technological application/units (p0010 = 5).

117: Write access only in the commissioning state (p0010 not equal to 0).

118: Write access only in the commissioning state, download (p0010 = 29).

119: Parameter may not be written in download.

120: Write access only in the commissioning state, drive basic configuration (device: p0009 = 3).

121: Write access only in the commissioning state, define drive type (device: p0009 = 2).

122: Write access only in the commissioning state, data set basic configuration (device: p0009 = 4).

123: Write access only in the commissioning state, device configuration (device: p0009 = 1).

124: Write access only in the commissioning state, device download (device: p0009 = 29).

125: Write access only in the commissioning state, device parameter reset (device: p0009 = 30).

126: Write access only in the commissioning state, device ready (device: p0009 = 0).

127: Write access only in the commissioning state, device (device: p0009 not equal to 0).

129: Parameter may not be written in download.

130: Transfer of the master control is inhibited via binector input p0806.

131: Required BICO interconnection not possible because BICO output does not supply floating value

132: Free BICO interconnection inhibited via p0922.  
133: Access method not defined.  
200: Below the valid values.  
201: Above the valid values.  
202: Cannot be accessed from the Basic Operator Panel (BOP).  
203: Cannot be read from the Basic Operator Panel (BOP).  
204: Write access not permitted.

**Remedy:**

- correct the parameterization in the commissioning tool and download the project again.
- enter the correct value in the specified parameter.
- identify the parameter that restricts the limits of the specified parameter.

---

**201097 <location>NTP server cannot be accessed**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The selected NTP server (p3105[0...3]) cannot be accessed. Time synchronization cannot be performed.

**Note:**

NTP: Network Time Protocol

**Remedy:** Correctly set the IP address of the NTP server, and check the connection to the NTP server.

---

**201099 <location>UTC synchronization tolerance violated**

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The tolerance (p3109) set for UTC synchronization was violated.

**Note:**

UTC: Universal Time Coordinates

See also:p3109 (UTC synchronization tolerance)

**Remedy:** Select the synchronization intervals shorter so that the deviation between the time of day master and drive system lies within the tolerance.

**Note:**

The deviation when synchronizing is shown in r3107.

See also:r3107 (UTC synchronization time out of tolerance)

---

**201100 <location>CU: Memory card withdrawn**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The memory card (non-volatile memory) was withdrawn during operation.

**Notice:**

It is not permissible for the memory card to be withdrawn or inserted under voltage.

**Remedy:**

- switch off the drive system.
- re-insert the memory card that was withdrawn - this card must match the drive system.
- switch on the drive system again.

---

|                       |                                                                                                                                                                                                                                                |

---

**Cause:** Illegal operation of various drive units on one Control Unit:  
- SINAMICS S together with SINAMICS G  
- SINAMICS S together with SINAMICS S Value or Combi  
Fault value (r0949, interpret decimal):  
Number of the first drive object with a different power unit type.

**Remedy:** Only power units of one particular drive type may be operated with one Control Unit.

---

**201112 <location>CU: Power unit not permissible**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY

**Cause:** The connected power unit cannot be used together with this Control Unit.  
Fault value (r0949, interpret decimal):  
1: Power unit is not supported (e.g. PM240).  
2: DC/AC power unit connected to CU310 not permissible.  
3: Power unit (S120M) not permitted for vector control.

**Remedy:** Replace the power unit that is not permissible by a component that is permissible.

---

**201120 <location>Terminal initialization has failed**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** OFF1 (OFF2)  
**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** An internal software error occurred while the terminal functions were being initialized.  
Fault value (r0949, interpret hexadecimal):  
Only for internal Siemens troubleshooting.

**Remedy:**  
- carry out a POWER ON (switch-off/switch-on) for all components.  
- upgrade firmware to later version.  
- contact Technical Support.  
- replace the Control Unit.

---

**201122 <location>Frequency at the measuring probe input too high**

**201150 <location>CU: Number of instances of a drive object type exceeded****Drive object:** 'All objects**Message value:** Drive object type: %1, number permitted: %2, actual number: %3**Reaction:** NONE**Acknowledge:** IMMEDIATELY**Cause:** The maximum permissible number of instances of a drive object type was exceeded.

Drive object type:

Drive object type (p0107), for which the maximum permissible number of instances was exceeded.

Number permitted:

Max. permissible number of instances for this drive object type.

Actual number:

Current number of instances for this drive object type.

Note regarding the message value:

The individual information is coded as follows in the message value (r0949/r2124):

ddccbbaa hex: aa = drive object type, bb = number limited, cc = actual number, dd = no significance

**Remedy:** - switch off the unit.

- suitably restrict the number of instances of a drive object type by reducing the number of inserted components.

- re-commission the unit.

---

| <b>Cause:</b>         | Insufficient processing time is available for the existing topology.<br>Fault value (r0949, interpret hexadecimal):<br>Only for internal Siemens troubleshooting. |

**Remedy:**

- reduce the number of drives.
- increase the sampling times.

---

#### **201221 <location>CU: Basic clock cycle too low**

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The closed-loop control / monitoring cannot maintain the envisaged clock cycle.  
 The runtime of the closed-loop control/monitoring is too long for the particular clock cycle or the computing time remaining in the system is not sufficient for the closed-loop control/monitoring.  
 Fault value (r0949, interpret hexadecimal):  
 Only for internal Siemens troubleshooting.

**Remedy:** Increase the basic clock cycle of DRIVE-CLiQ communication.  
 See also: p0112 (Sampling times pre-setting p0115)

---

#### **201222 <location>CU: Basic clock cycle too low (computing time for communication not available)**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM150

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** A time slice has not been defined that fulfills the requirements.  
 The port cannot be correctly operated as the alternating cyclic clock cycle cannot be maintained.  
 Fault value (r0949, interpret hexadecimal):  
 Method ID.  
 Note:  
 Only for internal Siemens troubleshooting.

**Remedy:** Contact Technical Support.

| <b>Cause:</b>  | <p>When changing a sampling time (p0115[0], p0799 or p4099), inconsistency between the clock cycles has been identified.</p> <p>Alarm value (r2124, interpret decimal):</p> <ul style="list-style-type: none"><li>1: Value lower than minimum value.</li><li>2: Value higher than maximum value.</li><li>3: Value not a multiple of 1.25 <math>\mu</math>s.</li><li>4: Value does not match isochronous PROFIBUS operation.</li><li>5: Value not a multiple of 125 <math>\mu</math>s.</li><li>6: Value not a multiple of 250 <math>\mu</math>s.</li><li>7: Value not a multiple of 375 <math>\mu</math>s.</li><li>8: Value not a multiple of 400 <math>\mu</math>s.</li><li>10: Special restriction of the drive object violated.</li><li>20: On a SERVO with a sampling time of 62.5 <math>\mu</math>s, more than two drive objects or one drive object of a type other than SERVO have been detected on the same DRIVE-CLiQ line (a maximum of two SERVO type drive objects are permitted).</li><li>21: Value can be a multiple of the current controller sampling time of a servo or vector drive in the system (e.g. for TB30, the values of all of the indices should be taken into account).</li><li>30: Value less than 31.25 <math>\mu</math>s.</li><li>31: Value less than 62.5 <math>\mu</math>s (31.25 <math>\mu</math>s is not supported for SMC10, SMC30, SMI10 and Double Motor Modules).</li><li>32: Value less than 125 <math>\mu</math>s.</li><li>33: Value less than 250 <math>\mu</math>s.</li><li>40: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 <math>\mu</math>s. Further, none of the nodes has a sampling time of less than 125 <math>\mu</math>s.</li><li>41: A chassis unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 250 <math>\mu</math>s.</li><li>42: An Active Line Module was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 125 <math>\mu</math>s.</li><li>43: A Voltage Sensing Module (VSM) was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is not equal to the current controller sampling time of the drive object of the VSM.</li><li>44: The highest common denominator of the sampling times of all of the components connected to the DRIVE-CLiQ line is not the same for all components of this drive object (e.g. there are components on different DRIVE-CLiQ lines on which different highest common denominators are generated).</li><li>45: A chassis parallel unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 162.5 <math>\mu</math>s or 187.5 <math>\mu</math>s (for a 2x or 3x parallel connection).</li><li>46: A node has been identified on the DRIVE-CLiQ line whose sampling time is not a multiple of the lowest sampling time on this line.</li><li>52: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 31.25 <math>\mu</math>s.</li><li>54: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 62.5 <math>\mu</math>s.</li><li>56: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 <math>\mu</math>s.</li><li>58: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 250 <math>\mu</math>s.</li><li>99: Inconsistency of cross drive objects detected.</li><li>116: Recommended clock cycle in r0116[0...1].</li></ul> <p>General note:</p> <p>The topology rules should be noted when connecting up DRIVE-CLiQ (refer to the appropriate product documentation). The parameters of the sampling times can also be changed with automatic calculations.</p> <p>Example for highest common denominator: 125 s, 125 <math>\mu</math>s, 62.5 <math>\mu</math>s --&gt; 62.5 <math>\mu</math>s</p> |

**201224 <location>CU: Pulse frequency inconsistent****Drive object:** 'All objects**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** When changing the minimum pulse frequency (p0113) inconsistency between the pulse frequencies was identified.

Alarm value (r2124, interpret decimal):

1: Value lower than minimum value.

2: Value higher than maximum value.

3: Resulting sampling time is not a multiple of 1.25 µs.

4: Value does not match isochronous PROFIBUS operation.

10: Special restriction of the drive object violated.

99: Inconsistency of cross drive objects detected.

116: Recommended clock cycle in r0116[0...1].

**Remedy:** Set a valid pulse frequency.

See also: p0113 (Minimum pulse frequency, selection)

---

**201250 <location>CU: CU-EEPROM incorrect read-only data****Drive object:** 'All objects**Message value:** %1**Reaction:** NONE (OFF2)**Acknowledge:** POWER ON**Cause:** Error when reading the read-only data of the EEPROM in the Control Unit.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:** - carry out a POWER ON (switch-off/switch-on).

- replace the Control Unit.

---

**201251 <location>CU: CU-EEPROM incorrect read-write data****Drive object:** 'All objects**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** Error when reading the read-write data of the EEPROM in the Control Unit.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:** For alarm value r2124 < 256, the following applies:

- carry out a POWER ON (switch-off/switch-on).

- replace the Control Unit.

For alarm value r2124 ≥ 256, the following applies:

- for the drive object with this alarm, clear the fault memory (p0952 = 0).

- as an alternative, clear the fault memory of all drive objects (p2147 = 1).

- replace the Control Unit.

---

**201255 <location>CU: Option Board EEPROM read-only data error****Drive object:** 'All objects**Message value:** %1**Reaction:** NONE (OFF2)**Acknowledge:** POWER ON

**Cause:** Error when reading the read-only data of the EEPROM in the Option Board.  
Fault value (r0949, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:** - carry out a POWER ON (switch-off/switch-on).  
- replace the Control Unit.

---

**201256 <location>CU: Option Board EEPROM read-write data error**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE

**Cause:** Error when reading the read-write data of the EEPROM in the Option Board.  
Alarm value (r2124, interpret decimal):  
Only for internal Siemens troubleshooting.

**Remedy:** - carry out a POWER ON (switch-off/switch-on).  
- replace the Control Unit.

**201260 <location>Software not released**

**Drive object:** 'All objects  
**Message value:** -  
**Reaction:** Infeed: OFF1  
Servo: OFF3  
Hla: OFF3

**Acknowledge:** POWER ON

**Cause:** The runtime software (RT-SW) has not been released.

**Remedy:** Only for internal Siemens troubleshooting.

---

**201275 <location>Hardware description error**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** Infeed: OFF2  
Servo: OFF3  
Hla: OFF3

**Acknowledge:** POWER ON

**Cause:** An error has occurred while accessing the hardware description file on the CompactFlash card.  
Directory and file name: ADDON/SINAMICS/DATA/HW\_DESC/<DOType>/DESC0000  
Fault value (r0949, interpret decimal):  
22: File not found.  
24: File read access error.  
26: Format error.  
28: Version error.  
30: Internal reader error.  
40: Contents error.  
45: Hardware description not consistent.  
60: Inconsistency: Number of Power Stack Adapters (PSA).  
61: Inconsistency: Number of Sensor Module Cabinets (SMC).  
62: Inconsistency: Number of Voltage Sensing Modules (VSM).  
63: Inconsistency: Number of Terminal Modules (TM).  
64: Inconsistency: Number of Terminal Boards (TB).

**Remedy:** Only for internal Siemens troubleshooting.

---

**201276 <location>Hardware description not fully compatible****Drive object:** 'All objects**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** The hardware description file contains more data than the firmware requires.**Remedy:** Not necessary.

---

**201302 <location>Error in the component trace****Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** An error has occurred in the component trace.

The message appears in the following cases:

- upload trace data (p7792 = 1).

- change factory setting (p7790, p7791) for missing property "component trace" (r0193.1 = 0).

Alarm value (r2124, interpret decimal):

1: The DRIVE-CLiQ component does not support the component trace (r0193.1 = 0).

101: Data from trace 1 cannot be read.

102: Data from trace 2 cannot be read.

103: Data from trace 3 cannot be read.

104: Data from trace 4 cannot be read.

105: Data from trace 5 cannot be read.

**Remedy:** For alarm value = 1:

Upgrade the firmware of the DRIVE-CLiQ component involved.

---

**201303 <location>Component does not support the required function****Drive object:** 'All objects**Message value:** %1**Reaction:** OFF2**Acknowledge:** IMMEDIATELY

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### 201317 <location>Deactivated component again present

|                       |              |
|-----------------------|--------------|
| <b>Drive object:</b>  | 'All objects |
| <b>Message value:</b> | -            |
| <b>Reaction:</b>      | NONE         |
| <b>Acknowledge:</b>   | NONE         |

**Cause:** If a component of the target topology for an active drive object is inserted and the associated parameter of the component is set to "deactivate" (p0125, p0145, p0155, p0165).

**Note:**

This is the only message that is displayed for a deactivated component.

**Remedy:** The alarm is automatically withdrawn for the following actions:

- activate the components involved (p0125 = 1, p0145 = 1, p0155 = 1, p0165 = 1).
- again withdraw the component involved.

See also: p0125 (Activate/deactivate power unit components), p0145, p0155, p0165 (Activate/deactivate filter module)

---

**201318 <location>BICO: Deactivated interconnections present**

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** This alarm is used in the following cases:

- if an inactive/non-operational drive object is active again/ready for operation
- if there are items in the list of BI/CI parameters (r9498[0...29], r9499[0...29])
- if the BICO interconnections saved in the list of BI/CI parameters (r9498[0...29], r9499[0...29]) have actually been changed

**Remedy:** Reset alarm:

- set p9496 to 1 or 2
- or
- deactivate the drive object again.

---

**201319 <location>Inserted component not initialized**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Initialization is required for at least one inserted component.

This is only possible if the pulses are inhibited for all the drive objects.

**Remedy:** Activate pulse inhibit for all drive objects.

---

**201320 <location>Topology: Drive object number does not exist in configuration**

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A drive object number is missing in p0978

Alarm value (r2124, interpret decimal):

Index of p0101 under which the missing drive object number can be determined.

**Remedy:** Set p0009 to 1 and change p0978:

Rules:

- p0978 must include all of the drive object numbers (p0101).
- it is not permissible for a drive object number to be repeated.
- by entering a 0, the drive objects with PZD are separated from those without PZD.
- only 2 partial lists are permitted. After the second 0, all values must be 0.
- dummy drive object numbers (255) are only permitted in the first partial list.

---

**201321 <location>Topology: Drive object number does not exist in configuration****Drive object:** 'All objects**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE

**Cause:** p0978 contains a drive object number that does not exist.  
 Alarm value (r2124, interpret decimal):  
 Index of p0978 under which the drive object number can be determined.

**Remedy:** Set p0009 to 1 and change p0978:  
 Rules:  
 - p0978 must include all of the drive object numbers (p0101).  
 - it is not permissible for a drive object number to be repeated.  
 - by entering a 0, the drive objects with PZD are separated from those without PZD.  
 - only 2 partial lists are permitted. After the second 0, all values must be 0.  
 - dummy drive object numbers (255) are only permitted in the first partial list.

---

**201322 <location>Topology: Drive object number present twice in configuration****Drive object:** 'All objects**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE

**Cause:** A drive object number is present more than once in p0978.  
 Alarm value (r2124, interpret decimal):  
 Index of p0978 under which the involved drive object number is located.

**Remedy:** Set parameter p0009 = 1 and change p0978:  
 Rules:  
 - p0978 must include all of the drive object numbers (p0101).  
 - it is not permissible for a drive object number to be repeated.  
 - by entering a 0, the drive objects with PZD are separated from those without PZD.  
 - only 2 partial lists are permitted. After the second 0, all values must be 0.  
 - dummy drive object numbers (255) are only permitted in the first partial list.

---

**201323 <location>Topology: More than two partial lists created****Drive object:** 'All objects**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE

**Cause:** Partial lists are available more than twice in p0978. After the second 0, all must be 0.  
 Alarm value (r2124, interpret decimal):  
 Index of p0978 under which the illegal value is located.

**Remedy:** Set p0009 to 1 and change p0978:  
 Rules:  
 - p0978 must include all of the drive object numbers (p0101).  
 - it is not permissible for a drive object number to be repeated.  
 - by entering a 0, the drive objects with PZD are separated from those without PZD.  
 - only 2 partial lists are permitted. After the second 0, all values must be 0.  
 - dummy drive object numbers (255) are only permitted in the first partial list.

---

**201324 <location>Topology: Dummy drive object number incorrectly created****Drive object:** 'All objects

| <b>Acknowledge:</b>   | NONE                                                                             |

- Cause:** Unable to carry out a quick commissioning. The existing actual topology does not fulfill the requirements.  
Alarm value (r2124, interpret hexadecimal):  
ccccbaa hex: cccc = preliminary component number, bb = supplementary information, aa = fault cause  
aa = 01 hex = 1 dec:  
On one component illegal connections were detected.
- bb = 01 hex = 1 dec: For a Motor Module, more than one motor with DRIVE-CLiQ was detected.
  - bb = 02 hex = 2 dec: For a motor with DRIVE-CLiQ, the DRIVE-CLiQ cable is not connected to a Motor Module.
- aa = 02 hex = 2 dec:  
The topology contains too many components of a particular type.
- bb = 01 hex = 1 dec: There is more than one master Control Unit.
  - bb = 02 hex = 2 dec: There is more than 1 infeed (8 for a parallel circuit configuration).
  - bb = 03 hex = 3 dec: There are more than 10 Motor Modules (8 for a parallel circuit configuration).
  - bb = 04 hex = 4 dec: There are more than 9 encoders.
  - bb = 05 hex = 5 dec: There are more than 8 Terminal Modules.
  - bb = 07 hex = 7 dec: Unknown component type
  - bb = 08 hex = 8 dec: There are more than 6 drive slaves.
  - bb = 09 hex = 9 dec: Connection of a drive slave not permitted.
  - bb = 0a hex = 10 dec: There is no drive master.
  - bb = 0b hex = 11 dec: There is more than one motor with DRIVE-CLiQ for a parallel circuit.
  - bb = 0c hex = 12 dec: Different power units are being used in a parallel connection.
- cccc: Not used.
- aa = 03 hex = 3 dec:  
More than 16 components are connected at a DRIVE-CLiQ socket of the Control Unit.
- bb = 0, 1, 2, 3 means e.g. detected at the DRIVE-CLiQ socket X100, X101, X102, X103.
- cccc: Not used.
- aa = 04 hex = 4 dec:  
The number of components connected one after the other is greater than 125.
- bb: Not used.
- cccc = preliminary component number of the first component and component that resulted in the fault.
- aa = 05 hex = 5 dec:  
The component is not permissible for SERVO.
- bb = 01 hex = 1 dec: SINAMICS G available.
  - bb = 02 hex = 2 dec: Chassis available.
- cccc = preliminary component number of the first component and component that resulted in the fault.
- aa = 06 hex = 6 dec:  
On one component illegal EEPROM data was detected. These must be corrected before the system continues to boot.
- bb = 01 hex = 1 dec: The Article No. [MLFB] of the power unit that was replaced includes a space retainer. The space retainer (\*) must be replaced by a correct character.
- cccc = preliminary component number of the component with illegal EEPROM data.
- aa = 07 hex = 7 dec:  
The actual topology contains an illegal combination of components.
- bb = 01 hex = 1 dec: Active Line Module (ALM) and Basic Line Module (BLM).
  - bb = 02 hex = 2 dec: Active Line Module (ALM) and Smart Line Module (SLM).
  - bb = 03 hex = 3 dec: SIMOTION control (e.g. SIMOTION D445) and SINUMERIK component (e.g. NX15).
  - bb = 04 hex = 4 dec: SINUMERIK control (e.g. SINUMERIK 730.net) and SIMOTION component (e.g. CX32).
- cccc: Not used.
- aa = 08 hex = 8 dec:  
The motor is not completely connected.
- bb: Not used.
- cccc: Not used.
- Note:**  
Connection type and connection number are described in F01375.

See also: p0097 (Select drive object type), r0098 (Actual device topology), p0099 (Device target topology)

**Remedy:**

- adapt the output topology to the permissible requirements.
- commission the device using the commissioning tool.
- for motors with DRIVE-CLiQ, connect the power and DRIVE-CLiQ cable to the same Motor Module (Single Motor Module: DRIVE-CLiQ at X202, Double Motor Module: DRIVE-CLiQ from motor 1 (X1) to X202, from motor 2 (X2) to X203).

For aa = 06 hex = 6 dec and bb = 01 hex = 1 dec:  
Correct the Article No. when commissioning using the commissioning tool.

---

**201331 <location>Topology: At least one component not assigned to a drive object**

**Drive object:** 'All objects

**Message value:** Component number: %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** At least one component is not assigned to a drive object.

- when commissioning, a component was not able to be automatically assigned to a drive object.
- the parameters for the data sets are not correctly set.

Alarm value (r2124, interpret decimal):  
Component number of the unassigned component.

**Remedy:** This component is assigned to a drive object.  
Check the parameters for the data sets.  
Examples:

- power unit (p0121).
- motor (p0131, p0186).
- encoder interface (p0140, p0141, p0187 ... p0189).
- encoder (p0140, p0142, p0187 ... p0189).
- Terminal Module (p0151).
- option board (p0161).

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Cause:</b>         | The device target topology (p0099) does not correspond to the device actual topology (r0098).<br>The fault only occurs if the topology was commissioned using the automatic internal device mechanism and not using the commissioning tool.<br>Fault value (r0949, interpret decimal):<br>Only for internal Siemens troubleshooting.<br>See also:r0098 (Actual device topology), p0099 (Device target topology) |

**Remedy:** One of the following counter-measures can be selected if no faults have occurred in the topology detection itself:

If commissioning is still not completed:

- carry out a self-commissioning routine (starting from p0009 = 1).

In general:

Set p0099 = r0098, set p0009 = 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107).

Generating servo drives: Set p0097 to 1, set p0009 to 0.

Generating vector drives: Set p0097 to 2, set p0009 to 0.

Generating vector drives with parallel connection: set p0097 to 12, set p0009 to 0.

In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107).

If commissioning has already been completed:

- re-establish the original connections and re-connect power to the Control Unit.
- restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again.
- change the device parameterization to match the connections (this is only possible using the commissioning tool).

Notice:

Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning tool and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting.

#### 201356 <location>Topology: There is a defective DRIVE-CLiQ component

**Drive object:** 'All objects

**Message value:** Fault cause: %1, Component number: %2, Connection number: %3

**Reaction:** NONE (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** The actual topology indicates at least one defective DRIVE-CLiQ component.

Fault value (r0949, interpret hexadecimal):

zzyyxx hex:

zz = connection number of the component at which the defective component is connected

yy = component number of the component at which the defective component is connected

xx = fault cause

xx = 1: Component at this Control Unit not permissible.

xx = 2: component with communication defect.

Note:

Pulse enable is withdrawn and prevented.

**Remedy:** Replace the defective component and restart the system.

---

#### 201357 <location>Topology: Two Control Units identified on the DRIVE-CLiQ line

**Drive object:** 'All objects

**Message value:** component number: %1, connection number: %2

**Reaction:** NONE (OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** An error was detected in the target topology.  
The target topology is invalid.  
Fault value (r0949, interpret hexadecimal):  
ccccbbaa hex: cccc = index error, bb = component number, aa = fault cause  
aa = 1B hex = 27 dec: Error not specified.  
aa = 1C hex = 28 dec: Value illegal.  
aa = 1D hex = 29 dec: Incorrect ID.  
aa = 1E hex = 30 dec: Incorrect ID length.  
aa = 1F hex = 31 dec: Too few indices left.  
aa = 20 hex = 32 dec: component not connected to Control Unit.

**Remedy:** Download the target topology again using the commissioning tool.

---

**201481 <location>Topology: power unit not connected**

**Drive object:** CU\_I\_828, CU\_I\_COMBI, CU\_LINK, CU\_NX\_828, CU\_NX\_COMBI, HLA\_828, HUB, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** Component: %1, to %2, %3, connection: %4

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The topology comparison has detected a power unit that is missing in the actual topology with respect to the target topology.  
Alarm value (r2124, interpret hexadecimal):  
ddccbbaa hex:  
dd = connection number (%4)  
cc = component number (%3)  
bb = component class (% 2)  
aa = component number of the component that has not been inserted (% 1)  
Note:  
The component is described in dd, cc and bb, where the component has not been inserted.  
Component class and connection number are described in F01375.

**Remedy:** Adapting topologies:  
- insert the components involved at the right connection (correct the actual topology).  
- adapt the project/parameterizing in the commissioning tool (correct the target topology).  
Check the hardware:  
- check the 24 V supply voltage.  
- check DRIVE-CLiQ cables for interruption and contact problems.  
- check that the component is working properly.  
Note:  
Under "Topology --> Topology view" the commissioning tool where relevant offers improved diagnostics capability (e.g. setpoint/actual value comparison).

| <b>Cause:</b>         | <p>The topology comparison has detected a Control Extension (CX32) missing in the actual topology with respect to the target topology.</p> <p>Alarm value (r2124, interpret hexadecimal):</p> <p>ddccbbaa hex:</p> <p>dd = connection number (%4)</p> <p>cc = component number (%3)</p> <p>bb = component class (% 2)</p> <p>aa = component number of the component that has not been inserted (% 1)</p> <p>Note:</p> <p>The component is described in dd, cc and bb, where the component has not been inserted.</p> <p>Component class and connection number are described in F01375.</p>                                                                                                                  |

**Remedy:** Adapting topologies:  
- insert the components involved at the right connection (correct the actual topology).  
- adapt the project/parameterizing in the commissioning tool (correct the target topology).  
Check the hardware:  
- check the 24 V supply voltage.  
- check DRIVE-CLiQ cables for interruption and contact problems.  
- check that the component is working properly.  
**Note:**  
Under "Topology --> Topology view" the commissioning tool where relevant offers improved diagnostics capability (e.g. setpoint/actual value comparison).

---

**201486 <location>Topology: DRIVE-CLiQ component not connected**

**Drive object:** 'All objects

**Message value:** Component: %1, to %2, %3, connection: %4

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The topology comparison has detected a DRIVE-CLiQ component missing in the actual topology with respect to the target topology.

Alarm value (r2124, interpret hexadecimal):

ddccbbaa hex:

dd = connection number (%4)

cc = component number (%3)

bb = component class (% 2)

aa = component number of the component that has not been inserted (% 1)

**Note:**

The component is described in dd, cc and bb, where the component has not been inserted.

Component class and connection number are described in F01375.

**Remedy:** Adapting topologies:  
- insert the components involved at the right connection (correct the actual topology).  
- adapt the project/parameterizing in the commissioning tool (correct the target topology).  
Check the hardware:  
- check the 24 V supply voltage.  
- check DRIVE-CLiQ cables for interruption and contact problems.  
- check that the component is working properly.  
**Note:**  
Under "Topology --> Topology view" the commissioning tool where relevant offers improved diagnostics capability (e.g. setpoint/actual value comparison).

| <b>Cause:</b>         | <p>The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values.</p> <p>An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different.</p> <p>Example 1:</p> <p>BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. This means that the factor p2002/p2001 is calculated between the BICO output and the BICO input.</p> <p>p2002: contains the reference value for current</p> <p>p2001: contains the reference value for voltage</p> <p>Example 2:</p> <p>BICO output with voltage normalized unit in drive object 1 (DO1), BICO input with voltage normalized unit in drive object 2 (DO2). The reference values for voltage (p2001) of the two drive objects have different values. This means that the factor p2001(DO1)/p2001(DO2) is calculated between the BICO output and the BICO input.</p> <p>p2001: contains the reference value for voltage, drive objects 1, 2</p> <p>Fault value (r0949, interpret decimal):</p> <p>Parameter number of the BICO input (signal sink).</p> |
| <b>Remedy:</b>        | Not necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Reaction:</b>    | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Acknowledge:</b> | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Cause:</b>       | During a reconnect operation (e.g. while booting or downloading - but can also occur in normal operation) a parameter was not able to be written to.<br>Example:<br>When writing to BICO input with double word format (DWORD), in the second index, the memory areas overlap (e.g. p8861). The parameter is then reset to the factory setting.<br>Alarm value (r2124, interpret decimal):<br>Parameter number of the BICO input (signal sink). |
| <b>Remedy:</b>      | Not necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Message value:</b> | %1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Reaction:</b>      | OFF2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Cause:</b>         | The drive-integrated "Safety Integrated" function on the Control Unit (CU) has detected a fault and initiated a STOP A (STO via the safety switch-off signal path of the Control Unit).<br>- forced checking procedure (test stop) of the safety switch-off signal path of the Control Unit unsuccessful.<br>- subsequent response to fault F01611 (defect in a monitoring channel).<br>Fault value (r0949, interpret decimal):<br>0: Stop request from monitoring channel 2.<br>1005: STO active although STO not selected and there is no internal STOP A present.<br>1010: STO inactive although STO is selected or an internal STOP A is present.<br>9999: Subsequent response to fault F01611. |

**Remedy:**

- select Safe Torque Off and deselect again.
- replace Hydraulic Module involved.

For fault value = 9999:

- carry out diagnostics for fault F01611.

Note:

CU: Control Unit

SI: Safety Integrated

STO: Safe Torque Off / SH: Safe standstill

## **201600 <location>SI P1 (CU): STOP A initiated**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive-integrated "Safety Integrated" function on the Control Unit (CU) has detected a fault and initiated a STOP A (STO via the safety switch-off signal path of the Control Unit).

- forced checking procedure (test stop) of the safety switch-off signal path of the Control Unit unsuccessful.

- subsequent response to fault F01611 (defect in a monitoring channel).

Fault value (r0949, interpret decimal):

0: Stop request from monitoring channel 2.

1005:

- STO active, although STO not selected and there is no internal STOP A active.

- For a Power Module with "STO via terminals at the Power Module" (STO\_A/STO\_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0).

1010: STO inactive although STO is selected or an internal STOP A is present.

1015: Feedback signal of STO for Motor Modules connected in parallel are different.

9999: Subsequent response to fault F01611.

**Remedy:**

- select Safe Torque Off and deselect again.

- replace the Motor Module involved.

For fault value = 1005:

- deactivate terminals STO\_A/STO\_B on the Power Module (set both DIP-switches to "OFF") or enable the "STO via terminals at the Power Module" function.

For fault value = 9999:

- carry out diagnostics for fault F01611.

Note:

CU: Control Unit

MM: Motor Module

SI: Safety Integrated

STO: Safe Torque Off / SH: Safe standstill

## **201611 <location>SI P1 (CU): Defect in a monitoring channel**

**Drive object:** HLA\_828

**Message value:** %1

**Reaction:** NONE (OFF1, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY (POWER ON)

- Cause:** The drive-integrated "Safety Integrated" function on processor 1 has detected a fault in the data cross-check between the two monitoring channels and has initiated a STOP F.
- As a result of this fault, after the parameterized transition has expired (p9658), fault F01600 (SI CU: STOP A initiated) is output.
- Fault value (r0949, interpret decimal):
- 0: Stop request from another monitoring channel.
- 1 ... 999:
- Number of the cross-compared data that resulted in this fault. This number is also displayed in r9795.
- 1: SI monitoring clock cycle (r9780, r9880).
- 2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits.
- 3: SI SGE changeover discrepancy time (p9650, p9850).
- 4: SI transition period STOP F to STOP A (p9658, p9858).
- 6: SI Motion enable, safety-relevant functions (p9501, internal value).
- 7: SI delay time of STO for Safe Stop 1 (p9652, p9852).
- 8: SI PROFIsafe address (p9610, p9810).
- 9: SI debounce time for STO/SBC/SS1 (p9651, p9851).
- 10: SI delay time for initiating STO for ESR (p9697, p9897).
- 11: SI HLA shutoff valve feedback signal contact configuration (p9626, p9826).
- 12: SI HLA shutoff valve wait time switch-on (p9625[0], p9825[0]).
- 13: SI HLA shutoff valve wait time switch-off (p9625[1], p9825[1]).
- 14: SI PROFIsafe telegram selection (p9611, p9811).
- 15: SI PROFIsafe bus failure response (p9612, p9812).
- 1000: Watchdog timer has expired.
- Within the time of approx. 5 x p9650, alternatively, the following was defined:
- the signal at terminal STO of the Hydraulic Module continually changed with time intervals less than or equal to the discrepancy time (p9650/p9850).
  - via PROFIsafe/TM54F, STO (also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).
- 1001, 1002: Initialization error, change timer / check timer.
- 1900: CRC error in the SAFETY sector.
- 1901: CRC error in the ITCM sector.
- 1902: Overloading in the ITCM sector has occurred in operation.
- 1903: Internal parameterizing error for CRC calculation.
- 1950: Module temperature outside the permissible temperature range.
- 1951: Module temperature not plausible.
- 2000: Status of the STO selection for both monitoring channels different.
- 2001: Feedback signal of STO shutdown for both monitoring channels different.
- 2002: Status of the delay timer SS1 for both monitoring channels different (status of the timer in p9650/p9850).
- 2003: Status of the STO terminal for both monitoring channels different.
- 6000 ... 6999:
- Error in the PROFIsafe control.
- For these fault values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9612) is parameterized, the transfer of the Failsafe Values is delayed.
- 6000: A fatal PROFIsafe communication error has occurred.
- 6064 ... 6071: error when evaluating the F parameter. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.
- 6064: Destination address and PROFIsafe address are different (F\_Dest\_Add).
- 6065: Destination address not valid (F\_Dest\_Add).
- 6066: Source address not valid (F\_Source\_Add).
- 6067: Watchdog time not valid (F\_WD\_Time).
- 6068: Incorrect SIL level (F\_SIL).
- 6069: Incorrect F-CRC length (F\_CRC\_Length).
- 6070: Incorrect F parameter version (F\_Par\_Version).

6071: CRC error for the F parameters (CRC1). The transferred CRC value of the F parameters does not match the value calculated in the PROFIsafe driver.

6072: F parameterization is inconsistent.

6165: A communications error was identified when receiving the PROFIsafe telegram. The fault may also occur if an inconsistent or out-of-date PROFIsafe telegram has been received after switching the Control Unit off and on or after plugging in the PROFIBUS/PROFINET cable.

6166: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

**Remedy:**

For fault value = 1 ... 5 and 7 ... 999:

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Hydraulic Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Hydraulic Module software.
- upgrade the Control Unit software.

For fault value = 1000:

- check the STO terminal at the Hydraulic Module (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the wiring of the failsafe inputs at the TM54F (contact problems).
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Hydraulic Module software.
- upgrade the Control Unit software.

For fault value = 1900, 1901, 1902:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Control Unit software.
- replace Control Unit.

For fault value = 2000, 2001, 2002, 2003:

- check the discrepancy time, and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check the causes of the STO selection in r9772. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace Hydraulic Module involved.

**Note:**

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

For fault value = 6000:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- increase the monitoring cycle clock settings (p9500, p9511).
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For fault value = 6064:

- check the setting of the value in the F parameter F\_Dest\_Add at the PROFIsafe slave.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the hydraulic module (p9810).

For fault value = 6065:

- check the setting of the value in the F parameter F\_Dest\_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- check the setting of the value in the F parameter F\_Source\_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!

For fault value = 6067:

- check the setting of the value in the F parameter F\_WD\_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!

For fault value = 6068:

- check the setting of the value in the F parameter F\_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!

For fault value = 6069:

- check the setting of the value in the F parameter F\_CRC\_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- check the setting of the value in the F parameter F\_Par\_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:

- check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F\_CRC\_Length and F\_Par\_Version:

F\_CRC\_Length = 2-byte CRC and F\_Par\_Version = 0

F\_CRC\_Length = 3-byte CRC and F\_Par\_Version = 1

For fault value = 6165:

- if the fault occurs after powering up the Control Unit or after plugging in the PROFIBUS/PROFINET cable, acknowledge the fault.

- check the configuration and communication at the PROFIsafe slave.

- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.

- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.

- check whether all F parameters of the drive match the F parameters of the F host.

For fault value = 6166:

- check the configuration and communication at the PROFIsafe slave.

- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.

- evaluate diagnostic information in the F host.

- check PROFIsafe connection.

- check whether all F parameters of the drive match the F parameters of the F host.

Note:

CU: Control Unit

EP: Enable Pulses (pulse enable)

ESR: Extended Stop and Retract

MM: Motor Module

SGE: Safety-relevant input

SI: Safety Integrated

SMM: Safe Motion Monitoring

SS1: Safe Stop 1 (corresponds to Stop Category 1 acc. to EN60204)

STO: Safe Torque Off / SH: Safe standstill

---

## 201611 <location>SI P1 (CU): Defect in a monitoring channel

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE (OFF1, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive-integrated "Safety Integrated" function on processor 1 has detected a fault in the data cross-check between the two monitoring channels and has initiated a STOP F.

As a result of this fault, after the parameterized transition has expired (p9658), fault F01600 (SI CU: STOP A initiated) is output.

Fault value (r0949, interpret decimal):

0: Stop request from another monitoring channel.

1 ... 999:

Number of the cross-compared data that resulted in this fault. This number is also displayed in r9795.

1: SI monitoring clock cycle (r9780, r9880).

2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits.

3: SI SGE changeover discrepancy time (p9650, p9850).

4: SI transition period STOP F to STOP A (p9658, p9858).

5: SI enable Safe Brake Control (p9602, p9802).

6: SI Motion enable, safety-relevant functions (p9501, internal value).

7: SI delay time of STO for Safe Stop 1 (p9652, p9852).

8: SI PROFIsafe address (p9610, p9810).

9: SI debounce time for STO/SBC/SS1 (p9651, p9851).

10: SI delay time for initiating STO for ESR (p9697, p9897).

11: SI Safe Brake Adapter mode, BICO interconnection (p9621, p9821).

12: SI Safe Brake Adapter relay ON time (p9622[0], p9822[0]).

13: SI Safe Brake Adapter relay OFF time (p9622[1], p9822[1]).

14: SI PROFIsafe telegram selection (p9611, p9811).

15: SI PROFIsafe bus failure response (p9612, p9812).

1000: Watchdog timer has expired.

Within the time of approx. 5 x p9650, alternatively, the following was defined:

- the signal at terminal EP of the Motor Module continually changed with time intervals less than or equal to the discrepancy time (p9650/p9850).
- via PROFIsafe/TM54F, STO (also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).
- safe pulse cancellation (r9723.9 - also as subsequent response) was continually selected and deselected with time intervals less than or equal to the discrepancy time (p9650/p9850).

1001, 1002: Initialization error, change timer / check timer.

1900: CRC error in the SAFETY sector.

1901: CRC error in the ITCM sector.

1902: Overloading in the ITCM sector has occurred in operation.

1903: Internal parameterizing error for CRC calculation.

1950: Module temperature outside the permissible temperature range.

1951: Module temperature not plausible.

2000: Status of the STO selection for both monitoring channels different.

2001: Feedback signal of STO shutdown for both monitoring channels different. This value can also subsequently occur as a result of other faults.

2002: Status of the delay timer SS1 for both monitoring channels different (status of the timer in p9650/p9850).

2003: Status of the STO terminal for both monitoring channels different.

2004: Status of the STO selection for Motor Modules connected in parallel different.

2005: Feedback signal of the safe pulse suppression on the Control Unit and Motor Modules connected in parallel different.

6000 ... 6999:

Error in the PROFIsafe control.

For these fault values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9612) is parameterized, the transfer of the Failsafe Values is delayed.

6000: A fatal PROFIsafe communication error has occurred.

6064 ... 6071: error when evaluating the F parameter. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.

6064: Destination address and PROFIsafe address are different (F\_Dest\_Add).

6065: Destination address not valid (F\_Dest\_Add).

- 6066: Source address not valid (F\_Source\_Add).
- 6067: Watchdog time not valid (F\_WD\_Time).
- 6068: Incorrect SIL level (F\_SIL).
- 6069: Incorrect F-CRC length (F\_CRC\_Length).
- 6070: Incorrect F parameter version (F\_Par\_Version).
- 6071: CRC error for the F parameters (CRC1). The transferred CRC value of the F parameters does not match the value calculated in the PROFIsafe driver.
- 6072: F parameterization is inconsistent.
- 6165: A communications error was identified when receiving the PROFIsafe telegram. The fault may also occur if an inconsistent or out-of-date PROFIsafe telegram has been received after switching the Control Unit off and on or after plugging in the PROFIBUS/PROFINET cable.
- 6166: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

**Remedy:**

For fault value = 1 ... 5 and 7 ... 999:

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1000:

- check the EP terminal at the Motor Module (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the wiring of the failsafe inputs at the TM54F (contact problems).
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1900, 1901, 1902:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Control Unit software.
- replace Control Unit.

For fault value = 2000, 2001, 2002, 2003, 2004, 2005:

- check the discrepancy time, and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check the causes of the STO selection in r9772. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace the Motor Module involved.
- diagnose the other active faults and resolve the causes.

**Note:**

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

For fault value = 6000:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- increase the monitoring cycle clock settings (p9500, p9511).
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For fault value = 6064:

- check the setting of the value in the F parameter F\_Dest\_Add at the PROFIsafe slave.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).

For fault value = 6065:

- check the setting of the value in the F parameter F\_Dest\_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- check the setting of the value in the F parameter F\_Source\_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!

For fault value = 6067:

- check the setting of the value in the F parameter F\_WD\_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!

For fault value = 6068:

- check the setting of the value in the F parameter F\_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!

For fault value = 6069:

- check the setting of the value in the F parameter F\_CRC\_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- check the setting of the value in the F parameter F\_Par\_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:

- check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F\_CRC\_Length and F\_Par\_Version:

F\_CRC\_Length = 2-byte CRC and F\_Par\_Version = 0

F\_CRC\_Length = 3-byte CRC and F\_Par\_Version = 1

For fault value = 6165:

- if the fault occurs after powering up the Control Unit or after plugging in the PROFIBUS/PROFINET cable, acknowledge the fault.

- check the configuration and communication at the PROFIsafe slave.

- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.

- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.

- check whether all F parameters of the drive match the F parameters of the F host.

For fault value = 6166:

- check the configuration and communication at the PROFIsafe slave.

- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.

- evaluate diagnostic information in the F host.

- check PROFIsafe connection.

- check whether all F parameters of the drive match the F parameters of the F host.

Note:

| <b>Reaction:</b>      | NONE (OFF1, OFF2, OFF3)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Cause:</b>         | <p>The drive-integrated "Safety Integrated" function on the Control Unit (CU) has identified different states of the AND'ed STO inputs for power units connected in parallel and has initiated a STOP F.</p> <p>As a result of this fault, after the parameterized transition has expired (p9658), fault F01600 (SI CU: STOP A initiated) is output.</p> <p>Fault value (r0949, interpret binary):</p> <p>Binary image of the digital inputs of the Control Unit that are used as signal source for the function "Safe Torque Off".</p> |

**Remedy:**

- check the tolerance time SGE changeover and if required, increase the value (p9650).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).

**Note:**

CU: Control Unit

SGE: Safety-relevant input

SI: Safety Integrated

STO: Safe Torque Off / SH: Safe standstill

---

**201620 <location>SI P1 (CU): Safe Torque Off active**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The "Safe Torque Off" (STO) function of the basic functions has been selected on the Control Unit (CU) using the input terminal and is active.

**Note:**

- this message does not result in a safety stop response.

- this message is not output when STO is selected using the Extended Functions.

**Remedy:** Not necessary.

**Note:**

CU: Control Unit

SI: Safety Integrated

STO: Safe Torque Off / SH: Safe standstill

---

**201621 <location>SI P1 (CU): Safe Stop 1 active**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The "Safe Stop 1" (SS1) function has been selected on the Control Unit (CU) and is active.

**Note:**

This message does not result in a safety stop response.

**Remedy:** Not necessary.

**Note:**

CU: Control Unit

SI: Safety Integrated

SS1: Safe Stop 1

---

**201625 <location>SI P1 (CU): Sign-of-life error in safety data**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive-integrated "Safety Integrated" function on the Control Unit (CU) has detected an error in the sign-of-life of the safety data between the two monitoring channels and has initiated a STOP A.

- there is either a DRIVE-CLiQ communication error or communication has failed.

- a time slice overflow of the safety software has occurred.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

- Remedy:**
- select STO and then deselect again.
  - carry out a POWER ON (switch-off/switch-on) for all components.
  - check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
  - deselect all drive functions that are not absolutely necessary.
  - reduce the number of drives.
  - check the electrical cabinet design and cable routing for EMC compliance
- Note:**
- CU: Control Unit  
MM: Motor Module  
SI: Safety Integrated  
STO: Safe Torque Off

## 201630 <location>SI P1 (CU): Brake control error

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive-integrated "Safety Integrated" function on the Control Unit (CU) has detected a brake control fault and initiated a STOP A.

- motor cable is not shielded correctly.
- defect in the brake control circuit of the Motor Module.

Fault value (r0949, interpret decimal):

10, 11:

Fault in "open holding brake" operation.

- parameter p1278 incorrectly set.
- no brake connected or wire breakage (check whether brake releases for p1278 = 1 and p9602/p9802 = 0 (SBC deactivated)).
- ground fault in brake cable.

20:

Fault in "brake open" state.

- short-circuit in brake winding.

30, 31:

Fault in "close holding brake" operation.

- no brake connected or wire breakage (check whether brake releases for p1278 = 1 and p9602/p9802 = 0 (SBC deactivated)).
- short-circuit in brake winding.

40:

Fault in "brake closed" state.

50:

Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control diagnostics).

80:

Safe Brake Adapter.

Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control diagnostics).

90:

Brake released for service purposes (X4).

**Remedy:**

- check parameter p1278 (for SBC, only p1278 = 0 is permissible).
- for a parallel connection, check the setting of the power unit data set to control the holding brake (p7015).
- select Safe Torque Off and deselect again.
- check the motor holding brake connection.
- check the function of the motor holding brake.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).
- replace the Motor Module involved.

Operation with Safe Brake Module or Safe Brake Adapter:

- check the Safe Brake Module or Safe Brake Adapter connection.
- Replace the Safe Brake Module or Safe Brake Adapter.

Note:

CU: Control Unit  
SBC: Safe Brake Control  
SI: Safety Integrated

---

**201631 <location>SI P1 (CU): motor holding brake/SBC configuration not practical**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A configuration of motor holding brake and SBC was detected that is not practical.

The following configurations can result in this message:

- "No motor holding brake available" (p1215 = 0) and "SBC" enabled (p9602 = 1).
- "Motor holding brake just like the sequence control, connection via BICO" (p1215 = 3) and "SBC" enabled (p9602 = 1).

**Remedy:** Check the parameterization of the motor holding brake and SBC and correct.

Note:

SBC: Safe Brake Control

See also: p1215 (Motor holding brake configuration), p9602 (SI enable Safe Brake Control (Control Unit)), p9802 (SI enable Safe Brake Control (Motor Module))

| <b>Cause:</b>         | <p>"Safety Integrated" has identified that a component has been replaced.</p> <p>It is no longer possible to operate the particular drive without fault.</p> <p>When safety functions are active, after a component has been replaced it is necessary to carry out a partial acceptance test.</p> <p>Fault value (r0949, interpret binary):</p> <p>Bit 0 = 1:<br/>It has been identified that the Control Unit has been replaced.</p> <p>Bit 1 = 1:<br/>It has been identified that the Motor Module/Hydraulic Module has been replaced.</p> <p>Bit 2 = 1:<br/>It has been identified that the Power Module has been replaced.</p> <p>Bit 3 = 1:<br/>It has been identified that the Sensor Module channel 1 has been replaced.</p> <p>Bit 4 = 1:<br/>It has been identified that the Sensor Module channel 2 has been replaced.</p> <p>Bit 5 = 1:<br/>It has been identified that the sensor channel 1 has been replaced.</p> <p>Bit 6 = 1:<br/>It has been identified that sensor channel 2 has been replaced.</p> |

**Remedy:**

- acknowledge component replacement (p9702 = 29).
- save all parameters (p0977 = 1 or p0971 = 1 or "copy RAM to ROM").
- acknowledge fault (e.g. binector input p2103).

**Note:**

In addition to the fault, diagnostics bits r9776.2 and r9776.3 are set.

---

**201640 <location>SI P1 (CU): component replacement identified and acknowledgment/save required**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:**

"Safety Integrated" has identified that a component has been replaced.

Replacing the component means that the "Global checksum" of the "Safety-relevant hardware" is changed. It is no longer possible to operate the particular drive without fault.

When safety functions are active, after a component has been replaced it is necessary to carry out a partial acceptance test.

Fault value (r0949, interpret binary):

Bit 0 = 1:  
It has been identified that the Control Unit has been replaced.

Bit 1 = 1:  
It has been identified that the Motor Module/Hydraulic Module has been replaced.

Bit 2 = 1:  
It has been identified that the Power Module has been replaced.

Bit 3 = 1:  
It has been identified that the Sensor Module channel 1 has been replaced.

Bit 4 = 1:  
It has been identified that the Sensor Module channel 2 has been replaced.

Bit 5 = 1:  
It has been identified that the sensor channel 1 has been replaced.

Bit 6 = 1:  
It has been identified that sensor channel 2 has been replaced.

**Remedy:**

- acknowledge component replacement (p9702 = 29).
- save all parameters (p0977 = 1 or p0971 = 1 or "copy RAM to ROM").
- acknowledge fault (e.g. binector input p2103).

**Note:**

In addition to the fault, diagnostics bits r9776.2 and r9776.3 are set.

- Cause:** The drive-integrated "Safety Integrated" function on monitoring channel 1 requires an acceptance test.
- Note:**  
 This fault results in a STOP A that can be acknowledged.  
 Fault value (r0949, interpret decimal):  
 130: Safety parameters for monitoring channel 2 not available.
- Note:**  
 This fault value is always output when Safety Integrated is commissioned for the first time.  
 1000: Reference and actual checksum on monitoring channel 1 are not identical (booting).  
 - as a result of the changed current controller sampling time (p0115[0]), the clock cycle time for the Safety Integrated Basic Functions (r9780) was adapted.  
 - at least one checksum-checked piece of data is defective.  
 - safety parameters set offline and loaded into the Control Unit.  
 2000: Reference and actual checksum on monitoring channel 1 are not identical (commissioning mode).  
 - reference checksum on monitoring channel 1 incorrectly entered (p9799 not equal to r9798).  
 - when deactivating the safety functions, p9501 or p9503 were not deleted.  
 2001: Reference and actual checksum on monitoring channel 2 are not identical (commissioning mode).  
 - reference checksum on monitoring channel 2 incorrectly entered (p9899 not equal to r9898).  
 - when deactivating the safety functions, p9501 or p9503 are not deleted.  
 2002: Enable of safety-related functions between the two monitoring channels differ (p9601 not equal to p9801).  
 2003: Acceptance test is required as a safety parameter has been changed.  
 2004: An acceptance test is required because a project with enabled safety-functions has been downloaded.  
 2005: The Safety logbook has identified that a functional safety checksum has changed. An acceptance test is required.  
 2010: Enable of safety-related brake control between the two monitoring channels differ (p9602 not equal to p9802).  
 2020: Error when saving the safety parameters for the monitoring channel 2.  
 3003: Acceptance test is required as a hardware-related safety parameter has been changed.  
 3005: The Safety logbook has identified that a hardware-related safety checksum has changed. An acceptance test is required.  
 9999: Subsequent response of another safety-related fault that occurred when booting that requires an acceptance test.

**Remedy:**

For fault value = 130:

- carry out safety commissioning routine.

For fault value = 1000:

- check the Safety Integrated Basic Functions (r9780) and adapt the reference checksum (p9799).
- again carry out safety commissioning routine.
- replace the memory card or Control Unit.
- Using STARTER, activate the safety parameters for the drive involved (change settings, copy parameters, activate settings).

For fault value = 2000:

- check the safety parameters on monitoring channel 1 and adapt the reference checksum (p9799).

For fault value = 2001:

- check the safety parameters on monitoring channel 2 and adapt the reference checksum (p9899).

For fault value = 2002:

- check the enable the safety-related functions on both monitoring channels (p9601 = p9801).

For fault value = 2003, 2004, 2005:

- carry out an acceptance test and generate an acceptance report.

The procedure when carrying out an acceptance test as well as an example of the acceptance report are provided in the following literature:

SINAMICS S120 Function Manual Safety Integrated

Note:

The fault with fault value 2005 can only be acknowledged when the "STO" function is deselected.

For fault value = 2010:

- check the enable the safety-related brake control on both monitoring channels (p9602 = p9802).

For fault value = 2020:

- again carry out safety commissioning routine.
- replace the memory card or Control Unit.

For fault value = 3003:

- carry out the function checks for the modified hardware and generate an acceptance report.

The procedure when carrying out an acceptance test as well as an example of the acceptance report are provided in the following literature:

SINAMICS S120 Function Manual Safety Integrated

For fault value = 3005:

- carry out the function checks for the modified hardware and generate an acceptance report.

The fault with fault value 3005 can only be acknowledged when the "STO" function is deselected.

For fault value = 9999:

- carry out diagnostics for the other safety-related fault that is present.

Note:

CU: Control Unit

MM: Motor Module

SI: Safety Integrated

STO: Safe Torque Off

**Cause:**

One of the Safety Integrated monitoring clock cycles is not permissible.

- the monitoring clock cycle integrated in the drive cannot be maintained due to the communication conditions required in the system.
- the monitoring clock cycle for safe motion monitoring functions is not permissible (p9500).
- the actual value sensing clock cycle for safe motion monitoring functions is not permissible (p9511).
- the sampling time for the current controller (p0112, p0115[0]) cannot be supported.

**Note:**

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

For motion monitoring functions that are not enabled (p9601.2 = p9801.2 = 0, p9501 = 0), the following applies:

- Minimum setting for the monitoring clock cycle (in  $\mu$ s).

For motion monitoring functions that are enabled (p9601.2 = p9801.2 = 1 and/or p9501 > 0), the following applies:

100:

- no matching monitoring clock cycle was able to be found.
- an illegal actual value sensing clock cycle was set for S120M (p9511).

101:

- the monitoring clock cycle is not an integer multiple of the actual value sensing clock cycle.

102:

- An error has occurred when transferring the actual value sensing clock cycle to the Hydraulic Module.

103:

- An error has occurred when transferring the actual value sensing clock cycle to the Sensor Module.

104, 105:

- four times the current controller sampling time (p0115[0]) is greater than 1 ms when operating with a non-isochronous PROFIBUS.

- four times the current controller sampling time (p0115[0]) is greater than the DP clock cycle when operating with an isochronous PROFIBUS.

- the DP clock cycle is not an integer multiple of the sampling time of the current controller (p0115[0]).

106:

- the monitoring clock cycle does not match the monitoring clock cycle of the TM54F.

107:

- the actual value sensing clock cycle (p9511) is less than four times the current controller sampling time (p0115[0]).
- the actual value sensing clock cycle (p9511) is not an integer multiple of the sampling time of the current controller (p0115[0]).

108:

- the parameterized actual value sensing clock cycle cannot be set on this component

111:

- the monitoring clock cycle is not an integer multiple of the sampling time of the current controller (p0115[0]).

112:

- an actual value sensing clock cycle p9511 = 0 is not permissible in this configuration.

202:

- the current controller sampling time is set to zero (p0115[0]).

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Drive object:</b>  | SERVO_828, SERVO_COMBI                                            |
| <b>Message value:</b> | %1                                                                |
| <b>Reaction:</b>      | OFF2                                                              |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                            |

**Cause:**

One of the Safety Integrated monitoring clock cycles is not permissible.

- the monitoring clock cycle integrated in the drive cannot be maintained due to the communication conditions required in the system.
- the monitoring clock cycle for safe motion monitoring functions is not permissible (p9500).
- the actual value sensing clock cycle for safe motion monitoring functions is not permissible (p9511).
- the sampling time for the current controller (p0112, p0115[0]) cannot be supported.

**Note:**

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

For motion monitoring functions that are not enabled (p9601.2 = p9801.2 = 0, p9501 = 0), the following applies:

- Minimum setting for the monitoring clock cycle (in  $\mu$ s).

For motion monitoring functions that are enabled (p9601.2 = p9801.2 = 1 and/or p9501 > 0), the following applies:

100:

- no matching monitoring clock cycle was able to be found.
- an illegal actual value sensing clock cycle was set for S120M (p9511).

101:

- the monitoring clock cycle is not an integer multiple of the actual value sensing clock cycle.
- SINAMICS S120M: the monitoring clock cycle (p9500) is not an integer multiple of 2 ms.

102:

- An error has occurred when transferring the actual value sensing clock cycle to the Motor Module.

103:

- An error has occurred when transferring the actual value sensing clock cycle to the Sensor Module.

104, 105:

- four times the current controller sampling time (p0115[0]) is greater than 1 ms when operating with a non-isochronous PROFIBUS.
- four times the current controller sampling time (p0115[0]) is greater than the DP clock cycle when operating with an isochronous PROFIBUS.
- the DP clock cycle is not an integer multiple of the sampling time of the current controller (p0115[0]).

106:

- the monitoring clock cycle does not match the monitoring clock cycle of the TM54F.

107:

- the actual value sensing clock cycle (p9511) is less than four times the current controller sampling time (p0115[0]).
- the actual value sensing clock cycle (p9511) is not an integer multiple of the sampling time of the current controller (p0115[0]).

108:

- the parameterized actual value sensing clock cycle cannot be set on this component

109:

- if the motion monitoring functions have been parameterized as encoderless (p9506), the actual value sensing clock cycle (p9511) and the current controller clock cycle (p0115[0]) must be identical.
- SINAMICS S110: if the motion monitoring functions have been parameterized as encoderless (p9506), the actual value sensing clock cycle p9511 must be = 250  $\mu$ s.

110:

- the actual value sensing clock cycle (p9511) for safety with encoder (p9506 = 0) is less than 2 ms for this Control Unit (e.g. CU305).

111:

- the monitoring clock cycle is not an integer multiple of the sampling time of the current controller (p0115[0]).

112:

- An actual value sensing clock cycle p9511 = 0 on a drive object of a Double Motor Module is not permissible in the existing configuration.

200, 201:

- S120M: the monitoring clock cycle cannot be maintained as a result of the conditions required in the system.

202:

- the current controller sampling time is set to zero (p0115[0]).

- Remedy:**
- For enabled SI monitoring integrated in the drive (p9601/p9801 > 0):
    - upgrade the firmware of the Control Unit to a later version.
  - For enabled motion monitoring function (p9501 > 0):
    - correct the monitoring clock cycle (p9500) and carry out POWER ON.
  - For fault value = 100:
    - for S120M, set the actual value sensing clock cycle to p9511 = 0.
  - For fault value = 101:
    - actual value sensing clock cycle corresponds to position control clock cycle/DP clock cycle (factory setting).
    - for motion monitoring functions integrated in the drive (p9601/p9801 bit 2 = 1) the actual value sensing clock cycle can be directly parameterized in p9511/p9311.
    - SINAMICS S120M: set the monitoring clock cycle (p9500) to an integer multiple of 2 ms.
  - For fault value = 104, 105:
    - set a separate actual value sensing clock cycle in p9511.
    - restrict operation to a maximum of two vector drives. For the standard setting in p0112, p0115, the current controller sampling time is automatically reduced to 250 µs. If the standard values were changed, then the current controller sampling time (p0112, p0115) should be appropriately set.
    - increase the DP clock cycle for operation with an isochronous PROFIBUS so that there is a multiple clock cycle ratio of at least 4:1 between the DP clock cycle and the current controller sampling time. A clock cycle ratio of at least 8:1 is recommended.
    - With firmware version 2.5, please ensure that parameter p9510 is set to 1 in the drive (clock cycle synchronous operation).
  - For fault value = 106:
    - set the parameters for the monitoring clock cycles the same (p10000 and p9500/p9300).
  - For fault value = 107:
    - set an actual value sensing clock cycle that matches the current controller clock cycle ( $p9511 \geq 4 * p0115[0]$ ,  $8 * p0115[0]$  is recommended).
  - Note:
 

An actual value sensing clock cycle (p9511) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.
  - For fault value = 108:
    - set a suitable actual value sensing clock cycle in p9511.
    - if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then p9511 must be set to the required actual value sensing clock cycle (< 8 ms).
    - For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.
  - For fault value = 109:
    - set the actual value sensing clock cycle in p9511 to the same value as the current controller clock cycle (p0115[0]).
    - SINAMICS S110: set the actual value sensing clock cycle to p9511 = 250 µs.
  - For fault value = 110:
    - set the actual value sensing clock cycle in p9511 to 2 ms or higher.
  - For fault value = 111:
    - set the monitoring clock cycle in p9500 as an integer multiple of the sampling time of the current controller (p0115[0]).
  - For fault value = 112:
    - set the actual value sensing clock cycle p9511 to the required value (not equal to zero).
  - For fault value = 200, 201:
    - increase the current controller sampling time (p0115[0]).
    - if required, reduce the number of components connected to the corresponding DRIVE-CLiQ line, or distribute the components across several DRIVE-CLiQ sockets.
  - For fault value = 202:
    - set the current controller sampling time to a sensible value (p0115[0]).
  - Note:
 

CU: Control Unit

**201653 <location>SI P1 (CU): PROFIBUS/PROFINET configuration error****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** NONE (OFF1, OFF2, OFF3)**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** There is a PROFIBUS/PROFINET configuration error for using Safety Integrated monitoring functions with a higher-level control (SINUMERIK or F-PLC).**Note:**

For safety functions that have been enabled, this fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

200: A safety slot for receive data from the control has not been configured.

210, 220: The configured safety slot for the receive data from the control has an unknown format.

230: The configured safety slot for the receive data from the F-PLC has the incorrect length.

231: The configured safety slot for the receive data from the F-PLC has the incorrect length.

240: The configured safety slot for the receive data from the SINUMERIK has the incorrect length.

250: A PROFIsafe slot is configured in the higher-level F control, however PROFIsafe is not enabled in the drive.

300: A safety slot for the send data to the control has not been configured.

310, 320: The configured safety slot for the send data to the control has an unknown format.

330: The configured safety slot for the send data to the F-PLC has the incorrect length.

331: The configured safety slot for the send data to the F-PLC has the incorrect length.

340: The configured safety slot for the send data to the SINUMERIK has the incorrect length.

400: The telegram number in the F-PLC does not match the parameterization in the drive.

**Remedy:** The following generally applies:

- check and, if necessary, correct the PROFIBUS/PROFINET configuration of the safety slot on the master side.
- upgrade the Control Unit software.

For fault value = 250:

- remove the PROFIsafe configuring in the higher-level F control or enable PROFIsafe in the drive.

For fault value = 231, 331:

- in the drive, parameterize the appropriate PROFIsafe telegram (p9611/p9811) to be set on the F-PLC and to be set in p60022.

- Configure the PROFIsafe telegram matching the parameterization (p9611/p9811) in the F-PLC.
- 

**201654 <location>SI P1 (CU): Deviating PROFIsafe configuration****Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** The configuration of a PROFIsafe telegram in the higher-level control (F-PLC) does not match the parameterization in the drive.**Note:**

This message does not result in a safety stop response.

Alarm value (r2124, interpret decimal):

1:

A PROFIsafe telegram is configured in the higher-level control, however PROFIsafe is not enabled in the drive (p9601.3).

2:

PROFIsafe is parameterized in the drive; however, a PROFIsafe telegram has not been configured in the higher-level control.

- Remedy:** The following generally applies:
- check and, if necessary, correct the PROFIsafe configuration in the higher-level control.
- For alarm value = 1:
- remove the PROFIsafe configuring in the higher-level F control or enable PROFIsafe in the drive.
- For alarm value = 2:
- configure the PROFIsafe telegram to match the parameterization in the higher-level F-control.

---

## 201655 <location>SI P1 (CU): Align monitoring functions

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** An error has occurred when aligning the Safety Integrated monitoring functions of both monitoring channels. No common set of supported SI monitoring functions was able to be determined.

- there is either a DRIVE-CLiQ communication error or communication has failed.
- Safety Integrated software releases on the Control Unit and Motor Module/Hydraulic Module are not compatible with one another.

**Note:**

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret hexadecimal):

Only for internal Siemens troubleshooting.

- Remedy:**
- carry out a POWER ON (switch-off/switch-on) for all components.
  - upgrade the Motor Module/Hydraulic Module software.
  - upgrade the Control Unit software.
  - check the electrical cabinet design and cable routing for EMC compliance

**Note:**

CU: Control Unit

SI: Safety Integrated

---

## 201656 <location>SI CU: Parameter monitoring channel 2 error

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** When accessing the Safety Integrated parameters for monitoring channel 2 in the non-volatile memory, an error has occurred.

**Note:**

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

129:

- safety parameters for monitoring channel 2 corrupted.
- drive with enabled safety functions was possibly copied offline using the commissioning tool and the project downloaded.

131: Internal Motor Module/Hydraulic Module software error.

132: Communication errors when uploading or downloading the safety parameters for monitoring channel 2.

255: Internal software error on the Control Unit.

**Remedy:**

- re-commission the safety functions.
- upgrade the Control Unit software.
- upgrade the Motor Module/Hydraulic Module software.
- replace the memory card or Control Unit.

For fault value = 129:

- activate the safety commissioning mode (p0010 = 95).
- adapt the PROFIsafe address (p9610).
- start the copy function for SI parameters (p9700 = D0 hex).
- acknowledge data change (p9701 = DC hex).
- exit the safety commissioning mode (p0010 = 0).
- save all parameters (p0977 = 1 or "copy RAM to ROM").
- carry out a POWER ON (switch-off/switch-on) for all components.

For fault value = 132:

- check the electrical cabinet design and cable routing for EMC compliance

**Note:**  
CU: Control Unit  
SI: Safety Integrated

---

**201657 <location>SI P1 (CU): PROFIsafe telegram number invalid**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** The PROFIsafe telegram number set in p9611 is not valid.  
When PROFIsafe is enabled (p9601.3 = 1), then a telegram number greater than zero must be entered in p9611.  
**Note:**

This fault does not result in a safety stop response.

See also: p9611 (SI PROFIsafe telegram selection (Control Unit)), p60022 (PROFIsafe telegram selection)

**Remedy:** Check the telegram number setting (p9611).

---

**201658 <location>SI P1 (CU): PROFIsafe telegram number differ**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The PROFIsafe telegram number is set differently in p9611 and p60022.  
For p9611 not equal to 998, the following applies:  
The telegram number must be identically set in both parameters.  
The following applies for p9611 = 998:  
As a result of the compatibility to firmware versions < 4.5, then only the values 0 and 30 are permitted in p60022.  
**Note:**

This fault does not result in a safety stop response.

See also: p9611 (SI PROFIsafe telegram selection (Control Unit)), p60022 (PROFIsafe telegram selection)

**Remedy:** Match the telegram number in both parameters so that they are the same (p9611, p60022).

---

**201659 <location>SI P1 (CU): Write request for parameter rejected**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

- Cause:** The write request for one or several Safety Integrated parameters on the Control Unit (CU) was rejected.
- Note:**  
This fault does not result in a safety stop response.  
Fault value (r0949, interpret decimal):
- 1: The Safety Integrated password is not set.
  - 2: A reset of the drive parameters was selected. However, the Safety Integrated parameters were not reset, as Safety Integrated is presently enabled.
  - 3: The interconnected STO input is in the simulation mode.
  - 10: An attempt was made to enable the STO function although this cannot be supported.
  - 11: An attempt was made to enable the SBC function although this cannot be supported.
  - 12: An attempt was made to enable the SBC function although this cannot be supported for a parallel circuit configuration (r9871.14).
  - 13: An attempt was made to enable the SS1 function although this cannot be supported.
  - 14: An attempt was made to enable the PROFIsafe communication - although this cannot be supported or the version of the PROFIsafe driver used on both monitoring channels is different.
  - 15: An attempt was made to enable the motion monitoring functions integrated in the drive although these cannot be supported.
  - 16: An attempt was made to enable the STO function although this cannot be supported when the internal voltage protection (p1231) is enabled.
  - 17: An attempt was made to enable the PROFIsafe function although this cannot be supported for a parallel circuit configuration.
  - 18: An attempt was made to enable the PROFIsafe function for Basic Functions although this cannot be supported.
  - 19: An attempt was made to enable the SBA (Safe Brake Adapter), although this cannot be supported.
  - 20: An attempt was made to enable the motion monitoring functions integrated in the drive and the STO function, both controlled via F-DI.
  - 21: An attempt was made to enable the motion monitoring functions integrated in the drive for a parallel connection, although these cannot be supported.
  - 22: An attempt was made to enable the Safety Integrated Functions although these cannot be supported by the connected Power Module.
  - 23: For ESR, an attempt was made to enable the delay of STO, although this cannot be supported.
  - 24: An attempt was made to enable the SBC function, although no power unit data set is set for the brake control (p7015 = 99).
  - 25: An attempt was made to parameterize a PROFIsafe telegram although this cannot be supported.
  - 26: With the selected signal source for STO/SS1, an attempt was made to activate the simulation mode.
  - 27: An attempt was made to activate the Basic Functions by controlling via TM54F although this is not supported.
  - 28: An attempt was made to enable the "STO via terminals at the Power Module" function although this cannot be supported.
  - 29: An attempt was made to parameterize the STOP B as stop response for PROFIsafe failure, although this cannot be supported.
  - 9612: An attempt was made to parameterize STOP B as stop response for PROFIsafe failure, although PROFIsafe is not enabled.
- See also: p0970, p3900, p9612, r9771, r9871

**Remedy:**

For fault value = 1:

- set the Safety Integrated password (p9761).

For fault value = 2:

- inhibit Safety Integrated (p9501, p9601) or reset safety parameters (p0970 = 5), then reset the drive parameters again.

For fault value = 3:

- end the simulation mode for the digital input (p0795).

For fault value = 10, 11, 12, 13, 14, 15, 17, 18, 19, 21, 22, 23, 27:

- check whether there are faults in the safety function alignment between the two monitoring channels (F01655, F30655) and if required, carry out diagnostics for the faults involved.
- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 16:

- inhibit the internal voltage protection (p1231).

For fault value = 20:

- correct the enable setting (p9601).

For fault value = 22:

- use a Power Module that supports the Safety Integrated Functions.

For fault value = 24:

- set the power unit data set for the holding brake (p7015).

For fault value = 25:

- use a Power Module that supports the PROFIsafe telegram selection.
- correct the telegram number setting (p9611).

For fault value = 26:

- deactivate the simulation mode for the set signal source for STO/SS1 (p9620) (p0795).

For fault value = 28:

- use the power unit with the feature "STO via terminals at the Power Module".

For fault value = 29:

- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.
- if required, parameterize the stop response for PROFIsafe failure to STOP A (p9612 = p9812 = 0).

For fault value = 33:

- deselect drive integrated motion monitoring without selection (p9601.5, p9801.5) and select safety functions that are supported (see p9771/p9871).
- use a Motor Module that supports the required function.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 9612:

- establish communications with PROFIsafe (p9601).
- parameterize STOP A as the stop response for PROFIsafe failure (p9612 = 0).

Note:

CU: Control Unit

ESR: Extended Stop and Retract

F-DI: Failsafe Digital Input

SBA: Safe Brake Adapter

SBC: Safe Brake Control

SI: Safety Integrated

SS1: Safe Stop 1

STO: Safe Torque Off / SH: Safe standstill

| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Cause:</b>         | <p>The write request for one or several Safety Integrated parameters on the Control Unit (CU) was rejected.</p> <p><b>Note:</b></p> <p>This fault does not result in a safety stop response.</p> <p>Fault value (r0949, interpret decimal):</p> <p>1: The Safety Integrated password is not set.</p> <p>2: A reset of the drive parameters was selected. However, the Safety Integrated parameters were not reset, as Safety Integrated is presently enabled.</p> <p>27: An attempt was made to activate the Basic Functions by controlling via TM54F although this is not supported.</p> <p>See also: p0970, p3900, p9612, r9771, r9871</p> |

**Remedy:**

- For fault value = 1:
  - set the Safety Integrated password (p10061).
- For fault value = 2:
  - inhibit Safety Integrated (p9501, p9601) or reset safety parameters (p0970 = 5), then reset the drive parameters again.
- For fault value = 27:
  - check whether there are faults in the safety function alignment between the Control Unit and the Motor Module involved (F01655, F30655) and if required, carry out diagnostics for the faults involved.
  - use Motor Modules that supports the required function.
  - upgrade the Motor Module software.
  - upgrade the Control Unit software.

### 201660 <location>SI P1 (CU): Safety-related functions not supported

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The Motor Module/Hydraulic Module does not support the safety-related functions (e.g. the Motor Module/Hydraulic Module version is not the correct one). Safety Integrated cannot be commissioned.

**Note:**

This fault does not result in a safety stop response.

**Remedy:**

- use a Motor Module/Hydraulic Module that supports the safety-related functions.
- upgrade the Motor Module/Hydraulic Module software.

**Note:**

CU: Control Unit

SI: Safety Integrated

### 201663 <location>SI P1 (CU): Copying the SI parameters rejected

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** In p9700, the value 87 or 208 is saved or was entered offline.

This is the reason that when booting, an attempt is made to copy Safety Integrated parameters from monitoring channel 1 to monitoring channel 2. However, no safety-relevant function has been selected in monitoring channel 1 (p9501 = 0, p9601 = 0). Copying was rejected for safety reasons.

As a consequence, inconsistent parameterization can occur in both monitoring channels, which in turn results in additional error messages.

Especially for inconsistent enabling of the safety functions on both monitoring channels (p9601 = 0, p9801 <> 0), fault F30625 is output.

**Note:**

This fault does not result in a safety stop response.

SI: Safety Integrated

See also: p9700 (SI Motion copy function)

- Remedy:**
- set p9700 to 0.
  - check p9501 and p9601 and if required, correct.
  - restart the copying function by entering the corresponding value into p9700.
- Alternatively, using the STARTER commissioning tool, perform the following steps in the online mode:
- call the "Safety Integrated" screen form (the field "Select safety functions" is at "No Safety Integrated").
  - click on "Change settings".
  - click on "Activate settings" (as a consequence, Safety Integrated is inhibited on both monitoring channels).
  - save all parameters (p0977 = 1 or "copy RAM to ROM").
  - carry out a POWER ON (switch-off/switch-on) for all components.

---

**201664 <location>SI P1 (CU): No automatic firmware update**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** During booting, the system detected that the "Firmware update automatic" function (p7826 = 1) was not activated. This function must be activated for automatic firmware updates/downgrades to prevent impermissible version combinations when safety functions are enabled.

**Note:**

This fault does not result in a safety stop response.

See also: p7826 (Firmware update automatic)

**Remedy:** When safety functions are enabled (p9501  $\neq$  0 and/or p9601  $\neq$  0):

1. Activate the "Firmware update automatic" function (p7826 = 1).

2. Backup the parameters (p0977 = 1) and carry out a POWER ON.

When deactivating the safety functions (p9501 = 0, p9601 = 0), the fault can be acknowledged after exiting the safety commissioning mode.

**201665 <location>SI P1 (CU): System is defective**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A system defect was detected before the last boot or in the actual one. The system might have been rebooted (reset).

Fault value (r0949, interpret hexadecimal):

200000 hex, 400000 hex, 8000yy hex (yy any):

- fault in the actual booting/operation.

800004 hex:

- parameters p9500/p9300 are, under certain circumstances, not the same. In addition, Safety message C01711/C30711 is displayed.

Additional values:

- defect before the last time that the system booted.

**Remedy:** - carry out a POWER ON (switch-off/switch-on).

- upgrade firmware to later version.

- contact Technical Support.

For fault value = 200000 hex, 400000 hex, 8000yy hex (yy any):

- ensure that the Control Unit is connected to the Power Module.

For fault value = 800004 hex:

- check that parameters p9500/p9300 are the same.

**Note:**

| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Cause:</b>         | <p>The existing Motor Module software does not support safe motion monitoring or is not compatible to the software on the Control Unit or there is a communications error between the Control Unit and Motor Module.</p> <p>Note:</p> <p>This fault results in a STOP A that cannot be acknowledged.</p> <p>Fault value (r0949, interpret decimal):</p> <p>1:</p> <p>The existing Motor Module software does not support the safe motion monitoring function.</p> <p>2, 3, 6, 8:</p> <p>There is a communications error between the Control Unit and Motor Module.</p> <p>4, 5, 7:</p> <p>The existing Motor Module software is not compatible to the software on the Control Unit.</p> <p>9, 10, 11, 12:</p> <p>The existing Motor Module software does not support the safe encoderless motion monitoring function.</p> <p>13:</p> <p>At least one Motor Module in parallel operation does not support the safe motion monitoring function.</p> |

**Remedy:**

- check whether there are faults in the safety function alignment between the Control Unit and the Motor Module involved (F01655, F30655) and if required, carry out diagnostics for the faults involved.

For fault value = 1:

- use a Motor Module that supports safe motion monitoring.

For fault value = 2, 3, 6, 8:

- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

For fault value = 4, 5, 7, 9, 13:

- upgrade the Motor Module software.

Note:

SI: Safety Integrated

---

**201673 <location>SI Motion: Sensor Module software/hardware incompatible**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The existing Sensor Module software and/or hardware does not support the safe motion monitoring function with the higher-level control.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:**

- upgrade the Sensor Module software.
- use a Sensor Module that supports the safe motion monitoring function.

Note:

SI: Safety Integrated

---

**201674 <location>SI Motion P1 (CU): Safety function not supported by PROFIsafe telegram**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** POWER ON

**Cause:** The monitoring function enabled in p9501 and p9601 is not supported by the currently set PROFIsafe telegram (p9611).

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret bitwise binary):

Bit 4 = 1:

SS2ESR via PROFIsafe is not supported (p9501.4).

Bit 18 = 1:

SS2E via PROFIsafe is not supported (p9501.18).

Bit 24 = 1:

Transfer SLS (SG) limit value via PROFIsafe not supported (p9501.24).

Bit 25 = 1:

Transfer safe position (SP) via PROFIsafe is not supported (p9501.25).

Bit 26 = 1:

Gearbox stage switchover via PROFIsafe is not supported (p9501.26).

Bit 28 = 1:

SCA via PROFIsafe is not supported (p9501.28).

**Remedy:**

- Deselect the monitoring function involved (p9501, p9601).
- set the matching PROFIsafe telegram (p9611).

**Note:**

SCA: Safe Cam  
 SI: Safety Integrated  
 SLS: Safely-Limited Speed / SG: Safely reduced speed  
 SP: Safe Position  
 SS2E: Safe Stop 2 External (Safe Stop 2 with external stop, external STOP D)  
 SS2ESR: Safe Stop 2 Extended Stop and Retract

### 201675 <location>SI Motion P1: settings in the PROFIBUS/PROFINET controller not permissible

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** For the "Safe synchronous position via PROFIsafe" function, an incorrect configuration setting was identified.

**Note:**

This fault results in a STOP A that can be acknowledged in the following way.

- select STO and then deselect again.
- internal event acknowledge (if the "Extended message acknowledgment" is active, p9507.0 = 1).

Fault value (r0949, interpret decimal):

1:

"Synchronous safe position via PROFIsafe" is enabled (p9501.29 = 1) and is not set according to the rule  $Tdp = 2 \times n \times p9500$  ( $n = 1, 2, 3, \dots$ ).

2:

"Synchronous safe position via PROFIsafe" is enabled (p9501.29 = 1) and isochronous operation is not set.

**Note:**

STO: Safe Torque Off

**Remedy:**

For fault value = 1:

- set bus cycle time Tdp and monitoring clock cycle p9500 according to the rule  $Tdp = 2 \times n \times p9500$  ( $n = 1, 2, 3, \dots$ ).

For fault value = 2:

- set "Isochronous mode" on the PROFIBUS/PROFINET controller.

---

### 201679 <location>SI CU: Safety parameter settings and topology changed, warm restart/POWER ON required

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2 (OFF1, OFF3)

**Acknowledge:** POWER ON

**Cause:** Safety parameters have been changed; these will only take effect following a warm restart or POWER ON (see alarm A01693).

A partial power up (boot) with modified configuration was then performed.

**Remedy:**

- carry out a warm restart (p0009 = 30, p0976 = 2, 3).
- carry out a POWER ON (switch-off/switch-on) for all components.

---

### 201680 <location>SI Motion P1 (CU): Checksum error safety monitoring functions

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The actual checksum calculated by the drive and entered in r9728 via the safety-relevant parameters does not match the reference checksum saved in p9729 at the last machine acceptance.  
Safety-relevant parameters have been changed or a fault is present.

**Note:**

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

0: Checksum error for SI parameters for motion monitoring.

1: Checksum error for SI parameters for actual values.

2: Checksum error for SI parameters for component assignment.

**Remedy:**

- check the safety-relevant parameters and if required, correct.
- execute the function "Copy RAM to ROM".
- perform a POWER ON if safety parameters requiring a POWER ON have been modified.
- carry out an acceptance test.

---

**201681**      **<location>SI Motion P1 (CU): Incorrect parameter value**

**Drive object:** HLA\_828

**Message value:** Parameter: %1, supplementary information: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The parameter cannot be parameterized with this value.

**Note:**  
 This message does not result in a safety stop response.  
 Fault value (r0949, interpret decimal):

 SLA (p9501.20 = 1) is enabled with a 2-encoder system (p9526 not equal to 1).  
 xxxx = 9511 and yyyy = 1:  
 Parameter p9511 is not equal to p9311.  
 xxxx = 9511 and yyyy = 2:  
 Between the drive objects no different values in p9511 and p0115[0] are permitted.  
 xxxx = 9522:  
 The gear stage was set too high.  
 xxxx = 9534 or 9535:  
 The limit values of SLP have been set too high (absolute values).  
 xxxx = 9544:  
 For linear axes, the maximum value is limited to 1 mm.  
 xxxx = 9547:  
 Parameter p9547 has been set too low.  
 xxxx = 9573:  
 "Referencing via Safety Control Channel" was requested (p9573 = 263), without enabling the function "Referencing via SCC" (p9501.27 = 0).  
 xxxx = 9578:

SLA is enabled (p9501.20 = 1). Acceleration limit is too low (p9578). The acceleration resolution is no longer sufficient (r9790).

The minimum limit is x-times the acceleration resolution:

- firmware version 5.1:  $3 * r9790[0]$

- firmware version 5.2 and higher:  $10 * r9790[1]$

xxxx = 9601 and yyyy = 1:

If motion monitoring functions integrated in the drive (p9601.2 = 1) and extended functions without selection (p9601.5 = 1) are activated, then PROFIsafe (p9601.3 = 1) is not possible.

xxxx = 9601 and yyyy = 2:

Extended functions without selection (p9601.5 = 1) are enabled without enabling motion monitoring functions integrated in the drive (p9601.2).

xxxx = 9601 and yyyy = 5:

Transfer of the SLS limit value via PROFIsafe (p9501.24) has been enabled, without enabling PROFIsafe.

xxxx = 9601 and yyyy = 6:

Transfer of the safe position via PROFIsafe (p9501.25) has been enabled, without enabling PROFIsafe.

xxxx = 9601 and yyyy = 7:

Safe switchover of the gearbox stages (p9501.26) has been enabled without enabling PROFIsafe.

xxxx = 9601 and yyyy = 18:

SLA (p9501.20 = 1) is enabled without enabling PROFIsafe.

xxxx = 9601 and yyyy = 21:

SS2ESR (p9501.4 = 1) is enabled without enabling PROFIsafe.

**Remedy:** Correct parameter (if required, also on another monitoring channel, p9801).

If xxxx = 9500 and yyyy = 1:  
 - set p9500 "SI Motion monitoring clock cycle" as an integer multiple of p0115[0] "Current controller sampling time".  
 - align parameters 9300 and 9500, backup parameters (p0971 = 1) and carry out a POWER ON.

For xxxx = 9500 and yyyy = 16:  
 Inhibit "Synchronous safe position via PROFIsafe" function (p9501.29 = 0), or set monitoring clock cycle p9500 on all axes the same when the function is enabled.

If xxxx = 9501:  
 - correct parameters p9501.16 and p9301.16, or deselect the extended functions without selection (p9601.5).  
 If xxxx = 9501 and yyyy = 8:  
 Inhibit referencing via SCC (p9501.27) or enable an absolute motion monitoring function (p9501.1 or p9501.2).  
 If xxxx = 9501 and yyyy = 10:  
 Inhibit referencing via SCC (p9501.27) or EPOS (r0108.4).  
 For xxxx = 9501 and yyyy = 11:  
 Inhibit SS2E (p9501.18) - or enable PROFIsafe.  
 For xxxx = 9501 and yyyy = 12:  
 Inhibit SCA (p9501.28) - or enable PROFIsafe.  
 For xxxx = 9501 and yyyy = 14:  
 Inhibit "Synchronous safe position via PROFIsafe" function (p9501.29 = 0), or enable "Safe position via PROFIsafe" (p9501.25).  
 For xxxx = 9501 and yyyy = 17:  
 Inhibit "Synchronous safe position via PROFIsafe" function (p9501.29 = 0), or set "Safety with encoder" (p9506).  
 For xxxx = 9501 and yyyy = 19:  
 Inhibit SLA (p9501.20) or activate actual value sensing with encoder (p9506 equal to 0 or 2).  
 For xxxx = 9501 and yyyy = 20:  
 Inhibit SLA (p9501.20) or activate a 1-encoder system (p9526 equal to 5).  
 For xxxx = 9511:  
 Align parameters p9311 and p9511, back up the parameters (p0971 = 1) and carry out a POWER ON.  
 For xxxx = 9517:  
 Parameter p9516.0 should also be checked.  
 For xxxx = 9522:  
 Correct the corresponding parameter.  
 For xxxx = 9534 or 9535:  
 Reduce the limit values (absolute values) of SLP.  
 For xxxx = 9544:  
 Correct parameter (for linear axes, the maximum value is limited to 1 mm).  
 For xxxx = 9547:  
 With hysteresis/filtering enabled (p9501.16 = 1), the following applies:  
 - set parameters p9546/p9346 and p9547/p9347 according to the following rule:  $p9546 \geq 2 \times p9547$ ;  $p9346 \geq 2 \times p9347$   
 - if the actual value synchronization is enabled (p9501.3 = 1), then this rule must be complied with:  $p9549 \leq p9547$ ;  $p9349 \leq p9347$   
 For xxxx = 9578:  
 - observe the information in r9790.  
 If xxxx = 9601:  
 yyyy = 1:  
 Only enable motion monitoring functions integrated in the drive (p9601.2 = 1) and extended functions without selection (p9601.5 = 1) – or only PROFIsafe (p9601.3 = 1).  
 yyyy = 2:  
 Enable motion monitoring functions integrated in the drive (p9601.2 = 1).  
 yyyy = 5:  
 To transfer the SLS limit values via PROFIsafe (p9501.24 = 1), also enable PROFIsafe (p9601.3 = 1) and motion monitoring functions integrated in the drive (p9601.2 = 1).  
 yyyy = 6:

For the safe position via PROFIsafe (p9501.25 = 1), also enable PROFIsafe (p9601.3 = 1) and the motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 7:

For safe switchover of gearbox stages (p9501.26 = 1) also enable PROFIsafe (p9601.3 = 1) and the motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 18:

For Safely-Limited Acceleration (p9501.20 = 1), also enable PROFIsafe (p9601.3 = 1) and the motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 21:

For Safe Stop 2 Extended Stop and Retract (p9501.4), also enable PROFIsafe (p9601.3 = 1) and motion monitoring functions integrated in the drive (p9601.2 = 1).

- firmware version 5.2 and higher:  $10 * r9790[1]$

xxxx = 9585:

For Safety without encoder and synchronous motor, p9585 must be set to 4.

xxxx = 9601 and yyyy = 1:

If motion monitoring functions integrated in the drive (p9601.2 = 1) and extended functions without selection (p9601.5 = 1) are enabled, then PROFIsafe (p9601.3 = 1) or onboard F-DI (p9601.4 = 1) is not possible.

xxxx = 9601 and yyyy = 2:

Extended functions without selection (p9601.5 = 1) are enabled without enabling motion monitoring functions integrated in the drive (p9601.2).

xxxx = 9601 and yyyy = 3:

Onboard F-DI are enabled without enabling motion monitoring functions integrated in the drive (p9601.2).

xxxx = 9601 and yyyy = 4:

Onboard F-DI are enabled. Then, it is not permissible to simultaneously set PROFIsafe and F-DI via PROFIsafe (p9501.30).

xxxx = 9601 and yyyy = 5:

Transfer of the SLS limit value via PROFIsafe (p9501.24) has been enabled, without enabling PROFIsafe.

xxxx = 9601 and yyyy = 6:

Transfer of the safe position via PROFIsafe (p9501.25) has been enabled, without enabling PROFIsafe.

xxxx = 9601 and yyyy = 7:

Safe switchover of the gearbox stages (p9501.26) has been enabled without enabling PROFIsafe.

xxxx = 9601 and yyyy = 11:

SS2E (p9501.18 = 1) is enabled without PROFIsafe being enabled.

xxxx = 9601 and yyyy = 12:

SCA (p9501.28 = 1) is enabled without enabling PROFIsafe.

xxxx = 9601 and yyyy = 18:

SLA (p9501.20 = 1) is enabled without enabling PROFIsafe.

xxxx = 9601 and yyyy = 21:

SS2ESR (p9501.4 = 1) is enabled without enabling PROFIsafe.

**Remedy:** Correct parameter (if required, also on another monitoring channel, p9801).

If xxxx = 9500 and yyyy = 1:

- set p9500 "SI Motion monitoring clock cycle" as an integer multiple of p0115[0] "Current controller sampling time".
- align parameters 9300 and 9500, backup parameters (p0971 = 1) and carry out a POWER ON.

For xxxx = 9500 and yyyy = 16:

Inhibit "Synchronous safe position via PROFIsafe" function (p9501.29 = 0), or set monitoring clock cycle p9500 on all axes the same when the function is enabled.

If xxxx = 9501:

- correct parameters p9501.16 and p9301.16, or deselect the extended functions without selection (p9601.5).

If xxxx = 9501 and yyyy = 8:

Inhibit referencing via SCC (p9501.27) or enable an absolute motion monitoring function (p9501.1 or p9501.2).

If xxxx = 9501 and yyyy = 10:

Inhibit referencing via SCC (p9501.27) or EPOS (r0108.4).

For xxxx = 9501 and yyyy = 11:

Inhibit SS2E (p9501.18) - or enable PROFIsafe.

For xxxx = 9501 and yyyy = 12:

Inhibit SCA (p9501.28) - or enable PROFIsafe.

For xxxx = 9501 and yyyy = 14:

Inhibit "Synchronous safe position via PROFIsafe" function (p9501.29 = 0), or enable "Safe position via PROFIsafe" (p9501.25).

For xxxx = 9501 and yyyy = 17:

Inhibit "Synchronous safe position via PROFIsafe" function (p9501.29 = 0), or set "Safety with encoder" (p9506).

For xxxx = 9501 and yyyy = 19:

Inhibit SLA (p9501.20) or activate actual value sensing with encoder (p9506 equal to 0 or 2).

For xxxx = 9501 and yyyy = 20:

Inhibit SLA (p9501.20) or activate a 1-encoder system (p9526 equal to 1).

For xxxx = 9505:

Correct parameter p9501.1 or p9505.

For xxxx = 9507:

Set synchronous or induction motor according to p0300.

For xxxx = 9506:

Align parameters p9306 and p9506, back up the parameters (p0971 = 1) and carry out a POWER ON.

For xxxx = 9511:

Align parameters p9311 and p9511, back up the parameters (p0971 = 1) and carry out a POWER ON.

For xxxx = 9517:

Parameter p9516.0 should also be checked.

For xxxx = 9319:

For the SCSE encoder, parameter p9319 must not be set higher than 11.

For xxxx = 9522:

Correct the corresponding parameter.

For xxxx = 9534 or 9535:

Reduce the limit values (absolute values) of SLP.

For xxxx = 9544:

Correct parameter (for linear axes, the maximum value is limited to 1 mm).

For xxxx = 9547:

With hysteresis/filtering enabled (p9501.16 = 1), the following applies:

- set parameters p9546 and p9547 according to the following rule:  $p9547 \leq 0.75 \times p9546$
- if the actual value synchronization is enabled (p9501.3 = 1), then this rule must be complied with:  $p9547 \geq p9549$

For xxxx = 9576:

- update the firmware on the Motor Module.
- deselect function with value 0.

For xxxx = 9578:

- observe the information in r9790.

For xxxx = 9585:

Correct parameter (if required, also on the second monitoring channel, p9385).

If xxxx = 9601:

yyyy = 1:

Only enable motion monitoring functions integrated in the drive (p9601.2 = 1) and extended functions without selection (p9601.5 = 1), or only enable PROFIsafe (p9601.3 = 1) or only onboard F-DI (p9601.4 = 1).

yyyy = 2, 3:

Enable motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 4:

If onboard F-DI are enabled, then it is not permissible to simultaneously set PROFIsafe and F-DI via PROFIsafe (p9501.30), deselect PROFIsafe functionality or onboard F-DI.

yyyy = 5:

To transfer the SLS limit values via PROFIsafe (p9501.24 = 1), also enable PROFIsafe (p9601.3 = 1) and motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 6:

For the safe position via PROFIsafe (p9501.25 = 1), also enable PROFIsafe (p9601.3 = 1) and the motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 7:

For safe switchover of gearbox stages (p9501.26 = 1) also enable PROFIsafe (p9601.3 = 1) and the motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 18:

For Safely-Limited Acceleration (p9501.20 = 1), also enable PROFIsafe (p9601.3 = 1) and the motion monitoring functions integrated in the drive (p9601.2 = 1).

yyyy = 21:

For Safe Stop 2 Extended Stop and Retract (p9501.4), also enable PROFIsafe (p9601.3 = 1) and motion monitoring functions integrated in the drive (p9601.2 = 1).

Note:

SCA: Safe Cam

SCSE: Single Channel Safety Encoder (single-channel encoder)

SS2E: Safe Stop 2 External (Safe Stop 2 with external stop, external STOP D)

SS2ESR: Safe Stop 2 Extended Stop and Retract

SLA: Safely-Limited Acceleration

**Cause:** The monitoring function enabled in p9501, p9601, p9801, p9307 or p9507 is not supported in this firmware version.

Note:

This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

- 1: Monitoring function SLP not supported (p9501.1).
- 2: Monitoring function SCA not supported (p9501.7 and p9501.8 ... 15 and p9503).
- 3: Monitoring function SLS override not supported (p9501.5).
- 4: Monitoring function external ESR activation not supported (p9501.4).
- 5: Monitoring function F-DI in PROFIsafe not supported (p9501.30).
- 6: Enable actual value synchronization not supported (p9501.3).
- 9: Monitoring function not supported by the firmware or enable bit not used.
- 10: Monitoring functions only supported for a SERVO drive object.
- 11: Encoderless monitoring functions (p9506.1) only supported for motion monitoring integrated in the drive (p9601.2).
- 12: Monitoring functions for ncSI are not supported for CU305.
- 14: Monitoring function SLA and ncSI not supported.
- 20: Motion monitoring functions integrated in the drive are only supported in conjunction with PROFIsafe (p9501, p9601.1 ... 2 and p9801.1 ... 2).
- 21: Enable a safe motion monitoring function (in p9501), not supported for enabled basic functions via PROFIsafe (p9601.2 = 0, p9601.3 = 1).
- 22: Encoderless monitoring functions in "chassis" format not supported.
- 23: CU240 does not support monitoring functions requiring an encoder.
- 24: Monitoring function SDI not supported (p9501.17).
- 25: Drive-integrated motion monitoring functions not supported (p9501, p9601.2).
- 26: Hysteresis and filtering for SSM monitoring function without an encoder not supported (p9501.16).
- 27: This hardware does not support onboard F-DI and F-DO.
- 28: Encoderless monitoring functions are not supported for synchronous motors (p9507.2).
- 29: SINAMICS S120M: Safety Extended Functions without encoder not supported.
- 31: This hardware does not support transfer SLS (SG) limit value via PROFIsafe (p9301/p9501.24).
- 33: Safety functions without selection not supported (p9601.5, p9801.5).
- 34: This module does not support safe position via PROFIsafe.
- 36: Function "SS1E" not supported.
- 37: Safe actual value sensing with HTL/TTL encoder (SMC30) not supported.
- 38: It is not permissible to simultaneously enable the safety functions (p9601) and the essential service mode (ESM, Essential Service Mode, p3880).
- 39: This module or software version of the CU/MM does not support safe gearbox stage switchover (p9501.26).
- 40: SIMOTION D410-2: Motion monitoring functions integrated in the drive or PROFIsafe control not supported.
- 41: SIMOTION D410-2: Safety functions not supported for the "Chassis" format.
- 42: Motion monitoring functions SLP and SP not supported for D4x5-2 and CX32-2 (p9501.1/25).
- 43: Motion monitoring functions SLP and SP as well as PROFIsafe telegrams 31/901/902 not supported for D410-2 (p9501.1/24/25/30, p9611).
- 44: This module/this software version does not support referencing via the Safety Control Channel (p9501.27).
- 45: Deactivating SOS/SLS during an external STOP A is not supported (p9501.23).
- 46: This firmware version does not support control of the basis functions via TM54F and the simultaneous enable of the extended functions or ncSI or PROFIsafe.
- 50: Shortening the switchover times for SOS (p9569/p9369, p9567/p9367) is not supported.
- 51: Safe actual value sensing with SCSE is not supported for dbSi (motion monitoring functions integrated in the drive, p9601.2 = 1).
- 52: "SBR with encoder" function is not supported (p9506 = 2).
- 53: SS2E function not supported (p9501.18).
- 54: SCA function not supported (p9501.28).
- 57: "Synchronous transfer safe position via PROFIsafe" function not supported (p9501.29).
- 58: "Safety limited acceleration" function (SLA) not supported (p9501.20).
- 59: Safe actual value sensing with SIL3 encoder not supported.

9586: The set value of p9586/p9386 is greater than the supported maximum value.  
 9588: The set value of p9588/p9388 is greater than the supported maximum value.  
 9589: The set value of p9589/p9389 is greater than the supported maximum value.  
 9612: An attempt was made to parameterize STOP B as stop response for PROFI-safe failure, although PROFI-safe is not enabled.

See also: p9612 (SI PROFI-safe failure response (Control Unit))

**Remedy:**

- deselect the monitoring function involved (p9501, p9503, p9506, p9601, p9801, p9307, p9507).
- reduce the set value (p9586, p9588, p9589).
- increase the set value (p9578).

For fault value = 59:

- upgrade the firmware of the Motor Module to a later version.

For fault value = 9612:

- establish communications with PROFI-safe (p9601).
- parameterize STOP A as the stop response for PROFI-safe failure (p9612 = 0).

Note:

ESR: Extended Stop and Retract

SBR: Safe Brake Ramp (safe brake ramp monitoring)

SCA: Safe Cam / SN: Safe software cam

SCSE: Single Channel Safety Encoder (single-channel encoder)

SDI: Safe Direction (safe motion direction)

SLA: Safely-Limited Acceleration

SI: Safety Integrated

SLP: Safely-Limited Position / SE: Safe software limit switches

SLS: Safely-Limited Speed / SG: Safely reduced speed

SOS: Safe Operating Stop / SBH: Safe operating stop

SP: Safe Position

SPL: Safe programmable logic

SS1E: Safe Stop 1 External (Safe Stop 1 with external stop)

SS2E: Safe Stop 2 External (Safe Stop 2 with external stop, external STOP D)

**201683      <location>SI Motion P1 (CU): SOS/SLS enable missing**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The safety-relevant basic function "SOS/SLS" is not enabled in p9501 although other safety-relevant monitoring functions are enabled.

Note:

This fault does not result in a safety stop response.

**Remedy:** Enable the function "SOS/SLS" (p9501.0) and carry out a POWER ON.

Note:

SI: Safety Integrated

SLS: Safely-Limited Speed / SG: Safely reduced speed

SOS: Safe Operating Stop / SBH: Safe operating stop

See also: p9501 (SI Motion enable safety functions (Control Unit))

---

**201684      <location>SI Motion P1 (CU): Safely-Limited Position limit values interchanged**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** For the function "Safely-Limited Position" (SLP), a lower value is in p9534 than in p9535.

**Note:**

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

1: Limit values SLP1 interchanged.

2: Limit values SLP2 interchanged.

See also: p9534, p9535

**Remedy:** - correct the lower and upper limit values (p9535, p9534).

- carry out a POWER ON (switch-off/switch-on).

**Note:**

SI: Safety Integrated

SLP: Safely-Limited Position / SE: Safe software limit switches

---

### 201685 <location>SI Motion P1 (CU): Safely-Limited Speed limit value too high

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The limit value for the function "Safely-Limited Speed" (SLS) is greater than the speed that corresponds to an encoder limit frequency of 500 kHz.

**Note:**

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

Maximum permissible speed.

**Remedy:** Correct the limit values for SLS and carry out a POWER ON.

**Note:**

SI: Safety Integrated

SLS: Safely-Limited Speed / SG: Safely reduced speed

See also: p9531

**Cause:** There is not sufficient memory space in the NVRAM on the drive to save parameters r9781 and r9782 (safety logbook).  
**Note:**  
 This fault does not result in a safety stop response.  
 Fault value (r0949, interpret decimal):  
 0: There is no physical NVRAM available in the drive.  
 1: There is no longer any free memory space in the NVRAM.

**Remedy:** For fault value = 0:  
 - use a Control Unit NVRAM.  
 For fault value = 1:  
 - deselect functions that are not required and that take up memory space in the NVRAM.  
 - contact Technical Support.  
**Note:**  
 NVRAM: Non-Volatile Random Access Memory (non-volatile read and write memory)

### 201691 <location>SI Motion: Ti and To unsuitable for DP cycle

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The configured times for PROFIBUS communication are not permitted and the DP cycle is used as the actual value acquisition cycle for the safe movement monitoring functions.

Isochronous PROFIBUS:

The sum of Ti and To is too high for the selected DP cycle. The DP cycle should be at least 1 current controller cycle greater than the sum of Ti and To.

No isochronous PROFIBUS:

The DP clock cycle must be at least 4x the current controller clock cycle.

**Notice:**

If this alarm is not observed, then message C01711 or C30711 – with the value 1020 ... 1021 – can sporadically occur.

**Remedy:** Configure Ti and To low so that they are suitable for the DP cycle or increase the DP cycle time.

Alternative when SI monitoring integrated in the drive is enabled (p9601/p9801 > 0):

Use the actual value acquisition cycle p9511/p9311 and, in turn, set independently from DP cycle. The actual values sensing clock cycle must be at least 4x the current controller clock cycle. A clock cycle ratio of at least 8:1 is recommended.

See also: p9511 (SI Motion actual value sensing cycle clock (Control Unit))

---

### 201692 <location>SI Motion P1 (CU): Parameter value not permitted for encoderless

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Parameter: %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The parameter cannot be set to this value if encoderless motion monitoring functions have been selected in p9506.

**Note:**

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

Parameter number with the incorrect value.

See also: p9501 (SI Motion enable safety functions (Control Unit))

**Remedy:** - correct the parameter specified in the fault value.

- if necessary, deselect encoderless motion monitoring functions (p9506).

See also: p9501 (SI Motion enable safety functions (Control Unit))

---

### 201693 <location>SI P1 (CU): Safety parameter setting changed, warm restart/POWER ON required

| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                       |
| <b>Cause:</b>         | Safety parameters have been changed; these will only take effect following a warm restart or POWER ON.<br>Alarm value (r2124, interpret decimal):<br>Parameter number of the safety parameter which has changed, necessitating a warm restart or POWER ON. |
| <b>Remedy:</b>        | - carry out a warm restart (p0009 = 30, p0976 = 2, 3).<br>- carry out a POWER ON (switch-off/switch-on) for all components.<br>Note:<br>Before performing an acceptance test, a POWER ON must be carried out for all components.                           |

| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Cause:</b>         | A Sensor Module, which is used for safe motion monitoring functions, was replaced. The hardware replacement must be acknowledged. An acceptance test must be subsequently performed.<br>Note:<br>This message does not result in a safety stop response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Remedy:</b>        | Carry out the following steps using the STARTER commissioning tool:<br>- press the "Acknowledge hardware replacement" button in the safety screen form.<br>- execute the function "Copy RAM to ROM".<br>- carry out a POWER ON (switch-off/switch-on) for all components.<br>As an alternative, carry out the following steps in the expert list of the commissioning tool:<br>- start the copy function for the node identifier on the drive (p9700 = 1D hex).<br>- acknowledge the hardware CRC on the drive (p9701 = EC hex).<br>- save all parameters (p0977 = 1).<br>- carry out a POWER ON (switch-off/switch-on) for all components.<br>Then carry out an acceptance test (refer to the Safety Integrated Function Manual).<br>For SINUMERIK, the following applies:<br>HMI supports the replacement of components with Safety functions (operating area "Diagnostics" --> Softkey "Alarm list" --> Softkey "Confirm SI HW" etc.).<br>The precise procedure is given in the following document:<br>SINUMERIK Function Manual Safety Integrated<br>See also:p9700 (SI Motion copy function), p9701 (Acknowledge SI motion data change) |

**Cause:** The commissioning of the "Safety Integrated" function is selected.  
This message is withdrawn after the safety functions have been commissioned.

**Note:**

- this message does not result in a safety stop response.
- in the safety commissioning mode, the "STO" function is internally selected.

See also:p0010

**Remedy:** Not necessary.

**Note:**

CU: Control Unit

SI: Safety Integrated

---

**201699 <location>SI P1 (CU): Test stop for STO required**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The time set in p9659 for the forced checking procedure (test stop) for the "STO" function has been exceeded. A new forced checking procedure is required.

After the next time the "STO" function is deselected, the message is withdrawn and the monitoring time is reset.

**Note:**

- this message does not result in a safety stop response.
- the test must be performed within a defined, maximum time interval (p9659) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

See also:p9659 (SI forced checking procedure timer), r9660 (SI forced checking procedure remaining time)

**Remedy:** Select STO and then deselect again.

**Note:**

CU: Control Unit

SI: Safety Integrated

STO: Safe Torque Off / SH: Safe standstill

---

**201700 <location>SI Motion P1 (CU): STOP A initiated**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive is stopped via a STOP A (STO via the safety switch-off signal path of the Control Unit).

Possible causes:

- stop request from the second monitoring channel.
- STO not active after parameterized time (p9557) after test stop selection.
- subsequent response to the message C01706 "SI Motion CU: SAM/SBR limit exceeded".
- subsequent response to the message C01714 "SI Motion CU: Safely-Limited Speed exceeded".
- subsequent response to the message C01701 "SI Motion CU: STOP B initiated".
- subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".
- subsequent response to the message C01716 "SI Motion CU: tolerance for safe motion direction exceeded".

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Message value:</b> | -                                                                                                                                                                                       |
| <b>Reaction:</b>      | NONE                                                                                                                                                                                    |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                  |
| <b>Cause:</b>         | The actual position has distanced itself further from the target position than the standstill tolerance.<br>The drive is shut down by the message C01701 "SI Motion: STOP B initiated". |

**Remedy:**

- check whether safety faults are present and if required carry out the appropriate diagnostic routines for the particular faults.
- check whether the standstill tolerance matches the accuracy and control dynamic performance of the axis.
- carry out a POWER ON.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

### 201708 <location>SI Motion P1 (CU): STOP C initiated

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** STOP2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive is stopped via a STOP C (braking along the OFF3 deceleration ramp).  
"Safe Operating Stop" (SOS) is activated after the parameterized time has expired.  
Possible causes:

- stop request from the higher-level control.
  - subsequent response to the message C01714 "SI Motion CU: Safely-Limited Speed exceeded".
  - subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".
  - subsequent response to the message C01716 "SI Motion CU: tolerance for safe motion direction exceeded".
- See also:p9552 (SI Motion transition time STOP C to SOS (SBH) (Control Unit))

**Remedy:**

- remove the cause of the fault at the control.
- carry out a diagnostics routine for message C01714/C01715/C01716.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

### 201709 <location>SI Motion P1 (CU): STOP D initiated

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive is stopped via a STOP D (braking along the path).  
"Safe Operating Stop" (SOS) is activated after the parameterized time has expired.  
Possible causes:

- stop request from the higher-level control.
- subsequent response to the message C01714 "SI Motion CU: Safely-Limited Speed exceeded".
- subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".
- subsequent response to the message C01716 "SI Motion CU: tolerance for safe motion direction exceeded".

See also:p9553 (SI Motion transition time STOP D to SOS (SBH) (Control Unit))

**Remedy:**

- remove the cause of the fault at the control.
- carry out a diagnostics routine for message C01714/C01715/C01716.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

SOS: Safe Operating Stop / SBH: Safe operating stop

---

**201710 <location>SI Motion P1 (CU): STOP E initiated**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The drive is stopped via a STOP E (retraction motion).  
"Safe Operating Stop" (SOS) is activated after the parameterized time has expired.  
Possible causes:

- stop request from the higher-level control.
- subsequent response to the message C01714 "SI Motion CU: Safely-Limited Speed exceeded".
- subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".
- subsequent response to the message C01716 "SI Motion CU: tolerance for safe motion direction exceeded".

See also: p9554 (SI Motion transition time STOP E to SOS (SBH) (Control Unit))

**Remedy:**

- remove the cause of the fault at the control.
- carry out a diagnostics routine for message C01714/C01715/C01716.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).
- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

SOS: Safe Operating Stop / SBH: Safe operating stop

---

**201711 <location>SI Motion P1 (CU): Defect in a monitoring channel**

**Drive object:** HLA\_828

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

- Cause:**
- When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.
- If at least one monitoring function is active, then after the parameterized timer has expired, the message C01701 "SI Motion: STOP B initiated" is output.
- The message value that resulted in a STOP F is displayed in r9725.
- If the drive is operated together with a SINUMERIK, the message values are described in message 27001 of SINUMERIK, with the exception of the following message values, which can only occur in SINAMICS:
- 1007: communication error with the PLC (sign-of-life)
  - 1008: communication error with the PLC (CRC)
- The following described message values involve the data cross-check between the two monitoring channels (safety functions integrated in the drive).
- The message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:
- cycle times not uniformly parameterized (p9500/p9300 and p9511/p9311)
  - excessively fast cycle times (p9500/p9300, p9511/p9311).
  - For message values 3, 44 ... 57, 232 and 1-encoder system, differently set encoder parameters.
  - For message values 3, 44 ... 57, 232 and 2-encoder system, encoder parameters that have not been correctly set.
  - incorrect synchronization.
- Message value (r9749, interpret decimal):
- 0 to 999: Number of the cross-compared data that resulted in this fault.
- Message values that are not subsequently listed are only for internal Siemens troubleshooting.
- 0: Stop request from another monitoring channel.
  - 1: Status image of monitoring functions SOS, SLS, SAM/SBR, SDI or SLP (result list 1) (r9710[0], r9710[1]).
  - 2: Status image of monitoring function SCA or n < nx (result list 2) (r9711[0], r9711[1]).
  - 3: The position actual value differential (r9713[0/1]) between the two monitoring channels is greater than the tolerance in p9542/p9342. When actual value synchronization is enabled (p9501.3/p9301.3), the velocity differential (based on the position actual value) is greater than the tolerance in p9549/p9349.
  - 4: Error when synchronizing the data cross-check between the two channels.
  - 5: Enable safe functions (p9501/p9301). Safety monitoring clock cycle too small (p9500/p9300).
  - 6: Limit value for SLS1 (p9531[0]/p9331[0])
  - 7: Limit value for SLS2 (p9531[1]/p9331[1])
  - 8: Limit value for SLS3 (p9531[2]/p9331[2])
  - 9: Limit value for SLS4 (p9531[3]/p9331[3])
  - 10: Standstill tol. (p9530/p9330)
  - 11: Upper limit value for SLP1 (p9534[0]/p9334[0]).
  - 12: Lower limit value for SLP1 (p9535[0]/p9335[0]).
  - 13: Upper limit value for SLP2 (p9534[1]/p9334[1]).
  - 14: Lower limit value for SLP2 (p9535[1]/p9335[1]).
  - 31: Position tolerance (p9542/p9342) or (p9549/p9349) when actual value synchronization is enabled (p9501.3/p9301.3)
  - 32: Position tolerance for safe referencing (p9544/p9344).
  - 33: Time, velocity changeover (p9551/p9351)
  - 35: Delay time, STOP A (p9556/p9356)
  - 36: Checking time, STO (p9557/p9357)
  - 37: Trans. time, STOP C to SOS (p9552/p9352)
  - 38: Trans. time STOP D to SOS (p9553/p9353)
  - 39: Trans. time, STOP E to SOS (p9554/p9354)
  - 40: Stop response for SLS (p9561/p9361).
  - 41: Stop response for SLP1 (p9562[0]/p9362[0]).
  - 42: Shutdown speed, STO (p9560/p9360)
  - 43: Memory test stop response (STOP A).
  - 44 ... 57: General
- Possible cause 1 (during commissioning or parameter modification)
- The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

Permissible deviation between the two monitoring channels: p9542/p9342.

44: Position actual value (r9713[0/1]) + limit value SLS1 (p9531[0]/p9331[0]) \* safety monitoring clock cycle (p9500/p9300).

45: Position actual value (r9713[0/1]) - limit value SLS1 (p9531[0]/p9331[0]) \* safety monitoring clock cycle (p9500/p9300).

46: Position actual value (r9713[0/1]) + limit value SLS2 (p9531[1]/p9331[1]) \* safety monitoring clock cycle (p9500/p9300).

47: Position actual value (r9713[0/1]) - limit value SLS2 (p9531[1]/p9331[1]) \* safety monitoring clock cycle (p9500/p9300).

48: Position actual value (r9713[0/1]) + limit value SLS3 (p9531[2]/p9331[2]) \* safety monitoring clock cycle (p9500/p9300).

49: Position actual value (r9713[0/1]) - limit value SLS3 (p9531[2]/p9331[2]) \* safety monitoring clock cycle (p9500/p9300).

50: Position actual value (r9713[0/1]) + limit value SLS4 (p9531[3]/p9331[3]) \* safety monitoring clock cycle (p9500/p9300).

51: Position actual value (r9713[0/1]) - limit value SLS4 (p9531[3]/p9331[3]) \* safety monitoring clock cycle (p9500/p9300).

52: Standstill position + tolerance (p9530/p9330)

53: Standstill position - tolerance (p9530/p9330)

54: Position actual value (r9713[0/1]) + limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300) + tolerance (p9542/p9342).

55: Position actual value (r9713[0/1]) + limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300).

56: Position actual value (r9713[0/1]) - limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300).

57: Position actual value (r9713[0/1]) - limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300) - tolerance (p9542/p9342).

58: Actual stop request.

75: Velocity limit nx (p9546, p9346).

When the function "n < nx: hysteresis and filtering" (p9501.16 = 1) is enabled, this message value is also output for a different hysteresis tolerance (p9547/p9347).

76: Stop response for SLS1 (p9563[0]/p9363[0]).

77: Stop response for SLS2 (p9563[1]/p9363[1]).

78: Stop response for SLS3 (p9563[2]/p9363[2]).

79: Stop response for SLS4 (p9563[3]/p9363[3]).

81: Velocity tolerance for SAM (p9548/p9348)

82: SGEs for SLS correction factor.

83: Acceptance test timer (p9558/p9358)

84: Trans. time STOP F (p9555/p9355)

85: Trans. time bus failure (p9580/p9380)

86: ID 1-encoder system (p9526/p9326).

87: Encoder assignment, second channel (p9526/p9326)

89: Encoder limit freq.

230: Filter time constant for n < nx.

231: Hysteresis tolerance for n < nx.

232: Smoothed velocity actual value.

233: Limit value nx / safety monitoring clock cycle + hysteresis tolerance.

234: Limit value nx / Safety monitoring clock cycle.

235: -Limit value nx / Safety monitoring clock cycle.

236: -Limit value nx / safety monitoring clock cycle - hysteresis tolerance.

237: SGA n < nx.

238: Speed limit value for SAM (p9568/p9368).

243: Function configuration (p9507/p9307).

- 246: Voltage tolerance acceleration (p9589/p9389).
- 247: SDI tolerance (p9564/p9364).
- 248: SDI positive upper limit (7FFFFFFF hex).
- 249: Position actual value (r9713[0/1]) - SDI tolerance (p9564/p9364).
- 250: Position actual value (r9713[0/1]) + SDI tolerance (p9564/p9364).
- 251: SDI negative lower limit (80000001 hex).
- 252: SDI stop response (p9566/p9366).
- 253: SDI delay time (p9565/p9365).
- 256: Status image of monitoring functions SOS, SLS, SLP, test stop, SBR, SDI (result list 1 ext) (r9710).
- 257: Safety functions for motion monitoring functions without selection (p9512/p9312) different.
- 259: Scaling factor for safe position via PROFIsafe (p9574/p9374) or PROFIsafe telegram (p9611/p9811) different.
- 260: Modulo value including scaling (p9505/p9305 and p9574/p9374) for SP with 16 bit.
- 263: Stop response for SLP2 (p9562[1]/p9362[1])
- 264: Position tolerance including scaling (p9542/p9342 and p9574/p9374) for SP with 16 bit.
- 265: Status image of all change functions (results list 1) (r9710).
- 266: The switchover speed to SOS differs (p9567/p9367).
- 267: The transition time to SOS after standstill differs (p9569/p9369).
- 268: SLP delay time differs (p9577/p9377).
- 269: Factor to increase the position tolerance when switching over the gearbox stage (p9543/p9343).
- 270: Screen form for SGE image: all functions, which are not supported/enabled for the actual parameterization (p9501/p9301, p9601/p9801 and p9506/p9306)..
- 271: Screen form for SGE image: Deselect all bits for the "Safe gearbox switchover" function.
- 272: Activation of the increased position tolerance for the "Safe gearbox switchover" function different.
- 273: speed limit value for flattening the ramp for SAM/SBR different.
- 274: SGA SCA, cams 1 to 15.
- 275: SGA SCA, cams 16 to 30.
- 276: Limit value for SLA1 (p9578/p9378).
- 277: Stop response for SLA1 (p9579/p9379).
- 278: Upper limit value for SLA1.
- 279: Lower limit value for SLA1.
- 280: Upper limit value for SLA1 (fine resolution).
- 281: Lower limit value for SLA1 (fine resolution).
- 282: SLA filter time.
- 283: Acceleration actual value (fine resolution).
- 1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.
- 1001: Initialization error of watchdog timer.
- 1002:  
User agreement after the timer has expired different.  
The user agreement is not consistent. After a time of 4 s has expired, the status of the user agreement is different in both monitoring channels.
- 1003:  
Reference tolerance exceeded.  
When the user agreement is set, the difference between the new reference point that has been determined after the system boots (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9544). In this case, the user agreement is withdrawn.
- 1004:  
Plausibility error for user agreement.  
1. If the user agreement has already been set, then the setting is initiated again. In this case, the user agreement is withdrawn.  
2. The user agreement was set, although the axis has still not been referenced.
- 1005: STO already active for test stop selection.
- 1011: Acceptance test status between the monitoring channels differ.

1012: Plausibility violation of the encoder actual value.  
 1014: fault when synchronizing the SGA for the "Safe cam" function  
 1015: Gearbox switchover (bit 27 in PROFIsafe telegram) takes longer than 2 min.  
 1020: Cyc. communication failure between the monit. channels.  
 1021: Cyc. communication failure between the monit. channel and Sensor Module.  
 1022: Sign-of-life error for DRIVE-CLiQ encoders monitoring channel 1.  
 1023: Error in the effectiveness test in the DRIVE-CLiQ encoder  
 1024: Sign-of-life error for HTL/TTL encoders.  
 1032: Sign-of-life error for DRIVE-CLiQ encoders monitoring channel 2.  
 1033: Error checking offset between POS1 and POS2 for DRIVE-CLiQ encoder monitoring channel 1.  
 1034: Error checking offset between POS1 and POS2 for DRIVE-CLiQ encoder monitoring channel 2.  
 1039: Overflow when calculating the position.  
 1041: Current absolute value too low (encoderless)  
 1042: Current/voltage plausibility error  
 1043: Too many acceleration phases  
 1044: Current actual values plausibility error.  
 5000 ... 5140:  
 PROFIsafe message values.  
 For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions.  
 5000, 5014, 5023, 5024, 5030 ... 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ...  
 5125, 5132 ... 5135, 5140: an internal software error has occurred (only for internal Siemens fault diagnostics).  
 5012: Error when initializing the PROFIsafe driver.  
 5013: The result of the initialization is different for the two controllers.  
 5022: Error when evaluating the F parameters. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.  
 5025: The result of the F parameterization is different for the two controllers.  
 5026: CRC error for the F parameters. The transferred CRC value of the F parameters does not match the value calculated in the PST.  
 5065: A communications error was identified when receiving the PROFIsafe telegram.  
 5066: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.  
 6000 ... 6166:  
 PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).  
 For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "Stop B after failure of the PROFIsafe communication" (9612) is parameterized, the transfer of the Failsafe Values is delayed.  
 The significance of the individual message values is described in safety fault F01611.  
 7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).  
 7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).  
 7002: Cycle counter for transferring the safe position is different in both monitoring channels.  
 7003: error when providing the data for the "Synchronous safe position via PROFIsafe" function.  
 7004: PROFIsafe clock cycle not correctly synchronized to the DP clock cycle.  
 See also: p9555 (SI Motion transition time STOP F to STOP B (Control Unit)), r9725 (SI Motion diagnostics STOP F)

**Remedy:**

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

For message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for HM: C30711).

For message value = 3:

Commissioning phase:

- check the encoder parameters, and if required, correct (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).

In operation:

- check the mechanical design and the encoder signals.

For message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with message value 5 from the other monitoring channel (with HM: C30711), the monitoring clock cycle settings must be increased.

For message value = 11 ... 14:

- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.

For message value = 232:

- increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

For message value = 274, 275:

- increase the cam tolerance p9540/p9340 and/or the position tolerance p9542/p9342.

For message value = 278, 279, 280, 281:

- check as to whether the same acceleration limit has been set for both channels. A different result depends on whether SLA is enabled and not selected - or enabled and selected. In this case, another message value is possible.

For message value = 1 ... 999:

- if the message value is listed under cause: Check the cross-checked parameters to which the message value refers.
- copy the safety parameters.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Hydraulic Module software.
- upgrade the Control Unit software.
- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Note:

For SINAMICS firmware version  $\geq 4.7$ , the KDV list is increased when setting p9567  $> 0$ . For a non-compatible version of SINUMERIK this can lead to an error for the data cross-check (is indicated with message value  $\geq 237$ ). If necessary, p9567 must be set = 0, or the firmware version of SINUMERIK upgraded.

For message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

For message value = 1001:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Hydraulic Module software.
- upgrade the Control Unit software.

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.
- increase the tolerance for the actual value comparison when referencing (p9544).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005: deselect checking the conditions for STO.

For message value = 1007:

- check the PLC for the correct operating state (run state, basic program).

For message value = 1008:

- check whether incorrect or overlapping address ranges have been set in SINUMERIK machine data MD10393.

For message value = 1011:

- for diagnostics, refer to parameter (r9571).

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.
- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).
- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.
- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.
- the parameterized encoder does not correspond to the connected encoder - replace the encoder.
- check the electrical cabinet design and cable routing for EMC compliance
- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

For message value = 1014:

- check the encoder actual values. If required, increase the position tolerance (p9542) and/or cam tolerance (p9540).

For message value = 1020, 1021, 1024:

- check the communication link.
- if required, increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

For message value = 1033:

- if required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

For message value = 1039:

- check the conversion factors such as spindle pitch or gearbox ratios.

For message value = 1041:

- check whether the motor has sufficient current (>r9785[0]).
- reduce the minimum current (p9588).
- for synchronous motors increase the absolute value of p9783.
- check whether the function "Closed-loop controlled operation with HF signal injection" is activated (p1750.5 = 1) and if required, deactivate.

For message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.
- check the absolute current and voltage values, and set the control behavior so that this is greater than 3% of the rated converter data in operation or in the case of a fault.
- increase the minimum current (p9588).

For message value = 1043:

- increase the voltage tolerance (p9589). When operating a reluctance motor, the controller settings are generally set to be more dynamic. If this message is output for the factory setting of p9589, then the acceleration limit should be increased as countermeasure (p9589 = 500 ... 1000 %). From experience, this provides a rugged response.
- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.

For message value = 5000, 5014, 5023, 5024, 5030, 5031, 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Hydraulic Module involved and, if required, carry out a diagnostics routine for the faults identified.
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For message value = 5012:

- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the hydraulic module (p9810). It is not permissible for the PROFIsafe address to be 0 or FFFF!

For message value = 5013, 5025:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the hydraulic module (p9810).
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Hydraulic Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5022:

- check the setting of the values of the F parameters at the PROFIsafe slave (F\_SIL, F\_CRC\_Length, F\_Par\_Version, F\_Source\_Add, F\_Dest\_add, F\_WD\_Time).

For message value = 5026:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and update.

For message value = 5065:

- check the configuration and communication at the PROFIsafe slave (cons. No. / CRC).
- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Hydraulic Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5066:

- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.

For message value = 6000 ... 6999:

Refer to the description of the message values in safety fault F01611.

For message value = 7000:

- increase the position tolerance (p9542/p9342).
- determine the actual position of CU (r9713[0] and the second channel r9713[1], and check the difference for plausibility.
- reduce the difference of the actual position from CU (r9713[0] and the second channel r9713[1] for a 2-encoder system.

For message value = 7001:

- increase the scaling value for the safe position in the 16 bit notation (p9574/p9374).
- if required, reduce the traversing range.

For message value = 7002:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Hydraulic Module involved and, if required, carry out a diagnostics routine for the faults identified.

This message can be acknowledged as follows:

- motion monitoring functions integrated in the drive: Via Terminal Module 54F (TM54F) or PROFIsafe
- motion monitoring functions with SINUMERIK: Via the machine control panel

For message value = 7003, 7004:

- if required, adapt the settings for the times for Tdp, Ti and To - or increase the monitoring clock cycle p9500 (rule Tdp = 2 x n x p9500, n= 1, 2, 3, ...).

## 201711 <location>SI Motion P1 (CU): Defect in a monitoring channel

Drive object: SERVO\_828, SERVO\_COMBI

Message value: %1

**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:**

When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

If at least one monitoring function is active, then after the parameterized timer has expired, the message C01701 "SI Motion: STOP B initiated" is output.

The message value that resulted in a STOP F is displayed in r9725.

If the drive is operated together with a SINUMERIK, the message values are described in message 27001 of SINUMERIK, with the exception of the following message values, which can only occur in SINAMICS:

1007: communication error with the PLC (sign-of-life).

1008: communication error with the PLC (CRC).

The following described message values involve the data cross-check between the two monitoring channels (safety functions integrated in the drive).

The message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:

- cycle times not uniformly parameterized (p9500/p9300 and p9511/p9311)
- differently parameterized axis types (p9502/p9302).
- excessively fast cycle times (p9500/p9300, p9511/p9311).
- For message values 3, 44 ... 57, 232 and 1-encoder system, differently set encoder parameters.
- For message values 3, 44 ... 57, 232 and 2-encoder system, encoder parameters that have not been correctly set.
- incorrect synchronization.

Message value (r9749, interpret decimal):

0 to 999: Number of the cross-compared data that resulted in this fault.

Message values that are not subsequently listed are only for internal Siemens troubleshooting.

0: Stop request from another monitoring channel.

1: Status image of monitoring functions SOS, SLS, SAM/SBR, SDI, SLA or SLP (result list 1) (r9710[0], r9710[1]).

2: Status image of monitoring function SCA or n < nx (result list 2) (r9711[0], r9711[1]).

3: The position actual value differential (r9713[0/1]) between the two monitoring channels is greater than the tolerance in p9542/p9342. When actual value synchronization is enabled (p9501.3/p9301.3), the velocity differential (based on the position actual value) is greater than the tolerance in p9549/p9349.

4: Error when synchronizing the data cross-check between the two channels.

5: Enable safe functions (p9501/p9301). Safety monitoring clock cycle too small (p9500/p9300).

6: Limit value for SLS1 (p9531[0]/p9331[0])

7: Limit value for SLS2 (p9531[1]/p9331[1])

8: Limit value for SLS3 (p9531[2]/p9331[2])

9: Limit value for SLS4 (p9531[3]/p9331[3])

10: Standstill tol. (p9530/p9330)

11: Upper limit value for SLP1 (p9534[0]/p9334[0]).

12: Lower limit value for SLP1 (p9535[0]/p9335[0]).

13: Upper limit value for SLP2 (p9534[1]/p9334[1]).

14: Lower limit value for SLP2 (p9535[1]/p9335[1]).

15: Upper limit value for SCA, cam 1 plus position (p9536[0]/p9336[0]+p9540/p9340)

16: Lower limit value for SCA, cam 1 plus position (p9536[0]/p9336[0])

17: Upper limit value for SCA, cam 1 minus position (p9537[0]/p9337[0]+p9540/p9340)

18: Lower limit for SCA, cam 1 minus position (p9537[0]/p9337[0])

19...30: limit value SCA, cams 2 to 4. Refer above fault values 15 to 18 for cam 1

31: Position tolerance (p9542/p9342) or (p9549/p9349) when actual value synchronization is enabled (p9501.3/p9301.3)

32: Position tolerance for safe referencing (p9544/p9344).

33: Time, velocity changeover (p9551/p9351)

35: Delay time, STOP A (p9556/p9356)

36: Checking time, STO (p9557/p9357)

37: Trans. time, STOP C to SOS (p9552/p9352)

38: Trans. time STOP D to SOS (p9553/p9353)

39: Trans. time, STOP E to SOS (p9554/p9354)

40: Stop response for SLS (p9561/p9361).

41: Stop response for SLP1 (p9562[0]/p9362[0]).

42: Shutdown speed, STO (p9560/p9360)

43: Memory test stop response (STOP A).

44 ... 57: General

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

Permissible deviation between the two monitoring channels: p9542/p9342.

44: Position actual value (r9713[0/1]) + limit value SLS1 (p9531[0]/p9331[0]) \* safety monitoring clock cycle (p9500/p9300).

45: Position actual value (r9713[0/1]) - limit value SLS1 (p9531[0]/p9331[0]) \* safety monitoring clock cycle (p9500/p9300).

46: Position actual value (r9713[0/1]) + limit value SLS2 (p9531[1]/p9331[1]) \* safety monitoring clock cycle (p9500/p9300).

47: Position actual value (r9713[0/1]) - limit value SLS2 (p9531[1]/p9331[1]) \* safety monitoring clock cycle (p9500/p9300).

48: Position actual value (r9713[0/1]) + limit value SLS3 (p9531[2]/p9331[2]) \* safety monitoring clock cycle (p9500/p9300).

49: Position actual value (r9713[0/1]) - limit value SLS3 (p9531[2]/p9331[2]) \* safety monitoring clock cycle (p9500/p9300).

50: Position actual value (r9713[0/1]) + limit value SLS4 (p9531[3]/p9331[3]) \* safety monitoring clock cycle (p9500/p9300).

51: Position actual value (r9713[0/1]) - limit value SLS4 (p9531[3]/p9331[3]) \* safety monitoring clock cycle (p9500/p9300).

52: Standstill position + tolerance (p9530/p9330)

53: Standstill position - tolerance (p9530/p9330)

54: Position actual value (r9713[0/1]) + limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300) + tolerance (p9542/p9342).

55: Position actual value (r9713[0/1]) + limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300).

56: Position actual value (r9713[0/1]) - limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300).

57: Position actual value (r9713[0/1]) - limit value nx (p9546/p9346) \* safety monitoring clock cycle (p9500/p9300) - tolerance (p9542/p9342).

58: Actual stop request.

75: Velocity limit nx (p9546, p9346).

When the function "n < nx: hysteresis and filtering" (p9501.16 = 1) is enabled, this message value is also output for a different hysteresis tolerance (p9547/p9347).

76: Stop response for SLS1 (p9563[0]/p9363[0]).

77: Stop response for SLS2 (p9563[1]/p9363[1]).

78: Stop response for SLS3 (p9563[2]/p9363[2]).

79: Stop response for SLS4 (p9563[3]/p9363[3]).

80: Modulo value for SP for rotary axes (p9505/p9305).

81: Velocity tolerance for SAM (p9548/p9348)

82: SGEs for SLS correction factor.

83: Acceptance test timer (p9558/p9358)

84: Trans. time STOP F (p9555/p9355)

85: Trans. time bus failure (p9580/p9380)

86: ID 1-encoder system (p9526/p9326).

87: Encoder assignment, second channel (p9526/p9326)

88: SCA (SN) enable (p9503/p9303).

89: Encoder limit freq.

90: Upper limit value for SCA, cam 5 plus position (p9536[4]/p9336[4]+p9540/p9340).

91: Lower limit value for SCA, cam 5 plus position (p9536[4]/p9336[4]).

- 92: Upper limit value for SCA, cam 5 minus position (p9537[4]/p9337[4]+p9540/p9340).
- 93: Lower limit for SCA, cam 5 minus position (p9537[4]/p9337[4]).
- 94...224: limit value SCA, cams 6 to 30. See above, fault values 90 to 93 for cam 5.
- 225...229: Status screens of the monitoring function SCA (result lists 3...7).
- 230: Filter time constant for  $n < nx$ .
- 231: Hysteresis tolerance for  $n < nx$ .
- 232: Smoothed velocity actual value.
- 233: Limit value  $nx$  / safety monitoring clock cycle + hysteresis tolerance.
- 234: Limit value  $nx$  / Safety monitoring clock cycle.
- 235: -Limit value  $nx$  / Safety monitoring clock cycle.
- 236: -Limit value  $nx$  / safety monitoring clock cycle - hysteresis tolerance.
- 237: SGA  $n < nx$ .
- 238: speed limit value for SAM (p9568/p9368 or p9346/p9346).
- 239: Acceleration for SBR (p9581/p9381 and p9583/p9383).
- 240: Inverse value of acceleration for SBR (p9581/p9381 and p9583/p9383).
- 241: Deceleration time for SBR (p9582/p9382).
- 242: Function specification (p9506/p9306).
- 243: Function configuration (p9507/p9307).
- 244: Encoderless actual value sensing filter time (p9587/p9387).
- 245: Encoderless actual value sensing minimum current (p9588/p9388).
- 246: Voltage tolerance acceleration (p9589/p9389).
- 247: SDI tolerance (p9564/p9364).
- 248: SDI positive upper limit (7FFFFFFF hex).
- 249: Position actual value (r9713[0/1]) - SDI tolerance (p9564/p9364).
- 250: Position actual value (r9713[0/1]) + SDI tolerance (p9564/p9364).
- 251: SDI negative lower limit (80000001 hex).
- 252: SDI stop response (p9566/p9366).
- 253: SDI delay time (p9565/p9365).
- 254: Setting the evaluation delay for actual value sensing after pulse enable (p9586/p9386).
- 255: Setting, behavior during pulse suppression (p9509/p9309).
- 256: Status image of monitoring functions SOS, SLS, SLP, test stop, SBR, SDI (result list 1 ext) (r9710).
- 257: Safety functions for motion monitoring functions without selection (p9512/p9312) different.
- 258: Fault tolerance, actual value sensing encoderless (p9585/p9385).
- 259: Scaling factor for safe position via PROFIsafe (p9574/p9374) or PROFIsafe telegram (p9611/p9811) different.
- 260: Modulo value including scaling (p9505/p9305 and p9574/p9374) for SP with 16 bit.
- 261: Scaling factor for acceleration for SBR different.
- 262: Scaling factor for the inverse value of the acceleration for SBR different.
- 263: Stop response for SLP2 (p9562[1]/p9362[1])
- 264: Position tolerance including scaling (p9542/p9342 and p9574/p9374) for SP with 16 bit.
- 265: Status image of all change functions (results list 1) (r9710).
- 266: The switchover speed to SOS differs (p9567/p9367).
- 267: The transition time to SOS after standstill differs (p9569/p9369).
- 268: SLP delay time differs (p9577/p9377).
- 269: Factor to increase the position tolerance when switching over the gearbox stage (p9543/p9343).
- 270: Screen form for SGE image: all functions, which are not supported/enabled for the actual parameterization (p9501/p9301, p9601/p9801 and p9506/p9306)..
- 271: Screen form for SGE image: Deselect all bits for the "Safe gearbox switchover" function.
- 272: activation of the increased position tolerance for the "Safe gearbox switchover" function different (p9568/p9368 or p9346/p9346 or "0").
- 273: speed limit value for flattening the ramp for SAM/SBR different.
- 274: SGA SCA, cams 1 to 15.
- 275: SGA SCA, cams 16 to 30.
- 276: Limit value for SLA1 (p9578/p9378).

277: Stop response for SLA1 (p9579/p9379).

278: Upper limit value for SLA1.

279: Lower limit value for SLA1.

280: Upper limit value for SLA1 (fine resolution).

281: Lower limit value for SLA1 (fine resolution).

282: SLA filter time.

283: Acceleration actual value (fine resolution).

1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.

1001: Initialization error of watchdog timer.

1002:

User agreement after the timer has expired different.

The user agreement is not consistent. After a time of 4 s has expired, the status of the user agreement is different in both monitoring channels.

1003:

Reference tolerance exceeded.

When the user agreement is set, the difference between the new reference point that has been determined after the system boots (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9544). In this case, the user agreement is withdrawn.

1004:

Plausibility error for user agreement.

1. If the user agreement has already been set, then the setting is initiated again. In this case, the user agreement is withdrawn.

2. The user agreement was set, although the axis has still not been referenced.

1005:

- for safe motion monitoring functions without encoder: pulses already suppressed for test stop selection.

- for safe motion monitoring functions with encoder: STO already active for test stop selection.

1011: Acceptance test status between the monitoring channels differ.

1012: Plausibility violation of the encoder actual value.

1014: Error when synchronizing the SGA for the "Safe cam" function.

1015: Gearbox switchover (bit 27 in PROFIsafe telegram) takes longer than 2 min.

1020: Cyc. communication failure between the monit. channels.

1021: Cyc. communication failure between the monit. channel and Sensor Module.

1022: Sign-of-life error for DRIVE-CLiQ encoders monitoring channel 1.

1023: Error in the effectiveness test in the DRIVE-CLiQ encoder

1024: Sign-of-life error for HTL/TTL encoders.

1032: Sign-of-life error for DRIVE-CLiQ encoders monitoring channel 2.

1033: Error checking offset between POS1 and POS2 for DRIVE-CLiQ encoder monitoring channel 1.

1034: Error checking offset between POS1 and POS2 for DRIVE-CLiQ encoder monitoring channel 2.

1035: offset between POS1 and POS2 for DRIVE-CLiQ encoder on one of the monitoring channels has changed since the last commissioning.

1039: Overflow when calculating the position.

1041: Current absolute value too low (encoderless)

1042: Current/voltage plausibility error

1043: Too many acceleration phases

1044: Current actual values plausibility error.

5000 ... 5140:

PROFIsafe message values.

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions.

5000, 5014, 5023, 5024, 5030 ... 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:

An internal software error has occurred (only for internal Siemens troubleshooting).

5012: Error when initializing the PROFIsafe driver.

5013: The result of the initialization is different for the two controllers.

5022: Error when evaluating the F parameters. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.

5025: The result of the F parameterization is different for the two controllers.

5026: CRC error for the F parameters. The transferred CRC value of the F parameters does not match the value calculated in the PST.

5065: A communications error was identified when receiving the PROFIsafe telegram.

5066: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "Stop B after failure of the PROFIsafe communication" (p9612) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety fault F01611.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

7003: error when providing the data for the "Synchronous safe position via PROFIsafe" function.

7004: PROFIsafe clock cycle not correctly synchronized to the DP clock cycle.

See also: p9555 (SI Motion transition time STOP F to STOP B (Control Unit)), r9725 (SI Motion diagnostics STOP F)

**Remedy:**

The following generally applies:

The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.

For message value = 0:

- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for MM: C30711).

For message value = 3:

Commissioning phase:

- check the encoder parameters, and if required, correct (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).

In operation:

- check the mechanical design and the encoder signals.
- if closed-loop control with edge modulation is parameterized (p1802[x] = 9): parameterize edge modulation for actual value sensing without encoder (p9507.5 = p9307.5 = 1).

For message value = 4:

The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with message value 5 from the other monitoring channel (with MM: C30711), the monitoring clock cycle settings must be increased.

For message value = 11 ... 14:

- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.

For message value = 15 ... 30 and 90 ... 229:

- the cam positions for function SCA in p9536/p9336, p9537/p9337 or the cam tolerance p9540/p9340 are not equal. Correct the values. Increase the cam tolerance p9540/p9340.

For message value = 232:

- increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).

For message value = 274, 275:

- increase the cam tolerance p9540/p9340 and/or the position tolerance p9542/p9342.

For message value = 278, 279:

- check as to whether the same acceleration limit has been set for both channels. A different result depends on whether SLA is enabled and not selected - or enabled and selected. In this case, another message value is possible.

For message value = 1 ... 999:

- if the message value is listed under cause: Check the cross-checked parameters to which the message value refers.
- copy the safety parameters.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.
- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Note:

For SINAMICS firmware version  $\geq 4.7$ , the KDV list is increased when setting p9567  $> 0$ . For a non-compatible version of SINUMERIK this can lead to an error for the data cross-check (is indicated with message value  $\geq 237$ ). If necessary, p9567 must be set = 0, or the firmware version of SINUMERIK upgraded.

For message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

For message value = 1001:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.
- increase the tolerance for the actual value comparison when referencing (p9544).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005:

- for safe motion monitoring functions without encoder: check the conditions for pulse enable.
- for safe motion monitoring functions with encoder: check the conditions for STO deselection.

Note:

For a Power Module, the test stop should always be performed when the pulses are enabled (independent of whether with encoder or without encoder).

For message value = 1007:

- check the PLC for the correct operating state (run state, basic program).

For message value = 1008:

- check whether incorrect or overlapping address ranges have been set in SINUMERIK machine data MD10393.

For message value = 1011:

- for diagnostics, refer to parameter (r9571).

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.
- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).
- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.
- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.
- the parameterized encoder does not correspond to the connected encoder - replace the encoder.
- check the electrical cabinet design and cable routing for EMC compliance
- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

For message value = 1014:

- check the encoder actual values. If required, increase the position tolerance (p9542) and/or cam tolerance (p9540).

For message value = 1020, 1021, 1024:

- check the communication link.
- if required, increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

For message value = 1033, 1034:

- if required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

For message value = 1035, if one of the safety encoders was replaced:

- confirm the hardware replacement (p9700 = 29, p9701 = 236 or p9702 = 29).
- save all parameters (p0977 = 1 or p0971 = 1 or "copy RAM to ROM").
- acknowledge fault (e.g. binector input p2103).

For message value = 1039:

- check the conversion factors such as spindle pitch or gearbox ratios.

For message value = 1041:

- check whether the motor has sufficient current (>r9785[0]).
- reduce the minimum current (p9588).
- for synchronous motors increase the absolute value of p9783.
- check whether the function "Closed-loop controlled operation with HF signal injection" is activated (p1750.5 = 1) and if required, deactivate.

For message value = 1042:

- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).

- reduce the dynamic response of the setpoint value.
- check the absolute current and voltage values, and set the control behavior so that this is greater than 3% of the rated converter data in operation or in the case of a fault.
- increase the minimum current (p9588).

For message value = 1043:

- increase the voltage tolerance (p9589). When operating a reluctance motor, the controller settings are generally set to be more dynamic. If this message is output for the factory setting of p9589, then the acceleration limit should be increased as countermeasure (p9589 = 500 ... 1000 %). From experience, this provides a rugged response.
- increase the ramp-function generator ramp-up/down time (p1120/p1121).
- check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
- reduce the dynamic response of the setpoint value.

For message value = 5000, 5014, 5023, 5024, 5030, 5031, 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For message value = 5012:

- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810). It is not permissible for the PROFIsafe address to be 0 or FFFF!

For message value = 5013, 5025:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5022:

- check the setting of the values of the F parameters at the PROFIsafe slave (F\_SIL, F\_CRC\_Length, F\_Par\_Version, F\_Source\_Add, F\_Dest\_add, F\_WD\_Time).

For message value = 5026:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and update.

For message value = 5065:

- check the configuration and communication at the PROFIsafe slave (cons. No. / CRC).
- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5066:

- check the setting of the value for F parameter F\_WD\_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.

For message value = 6000 ... 6999:

Refer to the description of the message values in safety fault F01611.

For message value = 7000:

- increase the position tolerance (p9542/p9342).
- determine the actual position of CU (r9713[0]) and the second channel r9713[1], and check the difference for plausibility.
- reduce the difference of the actual position from CU (r9713[0]) and the second channel r9713[1] for a 2-encoder system.

For message value = 7001:

- increase the scaling value for the safe position in the 16 bit notation (p9574/p9374).
- if required, reduce the traversing range.

For message value = 7002:

- carry out a POWER ON (switch-off/switch-on) for all components.

- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- Terminal Module 54F (TM54F).

- onboard F-DI (only CU310-2).

- PROFIsafe.

- machine control panel.

For message value = 7003, 7004:

- if required, adapt the settings for the times for Tdp, Ti and To - or increase the monitoring clock cycle p9500 (rule Tdp = 2 x n x p9500, n= 1, 2, 3, ...).

**201712      <location>SI Motion P1 (CU): Defect in F-IO processing**

**Drive object:**      SERVO\_828, SERVO\_COMBI

**Message value:**    %1

**Reaction:**          NONE

**Acknowledge:**      IMMEDIATELY (POWER ON)

**Cause:** When cross checking and comparing the two monitoring channels, the drive detected a difference between parameters or results of the F-IO processing and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

The safety message C01711 with message value 0 is also displayed due to initiation of STOP F.

If at least one monitoring function is active, the safety message C01701 "SI Motion: STOP B initiated" is output after the parameterized timer has expired.

Message value (r9749, interpret decimal):

Number of the cross-compared data that resulted in this message.

- 1: SI discrepancy monitoring time inputs (p10002, p10102).
- 2: SI acknowledgment internal event input terminal (p10006, p10106).
- 3: SI STO input terminal (p10022, p10122).
- 4: SI SS1 input terminal (p10023, p10123).
- 5: SI SS2 input terminal (p10024, p10124).
- 6: SI SOS input terminal (p10025, p10125).
- 7: SI SLS input terminal (p10026, p10126).
- 8: SI SLS\_Limit(1) input terminal (p10027, p10127).
- 9: SI SLS\_Limit(2) input terminal (p10028, p10128).
- 10: SI Safe State signal selection (p10039, p10139).
- 11: SI F-DI input mode (p10040, p10140).
- 12: SI F-DO 0 signal sources (p10042, p10142).
- 13: Different states for static inactive signal sources (p10006, p10022 ... p10031).
- 14: SI discrepancy monitoring time outputs (p10002, p10102).
- 15: SI acknowledgment internal event (p10006, p10106).
- 16: SI test sensor feedback signal test mode selected for test stop (p10046, p10146, p10047, p10147).
- 17: SI delay time for test stop at DOs (p10001).
- 18 ... 25: SI test sensor feedback signal (p10046, p10146, p10047, p10147). Expected state of internal readback signal, generated from the selected test stop mode.
- 26 ... 33: SI test sensor feedback signal (p10046, p10146, p10047, p10147). Expected state of external readback signal, generated from the selected test stop mode.
- 34 ... 41: SI test sensor feedback signal (p10046, p10146, p10047, p10147). Expected state of second internal readback signal, generated from the selected test stop mode.
- 42: Internal data for processing the second internal readback signal, generated from the selected test stop mode (p10047, p10147).
- 43: Internal data for processing the internal readback signal, generated from the selected test stop mode (p10047, p10147).
- 44: Internal data for processing the external readback signal, generated from the selected test stop mode (p10047, p10147).
- 45: Internal data for initialization state of test stop mode, dependent upon test stop parameters.
- 46: SI digital inputs debounce time (p10017, p10117)
- 47: Selection F-DI for PROFIsafe (p10050, p10150)
- 48: Screen form of the F-DIs used (p10006, p10022 ... p10031).
- 49: SI SDI positive input terminal (p10030, p10130).
- 50: SI SDI negative input terminal (p10031, p10131).
- 51: SI SLP input terminal (p10032, p10132).
- 52: SI SLP select input terminal (p10033, p10133).
- 53: Internal data for retraction logic (p10009, p100109).
- 54: SI F-DI for retraction SLP (p10009, p100109).

**Remedy:**

- check parameterization in the parameters involved and correct if required.
- ensure equality by copying the SI data to the second channel and then carry out an acceptance test.
- check monitoring clock cycle in p9500 and p9300 for equality.

This message can be acknowledged without a POWER ON as follows (safe acknowledgment):

- onboard F-DI (only CU310-2).
- PROFIsafe.
- machine control panel.

## 201783 <location>SBT brake closing time exceeded

|                       |                        |
|-----------------------|------------------------|
| <b>Drive object:</b>  | SERVO_828, SERVO_COMBI |
| <b>Message value:</b> | Fault cause: %1 bin    |
| <b>Reaction:</b>      | NONE                   |
| <b>Acknowledge:</b>   | NONE                   |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>  | The maximum time (11 s) to close the brake during the brake test was exceeded.<br>Alarm value (r2124, interpret binary):<br>Bit 0 = 1:<br>Internal brake was not able to be closed.<br>Bit 1 = 1:<br>External brake was not able to be closed.<br>Note:<br>SBT: Safe Brake Test                                                                                                                                                 |
| <b>Remedy:</b> | - When using an external brake, check that the feedback signal "brake closed" is correctly interconnected with the control word of the brake test (p10230.5, p10235.5).<br>- When using an internal brake with external feedback signal, check whether the feedback signal is correctly interconnected with the extended brake control.<br>- carry out a safe acknowledgment.<br>- restart the brake test (p10230.1, p10235.1). |

---

**201784 <location>SBT brake test canceled with fault**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The safe brake test was canceled as a result of a fault.

Alarm value (r2124, interpret binary):

Bit 17 = 1: fault in the brake test sequence (cause, see bits 0 ... 10).

Bit 18 = 1: the internal brake is closed. It must be open when the external brake is tested (p10202).

Bit 19 = 1: the external brake is closed. It must be open when the internal brake is tested (p10202).

Bit 20 = 1: not all brakes are open (p10202).

Bit 21 = 1: axis position during the brake test not valid due to parking axis.

Bit 22 = 1: internal software error.

Bit 23 = 1: the permissible position range of the axis was violated with the brake closed (p10212/p10222).

Bit 24 = 1: the tested internal brake was opened while the brake test was active.

Bit 25 = 1: the tested external brake was opened while the brake test was active.

Bit 26 = 1: during the active brake test, the test torque left its tolerance bandwidth (20 %).

Cause for alarm value bit 17:

Bit 0 = 1: operation when selecting the brake test not enabled (r0899.2 = 0).

Bit 1 = 1: external fault occurred (e.g. the brake test that has already started is canceled by the user).

Bit 2 = 1: when selecting the brake test a brake is closed.

Bit 3 = 1: when determining the load torque a brake is closed.

Bit 4 = 1: A fault has occurred with stop response (e.g. OFF1, OFF2 or OFF3) - or the pulse enable was withdrawn (e.g. STO selected or operation no longer enabled).

Bit 5 = 1: when selecting the brake test the axis speed setpoint is too high.

Bit 6 = 1: the actual speed (r0063) of the axis is too high (e.g. brake does not hold during the brake test).

Bit 7 = 1: Incorrect speed controller mode (e.g. encoderless speed control or U/f operation).

Bit 8 = 1: closed-loop control not enabled or function generator active.

Bit 9 = 1: control does not switch over to the brake test (e.g. because PI speed control has not been parameterized).

Bit 10 = 1: torque limit reached (r1407.7, r1408.8).

Note:

SBT: Safe Brake Test

**Remedy:**

- remove the fault cause.
- carry out a safe acknowledgment.
- if required, restart the brake test.

For bit 17 = 1 with bit 6 = 1 or bit 23 = 1:  
 If the brake closing time of the motor holding brake (p1217) has been set too low, then at the start of the brake test, the brake is closed too late. The brake closing time should be adapted (p1217).

---

#### 201785 <location>SBT brake test configuration error

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Error when parameterizing the brake test.  
 In this configuration, the brake test cannot be started or cannot be started without error.  
 Alarm value (r2124, interpret decimal):

1:  
 No motion monitoring functions have been enabled.

2:  
 Two internal brakes were configured (p10202).

4:  
 No internal brakes were configured (p10202).

8:  
 The brake test is configured for an internal brake, however the safety brake control is not enabled (p9602/p9802).

Note:  
 From firmware version 5.1, SBT without SBC is also permitted for the internal brake.

16:  
 The safe brake test and Safety without encoder are simultaneously enabled (p9306/p9506). This is not permissible.

32:  
 The Safe Brake Test and vector U/f control is enabled. The safe brake test is not possible in this control mode.

Note:  
 SBC: Safe Brake Control  
 SBT: Safe Brake Test

**Remedy:** Check parameterization of the brake test.

---

#### 201786 <location>SCC signal source changed

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The signal source in p10235 or p10250 was changed.  
 The new signal source is effective immediately.

Note:  
 SCC: Safety Control Channel  
 See also: p10235 (SI Safety Control Channel control word S\_STW3B), p10250 (SI Safety Control Channel control word S\_STW1B)

**Remedy:** Acknowledge fault.

---

#### 201787 <location>SBT motor type different

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The motor type set for the safe brake test (p10204) does not match the motor type set via the function module (r0108.12).

**Remedy:** Adapt the motor type set for the safe brake test.

Note:

All of the parameters for the brake test, whose unit depends on the motor type, should be checked.

See also: p10204, p10209

---

**201788 <location>SI: Automatic test stop waits for STO deselection via motion monitoring functions**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The automatic test stop (forced checking procedure) was not able to be carried out after powering up.

Possible causes:

- the STO function is selected via safe motion monitoring functions.

- a safety message is present, that resulted in a STO.

Note:

STO: Safe Torque Off

**Remedy:** - deselect STO via safe motion monitoring functions.

- remove the cause of the safety messages and acknowledge the messages.

Note:

The automatic test stop is performed after removing the cause.

---

**201789 <location>SI: Automatic test stop and brake test when test stop is selected not permitted**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The parameterization of the automatic test stop (p9507.6/p9307.6) and the brake test when a test stop is selected (p10203 = 2) are not permissible.

The test stop is not automatically carried out when the powering up.

**Remedy:** - correct the parameter assignment.

- set p10203 not equal to 2 or deactivate the automatic test stop.

Note:

A warm restart or POWER ON is required to carry out the automatic test stop.

---

**201794 <location>SI Motion: check modulo value for safe position via PROFIsafe**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When parameterizing the modulo value for safe position via PROFIsafe (p9505) the position actual value can jump when the range that can be represented overflows.

Range that can be represented:

- 32-bit value: +/- 2048 revolutions

- 16-bit value: +/- 2048 revolutions (depending on p9574)

**Remedy:** Correct the parameter assignment.  
 Set p9505 to  $2^n$  revolutions - and to complete revolutions (i.e. a multiple of  $360^\circ$ ).  
**Note:**  
 This alarm can be hidden for the case that the possible position actual value jump can be tolerated for the particular application, or does not represent a problem; for example because the parameterized modulo range fits "almost as integer number" in the range of  $\pm 2048$  revolutions that can be represented.  
 To re-parameterize the alarm to "NO REPORT", it is not permissible that the alarm is present. As a consequence, the following sequence is required for the re-parameterization:  
 - correct p9505 to  $2^n$ .  
 - re-parameterize the alarm using p2118 and p2119.  
 - set p9505 back to the required value.

---

**201795 <location>SI Motion P1 (CU): Wait time after exiting the safe pulse cancellation expired**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** After exiting safe pulse cancellation, within the wait time of 5 seconds, encoderless actual value sensing was not able to be activated for the extended functions without selection.  
 A change is again made into the "safe pulse cancellation" state.

**Remedy:** - check missing enable signals, which prevent the drive control from being commissioned (r0046).  
 - evaluate possible fault messages of the encoderless actual value sensing and remove.

---

**201796 <location>SI P1 (CU): Wait for communication**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The drive waits for communication to be established to execute the safety-relevant motion monitoring functions.

**Note:**

STO is active in this state.

Alarm value (r2124, interpret decimal):

1: Wait for communication to be established to SINUMERIK.

2: Wait for communication to be established to TM54F.

3: Wait for communication to be established to PROFIsafe F-Host.

**Remedy:** If, after a longer period of time, the message is not automatically withdrawn, the following checks have to be made as appropriate:  
For communication with SINUMERIK, the following applies:  
- check any other PROFIBUS messages/signals present and remove their cause.  
- check that assignment of the axes on the higher-level control to the drives in the drive unit is correct.  
- check enable signal of the safety-relevant motion monitoring functions for the corresponding axis on the higher-level control and if required, set it.  
For communication with TM54F, the following applies:  
- check any other messages/signals present for DRIVE-CLiQ communication with the TM54F and remove their cause.  
- check the setting of p10010. All the drive objects controlled by the TM54F must be listed.  
For communication with PROFIsafe F-Host, the following applies:  
- evaluate any other PROFIsafe communication messages/signals present.  
- check the operating state of the F-Host.  
- check the communication connection to the F Host.  
- check the communication connection to the Motor Module/Hydraulic Module. It must be ensured that when the Control Unit powers up, the Motor Module/Hydraulic Module is connected and at the latest is also switched-on with the Control Unit. Otherwise, if the Motor Module/Hydraulic Module is subsequently inserted or switched on, a POWER ON must be performed at the Control Unit.  
Note:  
STO: Safe Torque Off  
See also: p9601, p9801, p10010

---

**201797 <location>SI Motion P1 (CU): Axis not safely referenced**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The standstill position saved before switching off does not match the actual position determined at switch-on.  
Message value (r9749, interpret decimal):  
1: Axis not safely referenced.  
2: User agreement missing.

**Remedy:** If safe automatic referencing is not possible the user must issue a user agreement for the new position using the softkey. This means that this position is then designated as safety-relevant.  
Note:  
SI: Safety Integrated

---

**201798 <location>SI Motion P1 (CU): Test stop for motion monitoring functions running**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The forced checking procedure (test stop) for the safe motion monitoring functions is currently in progress.

**Remedy:** Not necessary.  
The message is automatically withdrawn when the test stop has been completed.  
Note:  
SI: Safety Integrated

---

**201799 <location>SI Motion P1 (CU): Acceptance test mode active**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

| <b>Cause:</b>         | Parameterization for isochronous operation is not permissible.<br>Alarm value (r2124, interpret decimal):<br>0: Bus cycle time Tdp < 0.5 ms.<br>1: Bus cycle time Tdp > 32 ms.<br>2: Bus cycle time Tdp is not an integer multiple of the current controller sampling time.<br>3: Instant of the actual value sensing Ti > Bus cycle time Tdp or Ti = 0.<br>4: Instant of the actual value sensing Ti is not an integer multiple of the current controller sampling time.<br>5: Instant of the setpoint acceptance To >= Bus cycle time Tdp or To = 0.<br>6: Instant of the setpoint acceptance To is not an integer multiple of the current controller sampling time.<br>7: Master application cycle time Tmapc is not an integer multiple of the speed controller sampling time.<br>8: Bus reserve bus cycle time Tdp - data exchange time Tdx less than two current controller sampling times.<br>10: Instant of the setpoint acceptance To <= data exchange time Tdx + current controller sampling time<br>11: Master application cycle time Tmapc > 14 x Tdp or Tmapc = 0.<br>12: PLL tolerance window Tpll_w > Tpll_w_max.<br>13: Bus cycle time Tdp is not a multiple of all basic clock cycles p0110[x].<br>16: For COMM BOARD, the instant in time for the actual value sensing Ti is less than two current controller sampling times. |

**Remedy:**

- Adapt the bus parameterization Tdp, Ti, To.
- adapt the sampling time for the current controller or speed controller.

For alarm value = 10:

- reduce Tdx by using fewer bus participants or shorter telegrams.

## 201903 <location>COMM INT: Receive configuration data invalid

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The drive unit did not accept the receive configuration data.

Alarm value (r2124, interpret decimal):

Return value of the receive configuration data check.

1: Connection established to more drive objects than configured in the device. The drive objects for process data exchange and their sequence are defined in p0978.

2: Too many PZD data words for output or input to a drive object. The number of possible PZD items in a drive object is determined by the number of indices in r2050/p2051.

3: Uneven number of bytes for input or output.

4: Setting data for synchronization not accepted. For more information, see A01902.

5: Cyclic operation not active.

501: PROFIsafe parameter error (e.g. F\_dest).

Additional values:

Only for internal Siemens troubleshooting.

**Remedy:** Check the receive configuration data.

For alarm value = 1, 2:

Check the list of the drive objects with process data exchange (p0978). With p0978[x] = 0, all of the following drive objects in the list are excluded from the process data exchange.

For alarm value = 2:

Check the number of data words for output and input to a drive object.

For alarm value = 501:

Check the set PROFIsafe address (p9610).

---

## 201910 <location>Fieldbus: setpoint timeout

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150

**Message value:** -

**Reaction:** Infeed: OFF2 (NONE, OFF1)

Servo: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)

HLA: OFF3 (NONE, OFF1, OFF2, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** The reception of setpoints from the fieldbus interface (onboard, PROFIBUS/PROFINET/USS) has been interrupted.

- bus connection interrupted.
- controller switched off.
- controller set into the STOP state.

See also: p2040

**Remedy:** Restore the bus connection and set the controller to RUN.

Note regarding PROFIBUS slave redundancy:

For operation on a Y link, it must be ensured that "DP alarm mode = DPV1" is set in the slave parameterization.

**201911 <location>PB/PN: clock cycle synchronous operation clock cycle failure****Drive object:** 'All objects**Message value:** -**Reaction:**  
Infeed: OFF1  
Servo: OFF1 (OFF3)  
Hla: OFF1 (OFF3)**Acknowledge:** IMMEDIATELY**Cause:** The global control telegram to synchronize the clock cycles has failed - in cyclic operation - for several DP clock cycles or has violated the time grid specified in the parameterizing telegram over several consecutive DP clock cycles (refer to the bus cycle time, Tdp and Tpllw).**Remedy:**  
- check the physical bus configuration (cable, connector, terminating resistor, shielding, etc.).  
- check whether communication was briefly or permanently interrupted.  
- check the bus and controller for utilization level (e.g. bus cycle time Tdp was set too short).**Note:**

**201913 <location>COMM INT: Monitoring time sign-of-life expired****Drive object:** 'All objects**Message value:** -**Reaction:**  
Infeed: OFF1 (NONE, OFF2)  
Servo: OFF1 (NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)**Acknowledge:** IMMEDIATELY**Cause:** The monitoring time for the sign-of-life counter has expired.

The connection between the drive and the higher-level control (SIMOTION, SINUMERIK) has been interrupted for the following reasons:

- the control was reset.
- the data transfer to the control was interrupted.

**Remedy:**  
- wait until the control has re-booted.  
- restore data transfer to the control.

**201930**      **<location>PB/PN: current controller sampling time clock cycle synch. not equal**

**Drive object:**    'All objects

**Message value:**    %1

**Reaction:**        NONE

**Acknowledge:**    NONE

**Cause:**            The current controller sampling time of all drives must be set the same for the clock cycle synchronous operation.  
Alarm value (r2124, interpret decimal):  
Number of the drive object with different current controller sampling time.

**Remedy:**            Set current controller sampling time to identical values (p0115[0]).  
Note:

| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                          |
| <b>Cause:</b>         | <p>The bus is in the data exchange state and clock synchronous operation has been selected using the parameterizing telegram. Synchronization with the master sign-of-life (STW2.12 ... STW2.15) could not be completed because the sign-of-life is changing differently to how it was configured in the Tmapc time grid.</p> |

**Remedy:**

- ensure that the master correctly increments the sign-of-life in the master application clock cycle Tmapc.
- correct the interconnection of the master sign-of-life (p2045).

**Note:**  
PB: PROFIBUS  
PN: PROFINET

**201945 <location>PROFIBUS: Connection to the Publisher failed**

**Drive object:** 'All objects  
**Message value:** Fault cause: %1 bin  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** For PROFIBUS peer-to-peer data transfer, the connection to at least one Publisher has failed.  
Alarm value (r2124, interpret binary):  
Bit 0 = 1: Publisher with address in r2077[0], connection failed.  
...  
Bit 15 = 1: Publisher with address in r2077[15], connection failed.

**Remedy:**

- check the PROFIBUS cables.
- carry out a first commissioning of the Publisher that has the failed connection.

---

**201946 <location>PROFIBUS: Connection to the Publisher aborted**

**Drive object:** 'All objects  
**Message value:** Fault cause: %1 bin  
**Reaction:** Infeed: OFF1 (NONE, OFF2)  
Servo: OFF1 (NONE, OFF2, OFF3)  
Hla: OFF1 (NONE, OFF2, OFF3)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** At this drive object, the connection to at least one Publisher for PROFIBUS peer-to-peer data transfer in cyclic operation has been aborted.  
Fault value (r0949, interpret binary):  
Bit 0 = 1: Publisher with address in r2077[0], connection aborted.  
...  
Bit 15 = 1: Publisher with address in r2077[15], connection aborted.

**Remedy:**

- check the PROFIBUS cables.
- check the state of the Publisher that has the aborted connection.

---

**201950 <location>PB/PN: clock cycle synchronous operation synchronization unsuccessful**

**Drive object:** 'All objects  
**Message value:** -  
**Reaction:** OFF1 (NONE)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** Synchronization of the internal clock cycle to the global control telegram has failed. The internal clock cycle exhibits an unexpected shift.

**Remedy:** Only for internal Siemens troubleshooting.

**Note:**  
PB: PROFIBUS  
PN: PROFINET

| <b>Reaction:</b>      | OFF2                                                                                                                                                                                                                                                                         |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                                                                                                       |
| <b>Cause:</b>         | Synchronization between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle was started and was not able to be successfully completed (e.g. after switch-on).<br>Fault value (r0949, interpret decimal):<br>Only for internal Siemens troubleshooting. |

- Remedy:**
1. Remove the cause of a possible DRIVE-CLiQ fault.
  2. Initiate a new synchronization, e.g. as follows:
    - remove the PROFIBUS master and re-insert again.
    - restart the PROFIBUS master.
    - switch off the Control Unit and switch on again.
    - carry out a Control Unit hardware reset (RESET button, p0972).
    - carry out a parameter reset and download the saved parameters (p0009 = 30, p0976 = 2, 3).

---

**201955 <location>CU DRIVE-CLiQ: Synchronization DO not completed**

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** After the drive system is switched on, the synchronization between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle was started but was not completed within the selected time tolerance.

Alarm value (r2124, interpret decimal):

Only for internal Siemens troubleshooting.

**Remedy:** Carry out a POWER ON (switch-off/switch-on) for all components of the DO.

---

**201970 <location>CBExx: cyclic connection interrupted**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The cyclic connection to the PROFINET controller is interrupted.

**Remedy:** Establish the PROFINET connection and activate the PROFINET controller in the cyclic mode.

---

**201971 <location>CBExx: maximum number of controllers exceeded**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** Info 1: %1, Info 2: %2

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A controller attempts to establish a connection to the drive, and as a consequence exceeds the permitted number of PROFINET connections.

The alarm is automatically withdrawn after approx. 30 seconds.

Alarm value (r2124, interpret hexadecimal):

yyyyxxxx hex: yyyy = info. 1, xxxx = info. 2

Info 1 = 0: number of RT connections exceeded

Info 1 > 0: number of IRT connections exceeded

Info 2: permitted number of connections

**Remedy:** Check the configuration of the PROFINET controllers.

---

**201977 <location>CBE41: overtemperature alarm**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The alarm threshold for the overtemperature of the Communication Board Ethernet 41 (CBE41) was reached.

**Remedy:**

- check the air intake for the Control Unit.
- check the Control Unit fan.

**Note:**

The alarm is automatically withdrawn once the limit value has been fallen below.

#### 201978 <location>CBE41: overtemperature fault

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:**

Infeed: OFF2 (OFF1)

Servo: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)

Hla: OFF3 (NONE, OFF1, OFF2, STOP2)

**Acknowledge:** POWER ON

**Cause:** The shutdown threshold for the overtemperature of the Communication Board Ethernet 41 (CBE41) was reached.

**Note:**

This fault results in the component being shut down.

As a consequence, communication via CBE41 is no longer possible.

**Remedy:**

- Switch-off the Control Unit and after a wait time, switch-on again.
- check the air intake for the Control Unit.
- check the Control Unit fan.
- Replace the component if the fault occurs again.

#### 201979 <location>CBExx: internal error for cyclic data transfer

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The cyclic actual values and/or setpoints were not transferred within the specified times.

Alarm value (r2124, interpret hexadecimal):

Only for internal Siemens troubleshooting.

**Remedy:** Correctly set T\_io\_input or T\_io\_output.

#### 201980 <location>PN: cyclic connection interrupted

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The cyclic connection to the PROFINET controller is interrupted.

**Remedy:** Establish the PROFINET connection and activate the PROFINET controller in the cyclic mode.

#### 201981 <location>PN: Maximum number of controllers exceeded

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** Info 1: %1, Info 2: %2

**Reaction:** NONE

**Acknowledge:** NONE

| <b>Reaction:</b>      | NONE                                                                                                                          |
| <b>Acknowledge:</b>   | NONE                                                                                                                          |
| <b>Cause:</b>         | The speed setpoint of a drive selected for connection is greater than the value for the standstill detection set using p1226. |

**Remedy:** For all of the drives specified for connection, set the speed setpoints to zero.

Note:

The alarm is reset as follows:

- remove the cause of this alarm.
- restart the function generator.

---

#### 202011 <location>Function generator: The actual drive speed is not zero

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, CU\_NX\_828, CU\_NX\_COMBI, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The speed actual value of a drive selected for connection is greater than the value for the standstill detection set using p1226.

**Remedy:** Set the relevant drives to zero speed before starting the function generator.

Note:

The alarm is reset as follows:

- remove the cause of this alarm.
- restart the function generator.

---

#### 202015 <location>Function generator: Drive enable signals missing

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The master control and/or enable signals are missing to connect to the specified drive.  
See also:p4815 (Function generator drive number)

**Remedy:** Fetch the master control to the specified drive object and set all enable signals.

Note:

The alarm is reset as follows:

- remove the cause of this alarm.
- restart the function generator.

---

#### 202016 <location>Function generator: Magnetizing running

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Magnetizing has not yet been completed on a drive object specified for connection.  
Alarm value (r2124, interpret decimal):  
Number of the drive object involved.  
See also:p4815 (Function generator drive number)

**Remedy:** Wait for magnetizing of the motor (r0056.4).

Note:

The alarm is reset as follows:

- restart the function generator.
- See also:r0056 (Status word, closed-loop control)

---

#### 202020 <location>Function generator: Parameter cannot be changed

**Drive object:** 'All objects

**Message value:** -

**202030 <location>Function generator: Physical address equals zero**

|                       |                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------|
| <b>Drive object:</b>  | 'All objects                                                                                    |
| <b>Message value:</b> | -                                                                                               |
| <b>Reaction:</b>      | NONE                                                                                            |
| <b>Acknowledge:</b>   | NONE                                                                                            |
| <b>Cause:</b>         | The specified physical address is zero.<br>See also:p4812 (Function generator physical address) |

**Remedy:** Set a physical address with a value other than zero.  
**Note:**  
 The alarm is reset as follows:  
 - remove the cause of this alarm.  
 - restart the function generator.  
 See also: p4812 (Function generator physical address)

---

#### 202040 <location>Function generator: Illegal value for offset

**Drive object:** 'All objects  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The value for the offset is higher than the value for the upper limit or lower than the value for the lower limit.  
 See also: p4826 (Function generator offset)  
**Remedy:** Adjust the offset value accordingly.  
**Note:**  
 The alarm is reset as follows:  
 - remove the cause of this alarm.  
 - restart the function generator.  
 See also: p4826 (Function generator offset), p4828 (Function generator lower limit), p4829 (Function generator upper limit)

---

#### 202041 <location>Function generator: Illegal value for bandwidth

**Drive object:** 'All objects  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The bandwidth referred to the time slice clock cycle of the function generator has either been set too low or too high.  
 Depending on the time slice clock cycle, the bandwidth is defined as follows:  
 $\text{Bandwidth\_max} = 1 / (2 \times \text{time slice clock cycle})$   
 $\text{Bandwidth\_min} = \text{Bandwidth\_max} / 100000$   
**Example:**  
 Assumption: p4830 = 125 µs  
 $\rightarrow \text{Bandwidth\_max} = 1 / (2 \times 125 \mu\text{s}) = 4000 \text{ Hz}$   
 $\rightarrow \text{Bandwidth\_min} = 4000 \text{ Hz} / 100000 = 0.04 \text{ Hz}$   
**Note:**  
 p4823: Function generator bandwidth  
 p4830: Function generator time slice clock cycle  
 See also: p4823 (Function generator bandwidth), p4830 (Function generator time slice cycle)  
**Remedy:** Check the value for the bandwidth and adapt accordingly.  
**Note:**  
 The alarm is reset as follows:  
 - remove the cause of this alarm.  
 - restart the function generator.

---

#### 202047 <location>Function generator: Time slice clock cycle invalid

**Drive object:** 'All objects  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE

**Cause:** The time slice clock cycle selected does not match any of the existing time slices.  
See also:p4830 (Function generator time slice cycle)

**Remedy:** Enter an existing time slice clock cycle. The existing time slices can be read out via p7901.

**Note:**  
The alarm is reset as follows:

- remove the cause of this alarm.
- restart the function generator.

See also:r7901 (Sampling times)

---

**202050 <location>Trace: Start not possible**

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The trace has already been started.  
See also:p4700 (Trace control)

**Remedy:** Stop the trace and, if necessary, start again.

---

**202051 <location>Trace: recording not possible as a result of know-how protection**

**Drive object:** 'All objects

**Message value:** initiating recorder: %1, parameter %2

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** TRACE recording is not possible as at least one signal or trigger signal being used is under know-how protection.  
Alarm value (r2124, interpret hexadecimal):  
bbbbaaaa hex:  
aaaa = 1: recorder 0  
aaaa = 2: recorder 1  
aaaa = 3: recorders 0 and 1  
bbbb = parameter number (hexadecimal), that was not able to be written to.  
See also:p4700, p4711, p4730, p4731, p4732, p4733, p4734, p4735, p4736, p4737

**Remedy:**

- Temporarily activate or deactivate know-how protection (p7766).
- include the signal in the OEM exception list (p7763, p7764).
- Where relevant do not record the signal.

See also:p7763 (KHP OEM exception list number of indices for p7764), p7764 (KHP OEM exception list)

---

**202055 <location>Trace: Recording time too short**

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The trace duration is too short.  
The minimum is twice the value of the trace clock cycle.  
See also:p4721 (Trace recording time)

**Remedy:** Check the selected recording time and, if necessary, adjust.

---

**202056 <location>Trace: Recording cycle too short**

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

---

|                     |                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Acknowledge:</b> | NONE                                                                                                                                |
| <b>Cause:</b>       | The selected recording cycle is shorter than the selected basic clock cycle 0 (p0110[0]).<br>See also:p4720 (Trace recording cycle) |
| <b>Remedy:</b>      | Increase the value for the trace cycle.                                                                                             |

---

#### 202057 <location>Trace: Time slice clock cycle invalid

|                       |                                                                                                                                  |

| <b>Cause:</b>         | - a signal to be traced was not specified.<br>- the specified signals are not valid.<br>See also:p4730 (Trace record signal 0), p4731 (Trace record signal 1), p4732 (Trace record signal 2), p4733 (Trace record signal 3) |
| <b>Remedy:</b>        | - specify the signal to be traced.<br>- check whether the relevant signal can be traced.                                                                                                                                    |

---

**202061 <location>Trace: Invalid signal**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_I\_828, CU\_I\_COMBI, CU\_LINK, CU\_NX\_828, CU\_NX\_COMBI, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** - the specified signal does not exist.  
- the specified signal can no longer be traced (recorded).  
See also: p4730 (Trace record signal 0), p4731 (Trace record signal 1), p4732 (Trace record signal 2), p4733 (Trace record signal 3)

**Remedy:** - specify the signal to be traced.  
- check whether the relevant signal can be traced.

---

**202062 <location>Trace: Invalid trigger signal**

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** - a trigger signal was not specified.  
- the specified signal does not exist.  
- the specified signal is not a fixed-point signal.  
- the specified signal cannot be used as a trigger signal for the trace.  
See also: p4711 (Trace trigger signal)

**Remedy:** Specify a valid trigger signal.

---

**202063 <location>Trace: Invalid data type**

**Drive object:** 'All objects

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The specified data type to select a signal using a physical address is invalid.  
See also: p4711 (Trace trigger signal), p4730 (Trace record signal 0), p4731 (Trace record signal 1), p4732 (Trace record signal 2), p4733 (Trace record signal 3)

**Remedy:** Use a valid data type.

---

**202070 <location>Trace: Parameter cannot be changed**

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The trace parameter settings cannot be changed when the trace is active.  
See also: p4700, p4710, p4711, p4712, p4713, p4714, p4715, p4716, p4720, p4721, p4722, p4730, p4731, p4732, p4733, p4780, p4781, p4782, p4783, p4789, p4795

**Remedy:** - stop the trace before parameterization.  
- if required, start the trace.

---

**202075 <location>Trace: Pretrigger time too long**

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE  
**Cause:** The selected pretrigger time must be shorter than the trace time.  
 See also: p4721 (Trace recording time), p4722 (Trace trigger delay)  
**Remedy:** Check the pretrigger time setting and change if necessary.

#### **202080 <location>Trace: Parameterization deleted due to unit changeover**

**Drive object:** 'All objects  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The trace parameterization in the drive unit was deleted due to a unit changeover or a change in the reference parameters.  
**Remedy:** Restart trace.

#### **202085 <location>Message function: Parameterization error**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI  
**Message value:** parameter: %1, index: %2  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** A parameterization error was identified when starting the variable message function.  
 Alarm value (r2124, interpret decimal):  
 yyxxxx dec: yy = index, xxxx = parameter  
 See also: p3290, p3291, p3292, p3293, r3294, p3295, p3296, p3297, p3298, p3299  
**Remedy:** Correct the parameter and restart.  
 Note:  
 The alarm is automatically withdrawn when stopping, or when successfully starting the variable message function.

#### **202095 <location>MTrace 0: multiple trace cannot be activated**

**Drive object:** 'All objects  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The following functions or settings are not permissible in conjunction with a multiple trace (trace recorder 0):  
 - measuring function  
 - long-time trace  
 - trigger condition "immediate recording start" (IMMEDIATE)  
 - trigger condition "start with function generator" (FG\_START)  
**Remedy:** - if required, deactivate the multiple trace (p4840[0] = 0).  
 - deactivate function or setting that is not permissible

#### **202096 <location>MTrace 0: cannot be saved**

**Drive object:** 'All objects  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>  | <p>It is not possible to save the measurement results of a multiple trace on the memory card (trace recorder 0).<br/>A multiple trace is not started or is canceled.<br/>Alarm value (r2124, interpret decimal):<br/>1: Memory card cannot be accessed.<br/>- card is not inserted or is blocked by a mounted USB drive.<br/>3: data save operation too slow.<br/>- a second trace has been completed before the measurement results of the first trace were able to be saved.<br/>- writing the measurement result files to the card is blocked by the parameter save.<br/>4: Data save operation canceled.<br/>- for instance, the file required for the data save operation was not able to be found.</p> |
| <b>Remedy:</b> | <p>- insert or remove the memory card.<br/>- use a larger memory card.<br/>- configure a longer trace time or use an endless trace.<br/>- avoid saving parameters while a multiple trace is running.<br/>- check whether other functions are presently accessing measurement result files.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Reaction:</b>      | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Cause:</b>         | <p>The system was not able to load a Technology Extension.</p> <p>Alarm value (r2124, interpret hexadecimal):</p> <p>10 hex (16 dec):</p> <p>The interface version in the DCB user library is not compatible to the DCC standard library that has been loaded.</p> <p>12 hex (18 dec):</p> <p>A technology package was not able to be downloaded to a Control Unit because the warm restart necessary was not able to be performed.</p> <p>Only for internal Siemens troubleshooting.</p>                            |

**Remedy:**

- carry out a warm restart (p0009 = 30, p0976 = 2, 3).
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade firmware to later version.
- contact Technical Support.

For alarm value = 10 hex (16 dec):  
Load a compatible DCB user library (compatible to the interface of the DCC standard library).  
For alarm value = 12 hex (18 dec):  
Carry out a POWER ON (switch-off/switch-on) for all components.

| <b>Reaction:</b>      | OFF1 (OFF2)                                                                                                                                                                                                                                                                            |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                                                                                                                 |
| <b>Cause:</b>         | When initializing the Terminal Modules, the terminals of the Control Unit or the Terminal Board 30, an internal software error has occurred.<br>Fault value (r0949, interpret decimal):<br>yxxx dex<br>y = Only for internal Siemens troubleshooting<br>xxx = component number (p0151) |

**Remedy:**

- switch-off/switch-on the power supply for the Control Unit.
- check the DRIVE-CLiQ connection.
- if required, replace the Terminal Module.

The Terminal Module should be directly connected to a DRIVE-CLiQ socket of the Control Unit.  
If the fault occurs again, replace the Terminal Module.

---

**203501 <location>TM: Sampling time change**

**Drive object:** 'All objects  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The sampling times of the inputs/outputs were changed.  
This change only becomes valid after the next boot.  
**Remedy:** Carry out a POWER ON.

---

**203505 <location>Analog input wire breakage**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** OFF1 (NONE, OFF2)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The wire-break monitoring for an analog input has responded.  
**Remedy:** Check the wiring for interruptions.

---

**203505 <location>Analog input wire breakage**

**Drive object:** CU\_LINK, CU\_NX\_828, CU\_NX\_COMBI, TM120, TM150, TM54F\_MA, TM54F\_SL  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The wire-break monitoring for an analog input has responded.  
The input value of the analog input has exceeded the threshold value parameterized in p4061[x].  
Index x = 0: Analog input 0 (X521.1/X521.2)  
Index x = 1: Analog input 1 (X521.3/X521.4)  
Fault value (r0949, interpret decimal):  
yxxx dec  
y = analog input (0 = analog input 0 (AI 0), 1 = analog input 1 (AI 1))  
xxx = component number (p0151)  
**Note:**  
For the following analog input type, the wire breakage monitoring is active:  
p4056[x] = 3 (unipolar current input monitored (+4 ... +20 mA))  
**Remedy:**  
- check the wiring for interruptions.  
- check the magnitude of the injected current - it is possible that the infed signal is too low.  
- check the load resistor (250 Ohm).  
**Note:**  
The input current measured by the Terminal Module can be read out from r4052[x].  
For p4056[x] = 3 (unipolar current input monitored (+4 ... +20 mA)) the following applies:  
A current less than 4 mA is not displayed in r4052[x] - but instead r4052[x] = 4 mA is output.

| <b>Message value:</b> | %1                                                                   |
| <b>Reaction:</b>      | NONE                                                                 |
| <b>Acknowledge:</b>   | NONE                                                                 |

- Cause:** Despite specification by the signal source the digital output has not been set.  
Possible causes:
- power supply missing.
  - the digital output is in current limiting (e.g. due to short-circuit).
  - the digital output is being used for Safety Extended Functions.
  - the control has authority to access the digital output by means of direct access (see also r0729).
- Alarm value (r2124, interpret bitwise binary):  
Digital output involved (structured the same as r0747).
- Remedy:**
- check the 24 V power supply (e.g. X130.6 for CU310-2, ground is X130.5).
  - check the output terminals for short-circuits.
  - reset the signal source of the digital output for use by Safety Extended Functions.
  - carry out a POWER ON (switch-off/switch-on).

**203510 <location>Calibration data not plausible**

**Drive object:** A\_INF\_828, B\_INF\_828, CU\_LINK, CU\_NX\_828, CU\_NX\_COMBI, HLA\_828, HUB, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI, TM54F\_MA, TM54F\_SL

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** During ramp-up, the Terminal Module 31 (TM31) calibration data is read in and checked for plausibility.  
At least one calibration data point was determined to be invalid.  
Alarm value (r2124, interpret binary):  
Bit 1: 10 V value, analog input 0 invalid.  
Bit 3: 10 V value, analog input 1 invalid.  
Bit 4: Offset, analog output 0 invalid.  
Bit 5: 10 V value, analog output 0 invalid.  
Bit 6: Offset, analog output 1 invalid.  
Bit 7: 10 V value, analog input 1 invalid.

**Remedy:**

- switch-off/switch-on the power supply for the Control Unit.
- check the DRIVE-CLiQ wiring.

Note:  
If it reoccurs, then replace the module.  
In principle, operation could continue.  
The analog channel involved possibly does not achieve the specified accuracy.

---

**203510 <location>CU: Calibration data not plausible**

**Drive object:** CU\_I\_828, CU\_I\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** During ramp-up, the Terminal Module 31 (TM31) calibration data is read in and checked for plausibility.  
At least one calibration data point was determined to be invalid.  
Alarm value (r2124, interpret binary):  
Bit 1: 10 V value, analog input 0 invalid.  
Bit 3: 10 V value, analog input 1 invalid.  
Bit 4: Offset, analog output 0 invalid.  
Bit 5: 10 V value, analog output 0 invalid.  
Bit 6: Offset, analog output 1 invalid.  
Bit 7: 10 V value, analog input 1 invalid.

**Remedy:**

- switch-off/switch-on the power supply for the Control Unit.
- check the DRIVE-CLiQ wiring.

**Note:**

If it reoccurs, then replace the module.

In principle, operation could continue.

The analog channel involved possibly does not achieve the specified accuracy.

---

#### 203510 <location>TM: Calibration data not plausible

**Drive object:** TM120, TM150

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:**

During ramp-up, the Terminal Module 31 (TM31) calibration data is read in and checked for plausibility.

At least one calibration data point was determined to be invalid.

Alarm value (r2124, interpret binary):

Bit 1: 10 V value, analog input 0 invalid.

Bit 3: 10 V value, analog input 1 invalid.

Bit 4: Offset, analog output 0 invalid.

Bit 5: 10 V value, analog output 0 invalid.

Bit 6: Offset, analog output 1 invalid.

Bit 7: 10 V value, analog input 1 invalid.

**Remedy:**

- switch-off/switch-on the power supply for the Control Unit.
- check the DRIVE-CLiQ wiring.

**Note:**

If it reoccurs, then replace the module.

In principle, operation could continue.

The analog channel involved possibly does not achieve the specified accuracy.

---

#### 203550 <location>TM: Speed setpoint filter natural frequency > Shannon frequency

**Drive object:** 'All objects

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:**

The natural filter frequency of the speed setpoint filter (p1417) is greater than or equal to the Shannon frequency.

The Shannon frequency is calculated according to the following formula:

$$0.5 / p4099[3]$$

See also: p1417

**Remedy:**

Reduce the natural frequency of the speed setpoint filter (PT2 low pass) (p1417).

---

#### 203590 <location>TM: Module not ready

**Drive object:** 'All objects

**Message value:** %1

**Reaction:**

Infeed: OFF2 (NONE)

Servo: NONE (IASC/DCBRK, OFF1, OFF2, OFF3, STOP2)

Hla: OFF2 (NONE)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:**

The Terminal Module involved does not send a ready signal and no valid cyclic data.

Fault value (r0949, interpret decimal):

Drive object number of the Terminal Module involved.

**Remedy:**

- check the 24 V power supply.
- check the DRIVE-CLiQ wiring.
- check whether the sampling time of the drive object involved is not equal to zero (p4099[0]).

---

**205000 <location>Power unit: Overtemperature heat sink AC inverter**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The alarm threshold for overtemperature at the inverter heat sink has been reached. The response is set using p0290. If the heat sink temperature exceeds the value set in p0292[0], then fault F30004 is output.

**Remedy:** Check the following:

- is the ambient temperature within the defined limit values?
- have the load conditions and the load duty cycle been appropriately dimensioned?
- has the cooling failed?

---

**205001 <location>Power unit: Overtemperature depletion layer chip**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Alarm threshold for overtemperature of the power semiconductor in the AC converter has been reached.

**Note:**

- the response is set using p0290.
- if the temperature of the barrier layer increases by the value set in p0292[1], then fault F30025 is initiated.

**Remedy:** Check the following:

- is the ambient temperature within the defined limit values?
- have the load conditions and the load duty cycle been appropriately dimensioned?
- has the cooling failed?
- pulse frequency too high?

**205002 <location>Power unit: Air intake overtemperature**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The alarm threshold for the air intake overtemperature has been reached. For air-cooled power units, the threshold is 42 °C (hysteresis 2 K). The response is set using p0290.

If the air intake temperature increases by an additional 13 K, then fault F30035 is output.

**Remedy:** Check the following:

- is the ambient temperature within the defined limit values?
- has the fan failed? Check the direction of rotation.

**205053 <location>Parallel circuit: Inadmissible DC link voltage asymmetry**

|                       |                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------|
| <b>Drive object:</b>  | A_INF_828, B_INF_828, S_INF_828                                                                      |
| <b>Message value:</b> | -                                                                                                    |
| <b>Reaction:</b>      | NONE                                                                                                 |
| <b>Acknowledge:</b>   | NONE                                                                                                 |
| <b>Cause:</b>         | The deviation of the DC link voltage measured values exceeds the alarm threshold specified in p7011. |

**Remedy:**

- inhibit the pulses of the faulted power unit (p7001).
- check the DC link connecting cables.
- the DC link voltage measurement is incorrect and must be calibrated or renewed.

#### 205054 <location>Parallel circuit: Power unit deactivated

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** For the drive object involved, fewer power units connected in parallel are active than exist in the target topology. Operation is only possible at reduced power (power derating).

**Remedy:** Re-activate the deactivated power units if required.

See also: p0125 (Activate/deactivate power unit components), p0895 (Activate/deactivate power unit components), p0897 (Parking axis selection)

---

#### 205055 <location>Parallel connection: Power units with illegal code numbers

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** Parameter: %1

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** The code numbers of the power units are not permissible.

For parallel circuit configurations, only power units with identical power unit data may be used.

Possible causes:

- the code numbers of the power units do not match.

For booksize drive units, the following additionally applies:

- a parallel connection is not possible for the power units being used.
- there are too many power units being used in the parallel connection.

Fault value (r0949, interpret decimal):

Parameter in which the inadmissible power unit code number was detected.

**Remedy:** - Use power units with the same code number.

For booksize drive units, the following additionally applies:

- use power units which are permitted for a parallel connection.
- reduce the number of power units being used in the parallel connection.

---

#### 205056 <location>Parallel circuit: Power unit EEPROM versions differ

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** Parameter: %1

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** The EEPROM versions of the power units do not match.

Fault value (r0949, interpret decimal):

Parameter in which the first different version number was detected.

**Remedy:** Use power units with the same EEPROM version.

Note:

For parallel circuit configurations, only power units with identical EEPROM versions may be used.

---

#### 205057 <location>Parallel circuit: Power unit firmware versions differ

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** Parameter: %1

**Reaction:** OFF2 (NONE)

| <b>205064</b>        | <b>&lt;location&gt;Parallel connection: Pulse synchronization error</b> |
| <b>Drive object:</b> | A_INF_828, S_INF_828                                                    |

**Message value:** -  
**Reaction:** Infeed: OFF2 (OFF1)  
**Acknowledge:** POWER ON (IMMEDIATELY)  
**Cause:** The pulse synchronization of at least one of the power units connected in parallel is incorrect.  
**Remedy:** Restart the drive system.

## 205066 <location>Parallel connection: inadmissible asymmetry VSM voltage

**Drive object:** A\_INF\_828, S\_INF\_828  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The deviation of the individual voltages of the Voltage Sensing Module (VSM) exceeds the alarm threshold set in p7324.  
 Alarm value (r2124, interpret decimal):  
 1: VSM voltage u1 - u2.  
 2: VSM voltage u2 - u3.  
**Remedy:**

- Check alarm threshold p7324, and if required, adapt.
- Check the connecting cables. Loose contacts can cause voltage spikes.
- Check the line connections, line circuit breaker and bypass contactors.
- Check filter reactors and filter capacitances. All parallel line filters must be of the same type, and must not have faulty reactors or capacitors.
- Deactivate the faulty Voltage Sensing Module (VSM) and faulty power unit (p7001), or if required, replace.

## 205118 <location>Precharging contactor simultaneity monitoring time exceeded

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** fault cause: %1, additional information: %2  
**Reaction:** OFF2 (NONE, OFF1)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** A feedback signal for the precharging contactor (ALM, SLM, BLM diode) or the line contactor (BLM thyristor) interconnected and the simultaneity monitoring (p0255[4, 6]) activated.  
 After opening or closing a contactor of the parallel connection, after a monitoring time has elapsed, not all of the contactors have assumed the same state.  
 Fault value (r0949, interpret binary):  
 yyyyxxxx hex: yyyy = supplementary information, xxxx = fault cause  
 Fault cause:  
 Bit 0 = 1: simultaneity error when closing the contactors.  
 Bit 1 = 1: simultaneity error when opening the contactors.  
 Supplementary information:  
 Bit 0 = 1: PDS0 contactor is closed.  
 Bit 1 = 1: PDS1 contactor is closed.  
 Bit 2 = 1: PDS2 contactor is closed.  
 Bit 3 = 1: PDS3 contactor is closed.  
 Bit 4 = 1: PDS4 contactor is closed.  
 Bit 5 = 1: PDS5 contactor is closed.  
 Bit 6 = 1: PDS6 contactor is closed.  
 Bit 7 = 1: PDS7 contactor is closed.  
 Note:  
 ALM: Active Line Module  
 BLM: Basic Line Module  
 PDS: Power unit Data Set  
 SLM: Smart Line Module

**Remedy:**

- check the monitoring time setting (p0255[4, 6]).
- check the wiring and control of the contactor.
- if required, replace the contactor.

---

**205119 <location>Bypass contactor simultaneity monitoring time exceeded**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** fault cause: %1, additional information: %2

**Reaction:** OFF2 (NONE, OFF1)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** A feedback signal for the bypass contactor is interconnected and the simultaneity monitoring (p0255[5, 7]) activated. After opening or closing a contactor of the parallel connection, after a monitoring time has elapsed, not all of the contactors have assumed the same state.

Fault value (r0949, interpret binary):

yyyyxxxx hex: yyyy = supplementary information, xxxx = fault cause

Fault cause:

Bit 0 = 1: simultaneity error when closing the contactors.

Bit 1 = 1: simultaneity error when opening the contactors.

Supplementary information:

Bit 0 = 1: PDS0 contactor is closed.

Bit 1 = 1: PDS1 contactor is closed.

Bit 2 = 1: PDS2 contactor is closed.

Bit 3 = 1: PDS3 contactor is closed.

Bit 4 = 1: PDS4 contactor is closed.

Bit 5 = 1: PDS5 contactor is closed.

Bit 6 = 1: PDS6 contactor is closed.

Bit 7 = 1: PDS7 contactor is closed.

Note:

PDS: Power unit Data Set

**Remedy:**

- check the monitoring time setting (p0255[5, 7]).
- check the wiring and control of the contactor.
- if required, replace the contactor.

| <b>Drive object:</b>  | A_INF_828, S_INF_828, S_INF_COMBI                                                                  |
| <b>Message value:</b> | -                                                                                                  |
| <b>Reaction:</b>      | OFF2                                                                                               |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                             |
| <b>Cause:</b>         | The power unit does not support the Smart Mode or pulse frequency wobulation is activated (p1810). |

**Remedy:**

- set the suitable sampling time  $250\ \mu\text{s} \leq p0115[0] \leq 400\ \mu\text{s}$  (e.g. by setting p0112 and p0115 to the factory setting).
- upgrade the power unit software and/or hardware for the Smart Mode. The availability of the Smart Mode function is displayed in r0192.
- when the software gating unit is activated ( $p1810.2 = 1$  or  $p1810.13 = 1$ ), then the Smart Mode is not permissible. Either the Smart Mode must be deactivated ( $p3400.0 = 0$ ) or the software gating unit must be deactivated.
- for A\_INF the following applies: deactivate the Smart Mode using  $p3400.0 = 0$ , and activate closed-loop voltage control with  $p3400.3 = 1$ . For booksize power units, it must be noted that for a supply voltage  $p0210 > 415\ \text{V}$  only the Smart Mode is possible in the presetting. If DC link voltages above 660 V are permissible in the application, then voltage-controlled operation can be activated with p0280, p0210, p3400 and p3510. The information regarding p0210 should be carefully noted.

**206052 <location>Infeed: Filter temperature evaluation not supported**

**Drive object:** A\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** -

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit does not support filter temperature evaluation.  
This feature (r0192.11) is required when an Active Interface Module is used as a line filter ( $p0220 = 41 \dots 45$ ).

**Remedy:** Upgrade the firmware for the power unit to a later version.  
See also: r0192 (Power unit firmware properties 1), p0220

---

**206080 <location>Infeed: parameter error**

**Drive object:** A\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** Parameter: %1

**Reaction:** OFF2 (NONE, OFF1)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** An infeed parameter is incorrectly set.  
Fault value (r0949, interpret decimal):  
Number of the parameter involved.  
See also: p0220, p3665, p3667, p3668

**Remedy:** Appropriately change the parameter specified in the fault value.  
See also: p0220, p3665, p3667, p3668

**206100 <location>Infeed: Shutdown due to line supply undervoltage condition**

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** %1

**Reaction:** OFF2 (OFF1)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The filtered (steady-state) value of the line supply voltage is less than the fault threshold (p0283).  
Fault condition:  $V_{\text{rms}} < p0283 * p0210$   
Fault value (r0949, floating point):  
Actual steady-state line supply voltage.  
Note:  
The occurrence of this fault is delayed by the time in p3492. If the fault is removed during this design time, then the power unit is not tripped (shut down).

See also: p0283 (Line supply undervoltage shutdown (trip) threshold), p3492 (Infeed, line supply undervoltage delay time)

**Remedy:**

- check the line supply.
- check the line supply voltage (p0210).
- check the threshold value (p0283).

---

**206105 <location>Infeed: Line supply undervoltage****Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI**Message value:** %1**Reaction:** NONE**Acknowledge:** NONE**Cause:** The filtered (steady-state) value of line supply voltage is lower than the alarm threshold (p0282).Alarm condition:  $V_{rms} < p0282 * p0210$ 

Alarm value (r2124, floating point):

Actual steady-state line supply voltage.

See also: p0282 (Line supply undervoltage alarm threshold)

**Remedy:**  
- check the line supply.  
- check the line supply voltage (p0210).  
- check the alarm threshold (p0282).

---

**206200 <location>Infeed: One or several line phases failed****Drive object:** A\_INF\_828, S\_INF\_828, S\_INF\_COMBI**Message value:** -**Reaction:** OFF2 (OFF1)**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** Failure overvoltage in one or several line supply phases.

The fault can be output in two operating states:

1. During the switch-on phase of the infeed unit.

The measured line supply angle deviates from the regular characteristic for a 3-phase system - the PLL cannot be synchronized.

The fault occurs immediately after switch-on if, when operating with a Voltage Sensing Module (VSM), the phase assignment L1, L2, L3 at the VSM differs from the phase assignment at the power unit.

2. While the infeed is operational.

During an active line voltage alarm (A06205) or current symmetry alarm (A06206), an additional fault occurred, which resulted in a shutdown. Alarm values A06205 and A06206 could provide additional information about the cause of the shutdown.

Possible causes:

- voltage dip on the line side or phase failure or overvoltage lasting longer than 10 ms.
- overload condition on the load side with peak current.
- line reactor missing.

**Remedy:**  
- check the line supply, terminals and fuses.  
- check the connection and size (rating) of the line filter and/or the line commutating reactor.  
- check and correct the phase assignment at the VSM (X521 or X522) and at the power unit.  
- check the load.  
- if failed in operation, carefully note the previous alarm messages A06205/A06206 with alarm values.

| <b>Cause:</b>       | <p>The asymmetry of the three line currents at the terminals of the power unit exceeds the set alarm threshold (p3465). Generally, the cause of current asymmetry is line voltage asymmetry or failure of a line phase (e.g. a fuse has ruptured or a terminal connection has become loose). As a consequence, the message is also signaled as possible phase failure in status parameter r3405.2.</p> <p>Cyclic power fluctuations in the DC link with the line frequency can also result in unequal rms values of the line currents. For this type of operating scenario, it is recommended that monitoring is deactivated (p3465[0, 3] = 0).</p> <p>Alarm value (r2134, floating point):</p> <p>Digits to the left of the decimal point:</p> <p>Highest rms phase current in amps.</p> <p>Decimal places:</p> <p>Quotient of the lowest and highest rms phase current value.</p> |
| <b>Remedy:</b>      | <ul style="list-style-type: none"> <li>- check the line supply, terminals and fuses.</li> <li>- check the line supply quality and system fault level.</li> <li>- check the load.</li> <li>- check the settings in p3462 and p3465.</li> </ul> <p>See also: r3405, p3465 (Infeed current symmetry monitoring thresholds)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**206260 <location>Infeed: Temperature in the line filter too high****Drive object:** A\_INF\_828, S\_INF\_828, S\_INF\_COMBI**Message value:** -**Reaction:** NONE**Acknowledge:** NONE

**Cause:** The temperature monitoring in the line filter has responded.  
If the temperature remains too high during the complete monitoring time, this results in fault F06261.  
**Note:**

The temperature monitoring is only available for an Active Interface Module.

**Remedy:**

- check whether the line filter type set in p0220[0] matches the line filter that is actually connected. Ensure that the line filter specified for the infeed being used is connected or correct the setting of the line filter type in p0220[0].
- temperature monitoring is mandatory for AIM line filters (refer to p0220). Ensure that the line filter temperature switch is correctly and reliably connected to input X21 of the infeed.
- reduce the ambient temperature of the line filter.
- reduce the load on the infeed and the filter module.
- check the magnitude of the line supply voltage.
- the internal fan of the filter module is defective. Replace the fan if necessary.
- defective temperature switch of the filter module. Replace the filter module if necessary.

---

**206261 <location>Infeed: Temperature in the line filter permanently too high****Drive object:** A\_INF\_828, S\_INF\_828, S\_INF\_COMBI**Message value:** -**Reaction:** OFF2 (OFF1)**Acknowledge:** IMMEDIATELY

**Cause:** After the temperature monitoring responded, the temperature in the line filter was permanently exceeded.  
**Note:**

The temperature monitoring is only available for an Active Interface Module (AIM).

**Remedy:**

- check whether the line filter type set in p0220[0] matches the line filter that is actually connected. Ensure that the line filter specified for the infeed being used is connected or correct the setting of the line filter type in p0220[0].
- temperature monitoring is mandatory for AIM line filters (refer to p0220). Ensure that the temperature switch in the line filter is correctly and reliably connected to input X21 of the infeed.
- reduce the ambient temperature of the line filter.
- reduce the load on the infeed and the line filter.
- check the magnitude of the line supply voltage.
- the internal fan of the line filter is defective. Replace the fan if necessary.
- defective temperature switch of the line filter. Replace the line filter if necessary.

---

**206262 <location>Infeed: Temperature switch in the line filter open when switching on****Drive object:** A\_INF\_828, S\_INF\_828, S\_INF\_COMBI**Message value:** -**Reaction:** OFF2 (OFF1)**Acknowledge:** IMMEDIATELY

**Cause:** When switching on the infeed, the temperature in the line filter is too high. Switching on is prevented.

**Remedy:**

- check whether the line filter type set in p0220[0] matches the line filter that is actually connected. Ensure that the line filter specified for the infeed being used is connected or correct the setting of the line filter type in p0220[0].
- temperature monitoring is mandatory for AIM line filters (refer to p0220). Ensure that the temperature switch in the line filter is correctly and reliably connected to input X21 of the infeed.
- the filter temperature is too high. Allow the system to cool down.
- the internal fan of the line filter is defective. Replace the fan if necessary.
- defective temperature switch of the line filter. Replace the line filter if necessary.

| <b>Cause:</b>         | The actual line frequency $f_{line}$ is lower than the parameterized alarm threshold ( $f_{line} < p0211 * p0285$ ).<br>The alarm can be output in two operating states:<br>1. During the switch-on phase of the infeed unit.<br>Consequence:<br>Synchronization of the infeed to the line supply is interrupted and is restarted.<br>The alarm is reissued if the line frequency remains less than the parameterized alarm threshold.<br>2. While the infeed is operational.<br>Consequence:<br>The infeed remains in the "operating" (run) state and alarm A06351 is output. This signifies a critical operational fault.<br>Alarm value (r2124, floating point):<br>Actual line frequency determined.<br>See also:p0285 (Line supply frequency undershot alarm threshold) |

**Remedy:**

- check the parameterized line frequency and if required change (p0211).
- check the alarm threshold (p0285).
- check the line supply.
- check the line supply quality.

**206400 <location>Infeed: Line supply data identification selected/active**

**Drive object:** A\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The line supply data identification is selected and active.  
The line inductance and the DC link capacitance are measured at the next pulse enable.  
See also: p3410 (Infeed identification method)

**Remedy:** Not necessary.  
This alarm is automatically withdrawn after the measurement has been completed.

**206401 <location>Infeed: Transformer data identification/test mode selected/active**

**Drive object:** A\_INF\_828

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A transformer data identification type or a transformer test operation has been selected or is active.  
Alarm value (r2124, interpret decimal):  
11: Identification type 1 selected for transformer data (automatic determination of the magnetizing inductance).  
12: Identification type 2 selected for transformer data (automatic determination of transformer phase shift and gain correction).  
13: Identification type 3 selected for transformer data (determination of total leakage inductance of transformer during line data identification).  
101: Test mode 1 selected.  
102: Test mode 2 selected.  
See also: p5480 (Transformer magnetization mode)

**Remedy:** Not necessary.  
This alarm is automatically withdrawn after the identification has expired.

---

**206500 <location>Infeed: Line synchronization not possible**

**Drive object:** A\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** -

**Reaction:** OFF2 (OFF1)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The line synchronization is not possible within the monitoring time.  
The infeed was re-synchronized to the line supply because it was interrupted due to an incorrect line frequency or due to excessively high line voltage distortion.  
After 20 attempts, synchronization - and therefore also the switching-on operation - were interrupted.  
Especially for ALM chassis units, one possible cause is that the bypass contactor or circuit breaker does not close.

**Remedy:**

- check the parameterized line frequency and if required change (p0211).
- check the setting of the threshold values (p0284, p0285).
- check the line supply.
- check the connecting terminals
- check the bypass contactor (if one is being used) and its associated control.
- check the state of the circuit breaker and its associated control.
- for significant line voltage distortion, after assessment by experts, the tolerance threshold p3457[2] can be adapted.

When using a Voltage Sensing Module (VSM):

- check the line supply connection at the terminals (X521, X522).
- check VSM activation (p0145, p3400).
- check the line supply quality.

**Note:**

In the case of chassis power units, the availability of correct VSM voltage measured values is imperative for line synchronization.

---

#### **206502 <location>Infeed: Unable to achieve line synchronization in transformer magnetization**

**Drive object:** A\_INF\_828

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Line synchronization is not possible within the monitoring time (p5481[2]).

**Remedy:**

- check the setting of the threshold value (p5485).
- check the setting of the maximum time (p5481[2])
- check the line supply quality.

See also: p5481 (Transformer magnetization times), p5485 (Transformer magnetization voltage thresholds)

---

#### **206503 <location>Infeed: Line black start unsuccessful**

**Drive object:** A\_INF\_828

**Message value:** %1

**Reaction:** OFF1 (NONE, OFF2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:**

The line black start was unsuccessful.

Fault value (r0949, interpret decimal):

State of the black start (corresponds to r5482).

The following applies for fault value r0949 = 109:

At the start of a black start (p5581 = 1), a line supply was identified (frequency and voltage within the specified limits p0281 to p0285).

The following applies to all other fault values:

The maximum time for a black start (p5581[2]) was exceeded.

**Remedy:**

- check the conditions of a line black start.
- check the parameterization of the line black start.

See also: p5581 (Island grid times)

---

#### **206504 <location>Infeed: Island line supply synchronization unsuccessful**

**Drive object:** A\_INF\_828

**Message value:** %1

**Reaction:** NONE (OFF1, OFF2)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The island line supply synchronization was unsuccessful.  
 Alarm value (r2124, interpret decimal):  
 State, in which the island line supply synchronization has remained (corresponds to r5482).  
 See also:r5482 (Line synchronization status)

**Remedy:** - check the conditions for the island line supply synchronization.  
 - check the parameterization of the island line supply synchronization.  
 See also:p5581 (Island grid times)

---

**206505 <location>Infeed: For transformer magnetization current limit exceeded**

**Drive object:** A\_INF\_828  
**Message value:** %1  
**Reaction:** OFF1 (OFF2)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The current limit was exceeded when magnetizing the transformer ( $r0068 > p5494[1] * r0207$ ).  
**Remedy:** - check the setting of the current limit ( $p5494[1]$ )  
 - check the primary side of the transformer for a short-circuit.  
 - check the control and feedback signal of the circuit breaker.  
 See also:p5494 (Transformer magnetization scaling values)

---

**206601 <location>Infeed: Current offset measurement interrupted**

**Drive object:** A\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** Defective current measurement or a DC current is present during the offset measurement.  
 Alarm value (r2124, interpret decimal):  
 1: Excessively high phase current has occurred during the current offset calibration.  
 2: The measured current offset is greater than the 3% of the maximum permissible converter current (e.g. due to a ground fault in the DC link).  
**Remedy:** For alarm value = 1:  
 - possible counter-measure if there is no line contactor: Power up an adequately long time before OFF1 = 1.  
 For alarm value = 2:  
 - defective current measurement or a DC current is present during the offset measurement.  
 - check the DC link for a ground fault.

---

**206602 <location>Infeed: Current offset measurement not possible**

**Drive object:** A\_INF\_828, S\_INF\_828, S\_INF\_COMBI  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** After an OFF1 = 1 no valid current offset measurement was able to be made within the monitoring time (p3491) before closing the line contactor. The current offset is set to 0.  
 See also:p3491 (Infeed I-offset measurement monitoring time)  
**Remedy:** - check the DC link for a ground fault. A ground fault can destroy parts and components!  
 - check the monitoring time setting and if required increase (p3491). At least 100 ms is required for a valid measurement ( $p3491 > 100 \text{ ms}$ ).  
 Notice:  
 If there is no valid measurement, then under certain circumstances the quality of the DC link control will be reduced.  
 See also:p3491 (Infeed I-offset measurement monitoring time)

| <b>Reaction:</b>      | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Acknowledge:** NONE

**Cause:** The current hysteresis controller sequence control has detected a short circuit (r5452, r5522). The absolute line supply voltage (r5444[0], r5512[0]) is below the short-circuit voltage limit (p5459[2], p5529[2]), and the current limitation is active (r5402.3 = 1, r5502.3 = 1).

**Note:**

The effective current limit is obtained from the parameterized overcurrent (p5453) and the hysteresis width (p5454).

**Remedy:**

- check the parameterization of the current hysteresis controller (p5453).
- check the line supply cables for a short-circuit.

---

**206850 <location>Infeed: Short-circuit prevailing for too long**

**Drive object:** A\_INF\_828

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The maximum permissible duration (p5458[1], p5528[1]) for the short-circuit has been exceeded. The short-circuit could not be cleared within this time.

**Remedy:**

- check the minimum time parameter setting (p5458[1], p5528[1]).
- check the line supply and fuses.

---

**206851 <location>Infeed: Distributed infeed line monitoring tripped**

**Drive object:** A\_INF\_828

**Message value:** %1

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY (POWER ON)

**Cause:** The line monitoring of the distributed line infeed has tripped.

Alarm value (r2124, interpret hexadecimal):

Corresponds to status word (r5542).

**Remedy:**

- check the line supply.
- check the parameterization of the line monitoring (p5540 ... p5559).

---

**206855 <location>Infeed: Line filter monitor responded**

**Drive object:** A\_INF\_828

**Message value:** %1

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** A threshold value parameterized in p3678 has been exceeded or undershot in the line filter.

Fault value (r0949, interpret decimal):

0: Voltage threshold, alpha/beta voltage monitoring fallen below (p3678[0]).

2: Voltage threshold value of the phase voltage monitoring fallen below (p3678[0]).

x1:

Current threshold value exceeded (p3678[1]).

The 10th position codes the power unit number of the Active Interface Module involved.

Example:

01: overcurrent in line filter 1.

11: Overcurrent in line filter 2.

See also: p3678 (Filter monitoring threshold values), p3679 (Transformer filter monitoring times)

- Remedy:**
- check the parameterization of the threshold values for filter monitoring (p3678)).
  - check filter.
- For fault value = 0:
- check the parameterization of the voltage monitoring smoothing time (p3679[0]).
- For fault value = 1:
- check the parameterization of the current monitoring minimum time (p3679[1]).

---

## 206860 <location>Infeed: Function module activation not possible

**Drive object:** A\_INF\_828

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Function module activation is not possible.

The power unit used has at least one of the following features:

- gating unit with current limiting control (r0192.19).
- gating unit with all-phase current limiting (r0192.30).

The affected function module is identified in fault value r0949 (the value of r0949 corresponds to the bit of parameter p0108).

r0949 = 7 "Dynamic grid support" function module

r0949 = 12: "Line droop control" function module

See also: r0192 (Power unit firmware properties 1)

- Remedy:**
- check whether the power unit used has the "gating unit with current limiting control" feature (r0192.19) or "gating unit with all-phase current limiting" feature (r0192.30).
  - if necessary, use a power unit that has at least one of these features.

---

## 206900 <location>Braking Module: Fault (1 -> 0)

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The Braking Module signals a fault (1 -> 0) via X21.4 ("booksize" format) or X21.5 ("chassis" format).

This signal is wired to a system digital input and correspondingly interconnected using binector input p3866[0...7].

Possible causes:

- wiring of the signal or BICO interconnection of the signal source incorrect.
- overtemperature
- electronics power supply missing.
- ground fault/short-circuit.
- internal component fault.

See also: p3866 (Braking Module fault)

- Remedy:**
- check binector input p3866[0...7] and the wiring from terminal X21.4 ("booksize" format) or X21.5 ("chassis" format).
  - reduce the number of braking operations.
  - check the 24 V power supply of the component.
  - check for a ground fault or short circuit.
  - replace the component if necessary.

---

## 206901 <location>Braking Module: Pre-alarm I2t shutdown

**Drive object:** A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The Braking Module "Booksize" format signals "Pre-alarm I2t shutdown" via terminal X21.3.  
This signal is wired to a system digital input and correspondingly interconnected using binector input p3865[0...7].  
**Note:**  
This function is not supported for the "chassis" format.

**Remedy:** - reduce the number of braking operations.  
- check binector input p3865[0...7] and the wiring from terminal X21.3 of the particular Braking Module.

---

**206904 <location>Braking Module internal is inhibited**

**Drive object:** B\_INF\_828  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The internal Braking Module was inhibited via binector input p3680 = 1 signal.  
In the inhibited state, energy cannot be dissipated using the braking resistor.  
See also: p3680 (Braking Module internal inhibit)

**Remedy:** Release the internal Braking Module (BI: p3680 = 0 signal).

---

**206905 <location>Braking Module internal I2t shutdown alarm**

**Drive object:** B\_INF\_828  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The internal Braking Module outputs an alarm due to the high I2t value.  
80% of the maximum switch-on duration of the braking resistor has been reached.  
**Note:**  
This message is also displayed via BO: p3685.  
See also: r3685 (Digital Braking Module: Pre-alarm I2t shutdown)

**Remedy:** Reduce the number of braking operations.

---

**206906 <location>Braking Module internal fault**

**Drive object:** B\_INF\_828  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** IMMEDIATELY  
**Cause:** The internal Braking Module outputs a fault due to overcurrent or an excessively high I2t value and is therefore inhibited.  
**Note:**  
This message is also displayed via BO: p3686.  
Fault value (r0949, interpret bitwise binary):  
Bit 0 = 1: I2t exceeded  
Bit 1 = 1: overcurrent  
See also: r3686 (Digital Braking Module fault)

**Remedy:** Reduce the number of braking operations.

---

**206907 <location>Braking Module internal overtemperature**

**Drive object:** B\_INF\_828  
**Message value:** -  
**Reaction:** OFF2 (NONE, OFF1)  
**Acknowledge:** IMMEDIATELY

|                |                                                                                                                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>  | The temperature sensor connected to the braking resistor signals an overtemperature.<br>The Braking Module is still active. If the overtemperature persists for more than 60 s, fault F06908 is output, and the braking module is switched off.<br>See also:r3687 (Digital Braking Module pre-alarm overtemperature) |
| <b>Remedy:</b> | - reduce the temperature at the sensor.<br>- check the temperature sensor connection.                                                                                                                                                                                                                                |

| <b>Reaction:</b>      | NONE                                                                                                                                                                                                                                                                                                                                                                |
| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                |
| <b>Cause:</b>         | <p>The motor temperature model 1/3 identified that the alarm threshold was exceeded.</p> <p>Hysteresis:2K</p> <p>Alarm value (r2124, interpret decimal):</p> <p>200:</p> <p>Motor temperature model 1 (I2t): temperature too high.</p> <p>300:</p> <p>Motor temperature model 3: temperature too high.</p> <p>See also:r0034, p0351, p0605, p0611, p0612, p0613</p> |

**Remedy:**

- check the motor load and if required, reduce.
- check the motor ambient temperature.
- check activation of the motor temperature model (p0612).

Motor temperature model 1 (I2t):

- check the thermal time constant (p0611).
- check alarm threshold.

Motor temperature model 3:

- check the motor type.
- check alarm threshold.
- check the model parameters.

### 207013 <location>Drive: Motor temperature model configuration fault

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2 (NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** A fault has occurred in the configuration of the motor temperature model.

Fault value (r0949, interpret decimal):

300:

Motor temperature model 3: The sensor does not supply the necessary sensor temperature for the thermal model.

301:

Motor temperature model 3: The sensor type is unknown.

302:

Motor temperature model 3: At least one other temperature model was simultaneously activated.

303:

Motor temperature model unknown in the actual firmware version.

See also: p0300, p0301, p0404, p0612

**Remedy:**

- check the encoder type.
- check the motor type.
- check activation of the motor temperature model (p0612).
- check the parameters of the motor temperature model (p5350 and following).

---

### 207014 <location>Drive: Motor temperature model configuration alarm

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A fault has occurred in the configuration of the motor temperature model.

Alarm value (r2124, interpret decimal):

1:

All motor temperature models: It is not possible to save the model temperature

300:

Motor temperature model 3: Threshold value for alarm (r5398) is higher than the threshold value for fault (r5399).

See also: p0610 (Motor overtemperature response), p5390 (Mot\_temp\_mod 1/3 alarm threshold), p5391 (Mot\_temp\_mod 1/3 fault threshold)

**Remedy:**

- set the response for motor overtemperature to "Alarm and fault, no reduction of I<sub>max</sub>" (p0610 = 2).
- check and correct the threshold values (r5398, r5399).

See also: p0610 (Motor overtemperature response), p5390 (Mot\_temp\_mod 1/3 alarm threshold), p5391 (Mot\_temp\_mod 1/3 fault threshold)

---

**207015 <location>Drive: Motor temperature sensor alarm**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** An error was detected when evaluating the temperature sensor set in p0600 and p0601.  
With the fault, the time in p0607 is started. If the fault is still present after this time has expired, then fault F07016 is output; however, at the earliest, 50 ms after alarm A07015.  
Possible causes:

- wire breakage or sensor not connected (KTY: R > 1630 Ohm, PT1000: R > 1720 Ohm).
- measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm).

Alarm value (r2124, interpret decimal):

- if SME/TM120 is selected (p0601 = 10, 11),  
this is the number of the temperature channel leading to the message.

**Remedy:**

- make sure that the sensor is connected correctly.
- check the parameterization (p0600, p0601).
- check the setting of the lower threshold (p4622).

See also: r0035, p0600, p0601, p0607, p4622

---

**207016 <location>Drive: Motor temperature sensor fault**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF1 (NONE, OFF2, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY

**Cause:** An error was detected when evaluating the temperature sensor set in p0600 and p0601.

Possible causes:

- wire breakage or sensor not connected (KTY: R > 1630 Ohm, PT1000: R > 1720 Ohm).
- measured resistance too low (PTC: R < 20 Ohm, KTY: R < 50 Ohm, PT1000: R < 603 Ohm).

Note:

If alarm A07015 is present, the time in p0607 is started. If the fault is still present after this time has expired, then fault F07016 is output; however, at the earliest, 50 ms after alarm A07015.

Fault value (r0949, interpret decimal):

- if SME/TM120 is selected (p0601 = 10, 11),  
this is the number of the temperature channel leading to the message.

See also: p0607 (Temperature sensor fault timer)

**Remedy:**

- make sure that the sensor is connected correctly.
- check the parameterization (p0600, p0601).
- induction motors: Deactivate temperature sensor fault (p0607 = 0).
- When TM120 and SMC/SME (p0601 = 10, 11) are being used, set the same sensor type on the drive (p4610 ... p4613) as for TM120.
- check the setting of the lower threshold (p4622).

| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Cause:</b>         | Open-loop/closed-loop control parameters have had to be changed.<br>Possible causes:<br>1. As a result of other parameters, they have exceeded the dynamic limits.<br>2. They cannot be used due to the fact that the hardware detected not having certain features.<br>3. The value is estimated as the thermal time constant is missing.<br>4. Motor temperature model 1 is activated as thermal motor protection is missing.<br>Fault value (r0949, interpret decimal):<br>Changed parameter number.<br>340:<br>The motor and control parameters were automatically calculated (p0340 = 1), because the vector control was subsequently activated as configuration (r0108.2).<br>611:<br>The time constant for thermal motor model 1 was estimated.<br>612:<br>Thermal motor model 1 was activated (p0612.0 = 1).<br>1800:<br>A more favorable pulse frequency was preassigned.<br>See also: p0640, p1082, p1300, p1800 |
| <b>Remedy:</b>        | Not necessary.<br>It is not necessary to change the parameters as they have already been correctly limited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Cause:</b>         | The upper torque limit is lower than the lower torque limit.                      |
| <b>Remedy:</b>        | P1 must be >= P2 if parameter P1 is connected to p1522 and parameter P2 to p1523. |

| <b>Cause:</b>         | <p>An error was identified when executing the "Test signal" function (<math>p5307.1 = 1</math>).</p> <p>The function was not executed or was canceled.</p> <p>Fault value (r0949, interpret decimal):</p> <ol style="list-style-type: none"> <li>1: No distance limit has been defined (<math>p5308 = 0</math>).</li> <li>2: The moment of inertia estimator has not stabilized in the parameterized time (<math>p5309</math>) (<math>r1407.26</math>).</li> <li>3: The parameterized distance (<math>p5308</math>) was exceeded.</li> <li>4: no motor encoder parameterized (closed-loop speed control without encoder).</li> <li>5: Offset (<math>p5297</math>) is too high for the parameterized distance (<math>p5308</math>).</li> <li>6: Pulse enable was withdrawn while traversing.</li> <li>7: speed setpoint not equal to zero.</li> </ol> <p>See also: <math>p5307</math> (Activate One Button Tuning test signal), <math>p5308</math> (One Button Tuning test signal distance limiting), <math>p5309</math> (One Button Tuning test signal duration)</p> |

**Remedy:**

- For fault value = 1:
  - Define distance limiting (p5308).
- For fault value = 2:
  - increase the duration or distance limiting (p5309, p5308).
- For fault value = 3:
  - check distance limiting (p5308).
- For fault value = 4:
  - configure speed control with encoder.
- For fault value = 5:
  - increase distance limit p5308 or reduce offset p5297.
  - the fault can only be acknowledged after p5300 was set = 0.
  - for the factory setting, a test signal duration of approximately 1.3 s is obtained. If an offset (p5297) of 60 rpm is set, for example, then this results in a distance of approximately 1.3 revolutions. As a consequence, a value must be parameterized in parameter p5308, which is longer than this distance + 10% controller reserve (e.g. p5308=515°). Further, the distance depends on the speed controller sampling time (p0115[1]) and the controller configuration (p5271).
- For fault value = 6:
  - keep the drive switched on until the "Test signal" function has been completely exited.
- For fault value = 7:
  - set the speed setpoint to zero. It is possible that the setpoint was entered from the control panel.

---

**207094 <location>General parameter limit violation**

**Drive object:** 'All objects  
**Message value:** Parameter: %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** As a result of the violation of a parameter limit, the parameter value was automatically corrected.  
Minimum limit violated --> parameter is set to the minimum value.  
Maximum limit violated --> parameter is set to the maximum value.  
Alarm value (r2124, interpret decimal):  
Parameter number, whose value had to be adapted.  
**Remedy:** Check the adapted parameter values and if required correct.

---

**207095 <location>Drive: One Button Tuning activated**

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The One Button Tuning function is active.  
One Button Tuning is performed at the next switch-on command.  
See also: p5300 (Autotuning selection)  
**Remedy:** Not necessary.  
The alarm is automatically withdrawn after One Button Tuning has been exited (p5300 = 0).

**207329 <location>Drive: kT estimator, kT(iq) characteristic or voltage compensation does not function**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** A function of the function module "extended torque control" (r0108.1) was activated - however the (complete) function is not available.

Alarm value (r2124, interpret decimal):

1 ... 3: The kT estimator is active (p1780.3 = 1) without a functioning compensation of the voltage emulation error in the drive converter. This means that the accuracy is severely restricted.

1: The drive converter voltage emulation error "final value" is 0 (p1952).

2: The drive converter voltage emulation error "current offset" is 0 (p1953).

3: The compensation of the voltage emulation error is disabled (p1780.8 = 0).

4: The kT estimator (p1780.3 = 1), the kT(iq) characteristic (p1780.9 = 1) or the compensation of the voltage emulation error (p1780.8 = 1) was activated without activating the function module "extended torque control" (when the function module is activated, the following must apply: r0108.1 = 1).

5: the kT(iq) characteristic has been activated (p1780.9 = 1). However, the kT characteristic value kT1 is 0 (p0645). The function is not active.

**Remedy:** For alarm value = 1, 2:

- carry out an identification of the voltage emulation error in the drive converter (p1909.14 = 1, p1910 = 1).
- set the parameter to compensate the voltage emulation error in the drive converter (p1952, p1953).

For alarm value = 3:

- enable the compensation of the voltage emulation error in the drive converter (p1780.8 = 1).

For alarm value = 4:

- activate the function module "extended torque control" (r0108.1 = 1) or deactivate the corresponding functions (p1780.3 = 0, p1780.8 = 0, p1780.9 = 0).

For alarm value = 5:

- determine the parameters of the kT characteristic (p0645 ... p0648) using the rotating measurement (p1959.6, p1960).
- enter the parameters of the kT characteristic (p0645 ... p0648) (if known).
- if necessary, deactivate the kT characteristic (p1780.9 = 0).

---

**207334 <location>Function not possible**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** For this configuration, the selected function is not possible.

Fault value (r0949, interpret decimal):

0:

Function "Travel to fixed end stop" (p1545) was selected, although encoderless operation or U/f operation is active.

**Remedy:** For fault value = 0:

- Operate the closed-loop speed control with an encoder.
- If necessary, deselect function "Travel to fixed stop".

| <b>Reaction:</b>      | OFF1 (NONE, OFF2)                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Cause:</b>         | <p>A cogging torque compensation error has occurred while learning.</p> <p>Fault value (r0949, interpret decimal):</p> <p>1:</p> <p>The learning velocity is too high.</p> <ul style="list-style-type: none"><li>- rotating: absolute value greater than 5 [rpm]</li><li>- linear: absolute value greater than 0.5 [m/min]</li></ul> <p>2:</p> <p>The commutation angle offset (p0431) is incorporated in the position and was changed.</p> |

**Remedy:** For fault value = 1:  
Repeat learning with the lower velocity setpoint.  
Recommended speeds:  
- rotating 2 [rpm]  
- linear 0.1 [m/min]  
For fault value = 2:  
New learning required, which must be saved.  
See also: p5250 (Compensation configuration), p5251 (Activate learn cogging torque compensation)

---

**207356**      **<location>Drive: Cogging torque compensation motor or encoder serial number different**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1, drive data set: %2

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** Cogging torque compensation is activated via external table (p5260, p5261) (p5250.0 = 1), not active or incorrectly parameterized.  
Alarm value (r2124, interpret hexadecimal):  
yyyyxx hex: yyyy = fault cause, xx = drive data set  
yyyy = 1:  
Motor or encoder were replaced, or external table was not learned.  
yyyy = 2:  
Cogging torque compensation via external table was activated for more than one motor data set, and the serial numbers do not match. There is only one external table.  
yyyy = 3:  
Cogging torque compensation via external table was activated for more than one motor data set, and p0826 indicates that different motors are involved. There is only one external table.  
yyyy = 4:  
Cogging torque compensation via external table was activated for data sets with different encoder data sets (EDS). Cogging torque compensation with external table only supports one encoder.

**Remedy:** For fault cause = 1:  
Relearn cogging torque table (p5251).  
For fault cause = 2:  
Only activate cogging torque compensation with external table for motor data sets (MDS) with the same motor (p5250.0).  
For fault cause = 3:  
Only activate cogging torque compensation with external table for motor data sets (MDS) with the same motor (p5250.0). For the same motor, set p0826 to the same value.  
For fault cause = 4:  
Only activate cogging torque compensation with external table for data sets with the same encoder (p5250.0, p0187).

**207400**      **<location>Drive: DC link voltage maximum controller active**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The DC link voltage controller has been activated because of the upper switch-in threshold (p1244).  
A system deviation can occur between the setpoint and actual speed.  
See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration)

**Remedy:** Not necessary.  
This alarm is automatically withdrawn after the upper threshold has been distinctly exceeded.  
Otherwise, apply the following measures:

- use a Braking Module or regenerative feedback unit.
- increase the ramp-down times (p1121, p1135).
- shut down the Vdc\_max controller (p1240 = 0).

---

**207402 <location>Drive: DC link voltage minimum controller active**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The DC link voltage controller has been activated due to the lower switch-in threshold (p1248).  
A system deviation can occur between the setpoint and actual speed.  
A possible cause can be e.g. that the line supply has failed.  
See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration), p1248 (DC link voltage threshold lower)

**Remedy:** Not necessary.  
This alarm is automatically withdrawn after the lower threshold has been distinctly exceeded.  
Otherwise, apply the following measures:

- check the line supply and infeed.
- increase the ramp-up times (p1120).
- shut down the Vdc\_min controller (p1240 = 0).

---

**207403 <location>Drive: Lower DC link voltage threshold reached**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The DC link voltage monitoring is active (p1240 = 5, 6) and the lower DC link voltage threshold (p1248) was reached in the "Operation" state.

**Remedy:**

- check the line supply voltage.
- check the infeed.
- reduce the lower DC link threshold (p1248).
- switch out (disable) the DC link voltage monitoring (p1240 = 0).

---

**207404 <location>Drive: Upper DC link voltage threshold reached**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The DC link voltage monitoring is active (p1240 = 4, 6) and the upper DC link voltage threshold (p1244) was reached in the "Operation" state.

**Remedy:**

- check the line supply voltage.
- check the infeed unit or the Braking Module.
- increase the upper DC link voltage threshold (p1244).
- if necessary, deactivate the DC link voltage monitoring (p1240 = 0).

| <b>Reaction:</b>      | ENCODER (NONE, OFF2)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Cause:</b>         | <p>An incorrect commutation angle was detected that can result in a positive coupling in the speed controller.</p> <p>Within the pole position identification routine (p1982 = 2):</p> <ul style="list-style-type: none"><li>- a difference of &gt; 45 ° electrical to the encoder angle was determined.</li></ul> <p>For VECTOR, within the encoder adjustment (p1990 = 2):</p> <ul style="list-style-type: none"><li>- a difference of &gt; 6 ° electrical to the encoder angle was determined.</li></ul> |

**Remedy:**

- correctly set the angular commutation offset (p0431).
- re-adjust the motor encoder after the encoder has been replaced.
- replace the defective motor encoder.
- check the pole position identification routine. If the pole position identification routine is not suitable for this motor type, then disable the plausibility check (p1982 = 0).

#### 207414 <location>Drive: Encoder serial number changed

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** ENCODER (NONE, OFF2)

**Acknowledge:** IMMEDIATELY

**Cause:** The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2).

Cause 1:

- the encoder was replaced.

Cause 2:

- a third-party, built-in or linear motor was re-commissioned.

Cause 3:

- the motor with integrated and adjusted encoder was replaced.

Cause 4:

- the firmware was updated to a version that checks the encoder serial number.

Note:

With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).

When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).

Proceed as follows to hide serial number monitoring:

- set the following serial numbers for the corresponding Encoder Data Set: p0441 = FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.

- parameterize F07414 as message type N (p2118, p2119).

**Remedy:** For causes 1, 2:

Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed.

SERVO:

If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated.

or

Set the adjustment via p0431. In this case, the new serial number is automatically accepted.

or

Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

For causes 3, 4:

Accept the new serial number with p0440 = 1.

---

#### 207415 <location>Drive: Angular commutation offset transfer running

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2

**Acknowledge:** NONE

**Cause:** The angular commutation offset was automatically determined using p1990 = 1.

This fault causes the pulses to be suppressed - this is necessary to transfer the angular commutation offset to p0431.

See also: p1990 (Encoder adjustment determine angular commutation offset)

**Remedy:** The fault can be acknowledged without any additional measures.

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**207429 <location>Drive: DSC without encoder not possible**

|                       |                                 |
|-----------------------|---------------------------------|
| <b>Drive object:</b>  | HLA_828, SERVO_828, SERVO_COMBI |
| <b>Message value:</b> | -                               |
| <b>Reaction:</b>      | OFF2                            |
| <b>Acknowledge:</b>   | IMMEDIATELY (POWER ON)          |

**Cause:** The function DSC (Dynamic Servo Control) was activated although there is no encoder.  
See also: p1191 (DSC position controller gain KPC), p1192 (DSC encoder selection)

**Remedy:** Check the encoder selection configuration (p1192).

**Note:**  
If there is no encoder and connector input p1191 (DSC position controller gain) is interconnected, then connector input p1191 must have a 0 signal.

---

**207430 <location>Drive: Changeover to open-loop torque controlled operation not possible**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** For encoderless operation, the converter cannot change over to closed-loop torque-controlled operation (BI: p1501).

**Remedy:** Do not attempt to cover over to closed-loop torque-controlled operation.

---

**207431 <location>Drive: Changeover to encoderless operation not possible**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2 (OFF1)

**Acknowledge:** IMMEDIATELY

**Cause:** For closed-loop torque control, the converter cannot change over to encoderless operation (p1404).

**Remedy:** Do not attempt to change over to encoderless operation.

---

**207432 <location>Drive: Motor without overvoltage protection**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2 (OFF1)

**Acknowledge:** IMMEDIATELY

**Cause:** In the case of a fault at maximum speed, the motor can generate an overvoltage that can destroy the drive system.  
Fault value (r0949, interpret hexadecimal):  
Associated Drive Data Set (DDS).

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remedy:</b> | <p>Overvoltage protection can be implemented in the following ways:</p> <ol style="list-style-type: none"> <li>1. Limit the maximum speed (p1082) without any additional protection.<br/>The maximum speed without protection is calculated as follows:<br/>Rotary synchronous motors: <math>p1082 \text{ [rpm]} \leq 11.695 * r0297/p0316 \text{ [Nm/A]}</math><br/>Linear motors: <math>p1082 \text{ [m/min]} \leq 73.484 * r0297/p0316 \text{ [N/A]}</math><br/>Rotary synchronous motor connected to the high-frequency converter:<br/><math>p1082 \text{ [rpm]} \leq 4.33165E9 * (-p0316 + \sqrt{p0316^2 + 4.86E-9 * (r0297 * r0313)^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]}}) / (r0297 * r0313^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})</math><br/>Linear motor connected to the high-frequency converter:<br/><math>p1082 \text{ [m/min]} \leq 689.403 * p0315 * (\sqrt{p0316^2 * p0315^2 + 0.191865 * r0297^2 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]}}) / (r0297 * (r0377 - p0233) \text{ [mH]} * p0234 \text{ [\mu F]})</math><br/>Rotary induction motor connected to the high-frequency converter:<br/><math>p1082 \text{ [rpm]} \leq \text{maximum} (2.11383E5 / (r0313 * \sqrt{(r0377 \text{ [mH]} + r0382 \text{ [mH]}) * p0234 \text{ [\mu F]}}); 0.6364 * r0297 * p0311 \text{ [rpm]} / p0304)</math></li> <li>2. Use a Voltage Protection Module (VPM) in conjunction with the function "Safe Torque Off" (p9601, p9801 – only for synchronous motors).<br/>When using a synchronous motor with VPM at the high-frequency converter, the following must apply:<br/><math>p1082 \text{ [rpm]} \leq p0348 * (r0377 + p0233) / p0233</math><br/>When a fault condition exists, the VPM short-circuits the motors. During the short-circuit, the pulses must be suppressed - this means that the terminals for the function "Safe Torque Off" (STO) must be connected to the VPM.<br/>When using a VPM, p0643 must be set to 1.</li> <li>3. Activate the internal voltage protection (p1231 = 3, only for synchronous motors).<br/>In so doing, the following hardware preconditions must be fulfilled: <ul style="list-style-type: none"> <li>- the infeed of the group must be capable of energy recovery (Active Line Module, Smart Line Module), and the energy recovery power of the infeed must not be less than the maximum utilized S1 power of the synchronous motor.</li> <li>- For Control Unit and infeed, a 24 V power supply other than that for the Motor Module must be used with the voltage protection activated. The 24 V power supply of this Motor Module must be DC link buffered (e.g. CSM).</li> <li>- a Braking Module with a correspondingly configured braking resistor must be available at the DC link.</li> <li>- the synchronous motor must be short-circuit proof.</li> </ul> </li> </ol> <p>See also: p0643 (Overvoltage protection for synchronous motors), p1231 (Armature short-circuit / DC braking configuration)</p> |

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Cause:** A drive data set was selected - with the pulses enabled - which has a different parameterized direction of rotation (p1821). It is only possible to change the motor direction of rotation using p1821 when the pulses are inhibited.

**Remedy:** - change over the drive data set with the pulses inhibited.  
- ensure that the changeover to a drive data set does not result in the motor direction of rotation being changed (i.e. for these drive data sets, the same value must be in p1821).

**207435 <location>Drive: Setting the ramp-function generator for sensorless vector control**

**Drive object:** HLA\_828

**Message value:** Parameter: %1

**Reaction:** Hla: OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** During operation with sensorless vector control (r1407.1) the ramp-function generator was stopped (p1141) or bypassed (p1122). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen or was not able to be realized.

The drive is switched-on with flying restart activated (p1200), and at the same time the ramp-function generator is bypassed (p1122).

**Remedy:** - deactivate the holding command for the ramp-function generator (p1141).  
- do not bypass the ramp-function generator (p1122).  
- suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6).

**Note:**

For sensorless vector control it is not practical to read in the main setpoint of the speed control via p1155 or p1160 (p0922). In this case, the main setpoint should be injected before the ramp-function generator (p1070). The reason for this is that the ramp-function generator output is automatically set when transitioning from closed-loop speed controlled into open-loop speed controlled operation.

---

**207439 <location>Drive: Function not supported**

**Drive object:** HLA\_828, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** The power unit does not support the selected function.

Fault value (r0949, interpret decimal):

1:

The function "Current controller dynamic response higher" is selected (p1810.11 = 1), however, this is not supported by the power unit (r0192.27 = 0).

- firmware of the booksize power unit is not up-to-date.  
- blocksize power unit was used.

2:

The function "Current controller dynamic response higher" is selected (p1810.11 = 1), however, this is not supported by the safety technology without encoder (9506 = 1, 3).

3:

The function "DC link voltage compensation in the power unit" is selected (p1810.1 = 1), however, this is not supported by the power unit (r0192.28 = 0).

**Remedy:**

For fault value = 1:

- if necessary, upgrade the firmware of the booksize power unit to a later version (version  $\geq 4.4$ ).

Note:

If the firmware has already been automatically upgraded, then only a POWER ON (switch-off/switch-on) is required.

- Use a booksize power unit (version  $\geq 4.4$ ).

For fault value = 2:

- if an encoder with Safety position actual values sensing is available (r0458[0...2].19 = 1), reparameterize the encoderless safety technology (p9506 = 1, 3) to safety technology with encoder (p9506 = 0).

For fault value = 1, 2:

- Deselect the function "Current controller dynamics higher" (p1810.11 = 0) and if required, set the current, speed and position controller again or calculate (p0340 = 4).

For fault value = 3:

- if necessary, upgrade the firmware of the blocksize power unit to a later version (version  $\geq 4.6$ ).
- deselect the "DC link voltage compensation in the power unit" function (p1810.1 = 0).

**207448**      **<location>Load gear: Position tracking, linear axis has exceeded the maximum range**

**Drive object:**    A\_INF\_828, B\_INF\_828, S\_INF\_828, S\_INF\_COMBI

**Message value:**   -

**Reaction:**        Infeed: NONE  
                          Servo: OFF1 (NONE, OFF2, OFF3)  
                          Hla: OFF1 (NONE, OFF2, OFF3)

**Acknowledge:**    IMMEDIATELY

**Cause:**           For a configured linear axis/no modulo axis, the currently effective motor encoder (encoder 1) has exceeded the maximum possible traversing range.

For the configured linear axis, the maximum traversing range is defined to be  $64 \times (+/- 32 \times)$  of p0421. It should be read in p2721 and interpreted as the number of load revolutions.

Note:

Only the motor encoder in the currently effective drive data set is monitored here. The actual effective drive data set is displayed in x = r0051 and the corresponding motor encoder is specified in p0187[x].

**Remedy:**           The fault should be resolved as follows:

- select encoder commissioning (p0010 = 4).
- reset position tracking, position (p2720.2 = 1).
- deselect encoder commissioning (p0010 = 0).

The fault should then be acknowledged and the absolute encoder adjusted.

|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>  | More than one encoder with identical component number is assigned to a single drive data set. In one drive data set, it is not permissible that identical encoders are operated together.<br>Fault value (r0949, interpret decimal):<br>$1000 * \text{first identical encoder} + 100 * \text{second identical encoder} + \text{drive data set}$ .<br>Example:<br>Fault value = 1203 means:<br>In drive data set 3, the first (p0187[3]) and second encoder (p0188[3]) are identical. |
| <b>Remedy:</b> | Assign the drive data set to different encoders.<br>See also: p0141, p0187 (Encoder 1 encoder data set number), p0188 (Encoder 2 encoder data set number), p0189 (Encoder 3 encoder data set number)                                                                                                                                                                                                                                                                                 |

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Cause:</b>         | Using p0141, a changeover of the encoder data set is prepared that is illegal. In this firmware release, an encoder data set changeover is only permitted for the components in the actual topology.<br>Fault value (r0949, interpret decimal):<br>Incorrect EDS data set number.<br>See also: p0187 (Encoder 1 encoder data set number), p0188 (Encoder 2 encoder data set number), p0189 (Encoder 3 encoder data set number) |
| <b>Remedy:</b>        | Every encoder data set must be assigned its own dedicated DRIVE-CLiQ socket. The component numbers of the encoder interfaces (p0141) must have different values within a drive object.<br>The following must apply:<br>p0141[0] not equal to p0141[1] not equal to ... not equal to p0141[n]                                                                                                                                   |

| <b>Reaction:</b>      | OFF2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Cause:</b>         | In at least two drive data sets (DDS), the same motor data set (MDS) is assigned different encoder data sets (EDS) for the motor encoder. In various DDSs, it is not permissible for an MDS to have different motor encoders.<br>The following parameterization therefore results in an error:<br>DDS0: p0186[0] = 0, p0187[0] = 0<br>DDS1: p0186[1] = 0, p0187[1] = 1<br>Fault value (r0949, interpret decimal):<br>The lower 16 bits indicate the first DDS. The upper 16 bits indicate the second DDS. |
| <b>Remedy:</b>        | Create two MDS with the same motor data in order to operate one motor with different motor encoders.<br>Example:<br>DDS0: p0186[0] = 0, p0187[0] = 0<br>DDS1: p0186[1] = 1, p0187[1] = 1                                                                                                                                                                                                                                                                                                                  |

| <b>Acknowledge:</b>   | NONE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Cause:</b>         | Encoderless operation was set as fault response to encoder faults (p0491). However, the encoderless control has not yet been commissioned.<br>Note:<br>In at least one drive data set (DDS) the load moment of inertia is zero (p1498 = 0).<br>See also: p0491 (Motor encoder fault response ENCODER)                                                                                                                                                                                                                                                   |

**Remedy:** Commission the encoderless control.  
Perform the following steps to facilitate a simple setting:

- the speed controller must have already been optimized for operation with encoder (e.g. the optimized P gain is in p1460).
- set the load moment of inertia (p1498, e.g. using function module "Moment of inertia estimator/OBT" or "AST" for SINUMERIK).
- set the current setpoint for open-loop controlled operation without encoder (p1612) for static loads (e.g. vertical axis without weight compensation, preset value plus torque-generating current (r0077) for the base load).
- set the speed controller.

p1470 = optimized p1460/16 for sampling time = 125 µs (P gain)  
p1470 = optimized p1460/25 for sampling time = 62.5 µs (P gain)  
p1470 = optimized p1460/30 for sampling time = 31.25 µs (P gain)  
p1472 = 140 ms (integral time, default value).  
p1451 = 10 ms (speed actual value smoothing encoderless operation).

- set encoderless operation current reduction:  $p0642 = 2 * p0318 / p0640$  (for a result > 100%, 100% should be entered).
- if the motor moment of inertia changes significantly, then the moment of inertia estimator should be activated using function module "Moment of inertia estimator/OBT".
- save the set values in a non-volatile fashion (copy RAM to ROM).
- test the function while moving with p4642 = 1 (encoder fault, test function).

**Note:**  
The following must be set if Safety Extended Functions with encoder in the 1-encoder system are enabled:

- No STOP A after encoder fault for 1-encoder Safety (p9516.4 = 1).
- Transition time STOP F to STOP B is long enough to brake the motor (p9555).

If the result is not satisfactory, then encoderless operation must be manually optimized (e.g. temporarily switch over to encoderless operation using p1300 = 20).  
Information about the moment of inertia estimator and encoderless operation is provided in the following reference:  
SINAMICS S120 Function Manual Drive Functions

**207541 <location>Drive: Data set changeover not possible**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The selected drive data set changeover and the assigned motor changeover are not possible and are not carried out.  
For synchronous motors, the motor contactor may only be switched for actual speeds less than the speed at the start of field weakening (r0063 < p0348).  
See also: r0063, p0348

**Remedy:** Reduce the speed to below the speed at the start of field weakening (r0063 < p0348).

---

**207550 <location>Drive: Not possible to reset encoder parameters**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** When carrying out a factory setting (e.g. using p0970 = 1), it was not possible to reset the encoder parameters. The encoder parameters are directly read out of the encoder via DRIVE-CLiQ.  
Alarm value (r2124, interpret decimal):  
Component number of the encoder involved.

**Remedy:**

- repeat the operation.
- check the DRIVE-CLiQ connection.

**207553 <location>Drive encoder: Sensor Module configuration not supported****Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI**Message value:** Encoder data set: %1, first incorrect bit: %2, incorrect parameter: %3**Reaction:** Infeed: OFF2 (NONE, OFF1)

Servo: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)

Hla: OFF2 (NONE, OFF1, OFF3, STOP2)

**Acknowledge:** IMMEDIATELY (POWER ON)**Cause:** The Sensor Module does not support the requested configuration.

For incorrect p0430 (cc = 0), the following applies:

- in p0430 (requested functions), at least 1 bit was set that is not set in r0458 (supported functions) (exception: Bit 19, 28, 29, 30, 31).

- p1982 &gt; 0 (pole position identification requested), but r0458.16 = 0 (pole position identification not supported).

For incorrect p0437 (cc = 1), the following applies:

- in p0437 (requested functions), at least 1 bit was set that is not set in r0459 (supported functions).

Fault value (r0949, interpret hexadecimal):

ddccbbaa hex

aa: encoder data set number

bb: first incorrect bit

cc: incorrect parameter

cc = 0: incorrect parameter is p0430

cc = 1: incorrect parameter is p0437

cc = 2: incorrect parameter is r0459

cc = 3: incorrect parameter is p0454

dd: reserved (always 0)

**Remedy:** - check the encoder parameterization (p0430, p0437, p0454).

- check the pole position identification routine (p1982).

- use the matching encoder evaluation (r0458, r0459).

**207562 <location>Drive, encoder: Position tracking, incremental encoder not possible**

**Drive object:** A\_INF\_828, B\_INF\_828, HLA\_828, S\_INF\_828, S\_INF\_COMBI, SERVO\_828, SERVO\_COMBI  
**Message value:** Fault cause: %1, component number: %2, encoder data set: %3  
**Reaction:** Infeed: OFF2 (NONE, OFF1)  
Servo: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)  
Hla: OFF2 (NONE, OFF1, OFF3, STOP2)  
**Acknowledge:** IMMEDIATELY (POWER ON)  
**Cause:** The requested position tracking for incremental encoders is not supported.  
Fault value (r0949, interpret hexadecimal):  
ccccbbaa hex  
aa = encoder data set  
bb = component number  
cccc = fault cause  
cccc = 00 hex = 0 dec  
The encoder type does not support the "Position tracking incremental encoder" function.  
cccc = 01 hex = 1 dec  
Position tracking cannot be activated because the memory of the internal NVRAM is not sufficient or a Control Unit does not have an NVRAM.  
cccc = 04 hex = 4 dec  
A linear encoder is used that does not support the "position tracking" function.  
See also: p0404 (Encoder configuration effective), p0411 (Measuring gear configuration), r0456 (Encoder configuration supported)  
**Remedy:** - check the encoder parameterization (p0400, p0404).  
- use a Control Unit with sufficient NVRAM.  
- if required, deselect position tracking for the incremental encoder (p0411.3 = 0).

| <b>Drive object:</b>  | HLA_828                                                                                                               |
| <b>Message value:</b> | -                                                                                                                     |
| <b>Reaction:</b>      | OFF2 (NONE, OFF1, OFF3)                                                                                               |
| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                           |
| <b>Cause:</b>         | A valve with a valve feedback signal was parameterized (p0218.2 = 1), however the valve does not follow the setpoint. |

- Remedy:**
- correct the configuration for the valve without valve feedback signal (p0218.2 = 0).
  - check the valve natural frequency (p0216).
  - for the incorrect sign, invert the valve actual value (p0218.3).
  - check the valve and valve connection.

---

**207752 <location>Drive: Piston position not possible**

**Drive object:** HLA\_828

**Message value:** -

**Reaction:** OFF1 (NONE, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** The piston was calibrated (p0476 not equal to 0) and the absolute position is available (p1407.3 = 1). However, the piston position (r0094) is not plausible (negative or higher than the stroke in p0313).

- Remedy:**
- check position inversion (p0410.1).
  - check direction convention: piston position (r0094) must be zero, if the piston is located at the A side. When moving from the A to the B side, velocity and position increase must be positive.
  - check the piston calibration, and if required, recalibrate the piston with the piston at the A side (p1909.1 = 1).
  - when replacing the encoder, recalibrate the piston.
  - when shifting the machine zero point, recalibrate the piston.

**Note:**

Before acknowledging the fault, set p0476 = 0. Then calibrate the piston again (p1909.1 = 1 with the piston completely retracted or set p1959.2 = 1 and p1960 = 1).

**207753 <location>Drive: No valid pressure actual value available**

**Drive object:** HLA\_828

**Message value:** -

**Reaction:** OFF2 (NONE, OFF1, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:**

- the "force controller", "force limiting" or "stiction compensation" is activated (p1400), and at least one of the two required pressure sensors for pressure actual value A or B is not supplying a valid value. The two pressure actual values A and B are required for the functions listed above.

- the system pressure adaptation function for the speed controller is activated (p1400.15 = 1) and no system pressure measured value (r0069) is available. A system pressure measured value is required for this function.

- Remedy:**
- check pressure sensors and wiring for pressure actual values A and B (X241 or X242).
  - check offset correction values for pressure actual values A and B (p0241, p0243).
  - if required, deselect the function "force controller", "force limiting" or "stiction compensation" (p1400).

- reduce the continuous load.  
- adapt the load duty cycle.

---

**207805 <location>Drive: Power unit overload I2t****Drive object:** SERVO\_828, SERVO\_COMBI**Message value:** -**Reaction:** NONE**Acknowledge:** NONE**Cause:** The alarm threshold for I2t overload (p0294) of the power unit has been exceeded.  
The response parameterized in p0290 becomes active.  
See also: p0290 (Power unit overload response)**Remedy:**  
- reduce the continuous load.  
- adapt the load duty cycle.  
- check the assignment of the rated currents of the motor and Motor Module.

---

**207808 <location>HF Damping Module: damping not ready****Drive object:** HLA\_828, SERVO\_828**Message value:** %1**Reaction:** OFF2 (NONE, OFF1, OFF3)**Acknowledge:** IMMEDIATELY**Cause:** When switching on or in the switched-on state, the HF Damping Module does not return a ready signal.  
Fault value (r0949, interpret hexadecimal):

- 1: Fault at switch-on identified.
- 2: Fault during operation identified.

**Remedy:**  
- check the DRIVE-CLiQ wiring to the HF Damping Module.  
- check the 24 V supply voltage.  
- if required, replace the HF Damping Module.Note:  
HF Damping Module

| <b>Cause:</b>       | <p>The code number of the actual power unit does not match the saved number. This only occurs if the comparator in p9906 or p9908 is not at 2 (low) or 3 (minimum).</p> <p>Fault value (r0949, interpret decimal):</p> <p>Number of the incorrect parameter.</p> <p>See also:r0200 (Power unit code number actual), p0201 (Power unit code number)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Remedy:</b>      | <p>Connect the original power unit and switch on the Control Unit again (POWER ON) or set p0201 to r0200 and exit commissioning with p0010 = 0.</p> <p>For infeeds, the following applies:</p> <p>Line reactors or line filters must be used that are specified for the new power unit. A line supply and DC link identification routine (p3410 = 5) must then be carried out. It is not possible to change the power unit without re-commissioning the system if the type of infeed (A_Infeed, B_Infeed, S_Infeed), the type of construction/design (booksize, chassis) or the voltage class differ between the old and new power units.</p> <p>For inverters, the following applies:</p> <p>If the new power unit is accepted, then if required, the current limit (p0640) can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same).</p> <p>If not only the power unit is changed, but also the motor, then the motor must be re-commissioned (e.g. using p0010 = 1). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ.</p> <p>See also:r0200 (Power unit code number actual)</p> |

| <b>Cause:</b>         | <p>The code number of the actual power unit does not match the saved number. This only occurs if the comparator in p9906 or p9908 is not at 2 (low) or 3 (minimum).</p> <p>Fault value (r0949, interpret decimal):</p> <p>Number of the incorrect parameter.</p> <p>See also:r0200 (Power unit code number actual), p0201 (Power unit code number)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Remedy:</b>        | <p>Connect the original power unit and switch on the Control Unit again (POWER ON) or set p0201 to r0200 and exit commissioning with p0010 = 0.</p> <p>For infeeds, the following applies:</p> <p>Line reactors or line filters must be used that are specified for the new power unit. A line supply and DC link identification routine (p3410 = 5) must then be carried out. It is not possible to change the power unit without re-commissioning the system if the type of infeed (A_Infeed, B_Infeed, S_Infeed), the type of construction/design (booksize, chassis) or the voltage class differ between the old and new power units.</p> <p>For inverters, the following applies:</p> <p>If the new power unit is accepted, then if required, the current limit (p0640) can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same).</p> <p>If not only the power unit is changed, but also the motor, then the motor must be re-commissioned (e.g. using p0010 = 1). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ.</p> <p>If the comparison stage in p9906 is set to 2, 3, then commissioning can be exited (p0010 = 0) and the fault acknowledged.</p> <p>See also:r0200 (Power unit code number actual)</p> |

| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Cause:</b>         | <p>The signal "infeed operation" was withdrawn in operation.</p> <ul style="list-style-type: none"> <li>- interconnection of the binector input for the signal "infeed operation" is either incorrect or missing (p0864).</li> <li>- the enable signals of the infeed were disabled.</li> <li>- due to a fault, the infeed withdraws the signal "infeed operation".</li> </ul> |

**Remedy:**

- check the interconnection of the binector input for the "infeed operation" signal (p0864).
- check the enable signals of the infeed and if required, enable.
- remove and acknowledge an infeed fault.

**Note:**

If this drive is intended to back up the DC link regeneratively, then the fault response must be parameterized for NONE, OFF1 or OFF3. so that the drive can continue to operate even after the infeed fails.

|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remedy:</b> | <p>For closed-loop speed and torque control with speed encoder, the following applies:</p> <ul style="list-style-type: none"> <li>- check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft).</li> <li>- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover.</li> </ul> <p>If there is no fault, then the fault tolerance (p1744 and p0492) can be increased.</p> <p>For closed-loop speed and torque control without speed encoder, the following applies:</p> <ul style="list-style-type: none"> <li>- check whether the drive in the open-loop controlled mode (r1750.0) stalls under load. If yes, then increase the current setpoint using p1610.</li> <li>- check whether the drive stalls due to the load if the speed setpoint is still zero. If yes, then increase the current setpoint using p1610.</li> <li>- if the motor excitation (magnetizing) time (r0346) was significantly reduced, then it should be increased again.</li> <li>- check the current limits (p0640, r0067). If the current limits are too low, then the drive cannot be magnetized.</li> <li>- check the current controller (p1715, p1717) and the speed adaptation controller (p1764, p1767). If the dynamic response was significantly reduced, then this should be increased again.</li> <li>- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the motor that is controlled for the data set changeover.</li> </ul> <p>If there is no fault, then the fault tolerance (p1745) or the delay time (p2178) can be increased.</p> <p>For separately excited synchronous motors (closed-loop control with speed encoder), the following applies:</p> <ul style="list-style-type: none"> <li>- check the speed signal (interrupted cable, polarity, pulse number).</li> <li>- ensure the correct motor parameterization (rating plate and equivalent circuit diagram parameters).</li> <li>- check the excitation equipment and the interface to the closed-loop control.</li> <li>- encoder the highest possible dynamic response of the closed-loop excitation current control.</li> <li>- check the speed control for any tendency to oscillate and if resonance effects occur, use a bandstop filter.</li> <li>- do not exceed the maximum speed (p2162).</li> </ul> <p>If there is no fault, then the delay time can be increased (p2178).</p> |

| <b>Reaction:</b>      | OFF2 (NONE)                                                                                        |
| <b>Acknowledge:</b>   | IMMEDIATELY                                                                                        |

**Cause:** When closing, the contactor feedback signal (p1235) did not issue the signal "Closed" (r1239.1 = 1) within the monitoring time (p1236).

**Remedy:**

- check that the contactor feedback signal is correctly connected (p1235).
- check the logic of the contactor feedback signal (r1239.1 = 1: "Closed", r1239.1 = 0: "Open").
- increase the monitoring time (p1236).
- if required, set the external armature short-circuit without contactor feedback signal (p1231 = 2).

---

**207906 <location>Armature short-circuit / internal voltage protection: Parameterization error**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Fault cause: %1, motor data set: %2

**Reaction:** OFF2

**Acknowledge:** IMMEDIATELY

**Cause:** The armature short-circuit is incorrectly parameterized.

Fault value (r0949, interpret decimal):

zzzzyyxx: zzzz = fault cause, xx = motor data set

zzzz = 0001 hex = 1 dec:

A permanent-magnet synchronous motor has not been selected.

zzzz = 0002 hex = 2 dec:

No induction motor selected.

zzzz = 0065 hex = 101 dec:

External armature short-circuit: Output (r1239.0) not wired.

zzzz = 0066 hex = 102 dec:

External armature short-circuit with contactor feedback signal: No feedback signal connected (BI:p1235). The feedback signal must be interconnected in all command data sets (CDS).

zzzz = 0067 hex = 103 dec:

External armature short-circuit without contactor feedback signal: Wait time when opening (p1237) is 0.

zzzz = 00C9 hex = 201 dec:

Internal voltage protection: The maximum output current of the Motor Module (r0209) is less than 1.8 x motor short-circuit current (r0331).

zzzz = 00CA hex = 202 dec:

Internal voltage protection: A Motor Module in booksize or chassis format is not being used.

zzzz = 00CB hex = 203 dec:

Internal voltage protection: The motor short-circuit current (p0320) is greater than the maximum motor current (p0323).

zzzz = 00CC hex = 204 dec:

Internal voltage protection: The activation (p1231 = 4) is not given for all motor data sets with synchronous motors (p0300 = 2xx, 4xx).

| <b>207908</b>        | <b>&lt;location&gt;Internal armature short-circuit active</b> |
| <b>Drive object:</b> | SERVO_828, SERVO_COMBI                                        |

**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** The Motor Module signals that the motor is short-circuited through the power semiconductors (r1239.5 = 1). The pulses cannot be enabled. The internal armature short-circuit is selected (p1231 = 4):  
**Remedy:** For synchronous motors, the armature short-circuit braking is activated with binector input p1230 = 1 signal.  
See also: p1230 (Armature short-circuit / DC braking activation), p1231 (Armature short-circuit / DC braking configuration)

**207909 <location>Internal voltage protection: Deactivation only effective after POWER ON**

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** NONE  
**Acknowledge:** POWER ON  
**Cause:** The deactivation of the internal voltage protection (p1231 not equal to 3) only becomes effective after POWER ON.  
The status signal r1239.6 = 1 indicates that the internal voltage protection is ready.  
**Remedy:** Not necessary.  
This a note for the user.

---

**207910 <location>Drive: Motor overtemperature**

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** %1  
**Reaction:** NONE  
**Acknowledge:** NONE  
**Cause:** KTY84/PT1000:  
The motor temperature has exceeded the alarm threshold (p0604, p0616).  
PTC:  
The response threshold of 1650 Ohm was exceeded.  
Alarm value (r2124, interpret decimal):  
this is the number of the temperature channel leading to the message.  
See also: p0604, p0612, p0617, p0618, p0619, p0625, p0626, p0627, p0628  
**Remedy:**

- check the motor load.
- check the motor ambient temperature and cooling.
- check PTC or bimetallic NC contact.
- check the monitoring limits (p0604, p0605).
- activate/check the parameters of the motor temperature model (p0612, p0626 and following).

**207913 <location>Excitation current outside the tolerance range**

**Drive object:** SERVO\_828, SERVO\_COMBI  
**Message value:** -  
**Reaction:** OFF2  
**Acknowledge:** IMMEDIATELY  
**Cause:** The difference between the excitation current actual value and setpoint has exceeded the tolerance:  
 $\text{abs}(r1641 - r1626) > p3201 + p3202$   
The cause of this fault is again reset for  $\text{abs}(r1641 - r1626) < p3201$ .  
**Remedy:**

- check the parameterization (p1640, p3201, p3202).
- check the interfaces to the excitation equipment (r1626, p1640).
- check the excitation equipment.

| <b>Cause:</b>  | The Motor Module signals that the motor is short-circuited through the power semiconductors (r1239.5 = 1). The pulses cannot be enabled. The internal voltage protection is selected (p1231 = 3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Remedy:</b> | <p>If the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1), then the Motor Module automatically decides - using the DC link voltage - as to whether the armature short-circuit should be activated. The armature short-circuit is activated and response OFF2 is initiated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the armature short-circuit is withdrawn.</p> <p>If the motor is still in a critical speed range, the armature short-circuit is re-activated once the DC link voltage exceeds the threshold of 800 V.</p> <p>If the autonomous (independent) internal voltage protection is active (r1239.5 = 1) and the line supply returns (450 V &lt; DC link voltage &lt; 800 V), the armature short-circuit is withdrawn after 3 minutes.</p> |

| <b>Cause:</b>         | <p>The Control Unit has detected a brake control error.</p> <ul style="list-style-type: none"><li>- motor cable is not shielded correctly.</li><li>- defect in the brake control circuit of the Motor Module.</li></ul> <p>Fault value (r0949, interpret decimal):</p> <p>10, 11:</p> <p>Fault in "open holding brake" operation.</p> <ul style="list-style-type: none"><li>- no brake connected or wire breakage (check whether brake opens for p1278 = 1).</li><li>- ground fault in brake cable.</li><li>- S120M: brake opened via terminal X4.1 for mounting purposes (this is only permissible when the power supply voltage is switched off).</li></ul> <p>20:</p> <p>Fault in "brake open" state.</p> <ul style="list-style-type: none"><li>- short-circuit in brake winding.</li></ul> <p>30, 31:</p> <p>Fault in "close holding brake" operation.</p> <ul style="list-style-type: none"><li>- no brake connected or wire breakage (check whether brake opens for p1278 = 1).</li><li>- short-circuit in brake winding.</li></ul> <p>40:</p> <p>Fault in "brake closed" state.</p> <p>50:</p> <p>Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control diagnostics).</p> <p>80:</p> <p>When using the Safe Brake Adapter (SBA), a fault has occurred in the brake control of the Control Unit.</p> <p>See also: p1278 (Brake control diagnostics evaluation)</p> |

**Remedy:**

- check the motor holding brake connection.
- for a parallel connection, check the setting of the power unit data set to control the holding brake (p7015).
- check the function of the motor holding brake.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
- check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).
- replace the Motor Module involved.

Operation with Safe Brake Module:

- check the Safe Brake Module connection.
- replace the Safe Brake Module.

Operation with Safe Brake Adapter (SBA):

- check the SBA connection and if required, replace the SBA.

### 207931 <location>Brake does not open

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** This alarm is output for r1229.4 = 1.

See also: p1216 (Motor holding brake opening time), r1229 (Motor holding brake status word)

**Remedy:**

- check the functionality of the motor holding brake.
- check the feedback signal (p1223).

---

### 207932 <location>Brake does not close

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** This alarm is output for r1229.5 = 1.

For r1229.5 = 1, OFF1/OFF3 are suppressed to prevent the drive accelerating by a load that drives the motor - whereby OFF2 remains effective.

See also: p1217 (Motor holding brake closing time), r1229 (Motor holding brake status word)

**Remedy:**

- check the functionality of the motor holding brake.
- check the feedback signal (p1222).

---

### 207934 <location>Drive: S120 Combi motor holding brake configuration

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE (OFF1, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY (POWER ON)

|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cause:</b>  | <p>A connected motor holding brake has been detected with an S120 Combi. However, this brake has not been assigned to just one Combi feed drive and, therefore, brake control is not configured (correctly).</p> <p>Fault value (r0949, interpret decimal):</p> <p>0: No motor holding brake is assigned (p1215 = 0 or 3 on all S120 Combi feed drives).</p> <p>1: More than one motor holding brake has been assigned (p1215 = 1 or 2 on more than one S120 Combi feed drive) - or there is more than one DRIVE-CLiQ motor with motor holding brake.</p> <p>2: Brake was accidentally assigned to the spindle (p1215 = 1); this is not permitted for this software release.</p> <p>3: An attempt was made to enable the function "Safe Brake Control" (SBC, p9602 = p9802 = 1) for the spindle. This is not permitted for this software release.</p> |
| <b>Remedy:</b> | <p>Check whether the motor holding brake has been assigned to one S120 Combi feed drive exclusively (p1215 = 1 or 2).</p> <p>The fault will only be withdrawn once the motor holding brake has been assigned to just one of the S120 Combi feed drives (p1215 = 1 or 2 for this one drive). From this point, the motor holding brake will be controlled by this drive.</p> <p>See also: p1215 (Motor holding brake configuration)</p>                                                                                                                                                                                                                                                                                                                                                                                                                 |

---

**207935 <location>Drive: Incorrect motor holding brake configuration**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE (OFF1, OFF2, OFF3)

**Acknowledge:** IMMEDIATELY

**Cause:** An incorrect motor holding brake configuration was detected.

Fault value (r0949, interpret decimal):

0:

A motor holding brake was detected where the brake control has not been configured (p1215 = 0).

The brake control configuration was set to "motor holding brake the same as sequence control" (p1215 = 1) (only when commissioning for the first time).

For a chassis unit with Safe Brake Adapter (SBA), the interconnection p9621 = r9872.3 was established (only when commissioning for the first time).

For a parallel connection, the power unit was set in p7015, to which the motor holding brake is connected (only when commissioning for the first time).

1:

A motor holding brake was detected where the brake control has not been configured (p1215 = 0).

The brake control configuration was left at "No motor holding brake available" (p1215 = 0).

11:

The identification had detected more than one motor holding brake for a parallel connection.

12:

For the parallel connection, in p0121 there is no valid component number for the power unit data set that is set in p7015.

13:

With the "Safe Brake Control" (SBC) function activated, an attempt was made to change the value in p7015.

14:

For a parallel connection, the power units set in p7015 cannot be addressed.

**Remedy:**

- For fault value = 0:
  - no remedy required.
- For fault value = 1:
  - if required change the motor holding brake configuration (p1215 = 1, 2).
  - if this fault value unexpectedly occurs, then the motor connections should be checked in order to rule out that they have been interchanged.
- For fault value = 11:
  - For a parallel connection, only connect one motor holding brake.
- For fault value = 12:
  - Check the setting of the power unit data set for a parallel connection (p7015).
- For fault value = 13:
  - Before changing p7015, deactivate the "Safe Brake Control" function (SBC) (p9602).
- For fault value = 14:
  - Check whether the power unit supports the brake control for a parallel connection (r9771.14).
  - Check whether there is a DRIVE-CLiQ communication error between the Control Unit and the power unit involved and, if required, carry out a diagnostics routine for the faults identified.
  - See also: p1215 (Motor holding brake configuration)

---

## 207950 <location>Drive: Incorrect motor parameter

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Parameter: %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:**

- the motor parameters were incorrectly entered while commissioning (e.g. p0300 = 0, no motor)
- the braking resistor has still not been parameterized - commissioning cannot be completed.

Fault value (r0949, interpret decimal):

Parameter number involved.

300 (CU250S-2):

For this control mode, the motor type is not supported.

307:

The following motor parameters could be incorrect:

p0304, p0305, p0307, p0308, p0309

See also: p0300, p0301, p0304, p0305, p0307, p0310, p0311, p0314, p0315, p0316, p0320, p0322, p0323

**Remedy:** Compare the motor data with the rating plate data and if required, correct.

For fault value = 300 (CU250S-2):

Operate a motor type supported by the selected control mode.

---

## 207955 <location>Drive: Motor has been changed

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Parameter: %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The code number of the actual motor with DRIVE-CLiQ does not match the saved number. The code numbers of the bearings, gearbox or brake do not match the saved numbers.

Fault value (r0949, interpret decimal):

Number of the incorrect parameter

See also: p0301 (Motor code number selection), r0302 (Motor code number of motor with DRIVE-CLiQ)

**Remedy:** Connect the original motor, switch on the Control Unit again (POWER ON) and exit quick commissioning with p0010 = 0.  
Or: set p0300 = 10100, without recommissioning (only if the motor data have not changed)  
Or: set p0300 = 10000 (load the parameters from the motor with DRIVE-CLiQ) and re-commission. The data for bearings, gearbox and brake are reloaded.  
Quick commissioning (p0010 = 1) is automatically exited with p3900 > 0.  
If quick commissioning was exited with p0010 = 0, then an automatic controller calculation (p0340 = 1) is not carried out.

---

**207956 <location>Drive: Motor code does not match the list (catalog) motor**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** %1

**Reaction:** NONE

**Acknowledge:** IMMEDIATELY

**Cause:** The motor code of the connected motor with DRIVE-CLiQ does not match the possible list motor types (see selection in p0300).

The connected motor with DRIVE-CLiQ might not be supported by this firmware version.

Fault value (r0949, interpret decimal):

Motor code of the connected motor with DRIVE-CLiQ.

Note:

The first three digits of the motor code generally correspond to the list motor type.

**Remedy:** Use a motor with DRIVE-CLiQ and the matching motor code.

---

**207960 <location>Drive: Incorrect friction characteristic**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Parameter: %1

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The friction characteristic is incorrect.

Alarm value (r2124, interpret decimal):

1:

Incorrect parameter format.

1538:

The friction torque is greater than the maximum from the upper effective torque limit (p1538) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value.

1539:

The friction torque is less than the minimum from the lower effective torque limit (p1539) and zero. This is the reason that the output of the friction characteristic (r3841) is limited to this value.

3820 ... 3829:

Incorrect parameter number. The speeds entered in the parameters for the friction characteristic do not correspond to the following condition:

$0.0 < p3820 < p3821 < \dots < p3829 \leq p0322$  or  $p1082$ , if  $p0322 = 0$

Therefore the output of the friction characteristic (r3841) is set to zero.

3830 ... 3839:

Incorrect parameter number. The torques entered in the parameters for the friction characteristic do not correspond to the following condition:

$0 \leq p3830, p3831 \dots p3839 \leq p0333$

Therefore the output of the friction characteristic (r3841) is set to zero.

See also: r3840 (Friction characteristic status word)

**Remedy:** Fulfill the conditions for the friction characteristic.  
 For alarm value = 1538:  
 Check the upper effective torque limit (e.g. in the field weakening range).  
 For alarm value = 1539:  
 Check the lower effective torque limit (e.g. in the field weakening range).  
 For alarm value = 3820 ... 3839:  
 Fulfill the conditions to set the parameters of the friction characteristic.  
 If the motor data (e.g. the maximum speed p0322) are changed during commissioning (p0010 = 1, 3), then the technological limits and threshold values, dependent on this, must be re-calculated by selecting p0340= 5.

---

#### 207961 <location>Drive: Record friction characteristic activated

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The automatic friction characteristic record is activated.  
 The friction characteristic is recorded at the next switch-on command.  
 When plotting the friction characteristic, it is not possible to save the parameters (p0971, p0977).

**Remedy:** Not necessary.  
 The alarm is automatically withdrawn after the friction characteristic recording has been successfully completed or recording has been deactivated (p3845 = 0).

---

#### 207963 <location>Drive: Record friction characteristic canceled

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** Parameter: %1

**Reaction:** OFF1

**Acknowledge:** IMMEDIATELY

**Cause:** The conditions to record the friction characteristic are not fulfilled.  
 Fault value (r0949, interpret decimal):  
 0046: Missing enable signals (r0046).  
 1082: The highest speed value to be approached (p3829) is greater than the maximum speed (p1082).  
 1084: The highest speed value to be approached (p3829) is greater than the maximum speed (r1084, p1083, p1085).  
 1087: The highest speed value to be approached (p3829) is greater than the maximum speed (r1087, p1086, p1088).  
 1110: Friction characteristic record, negative direction selected (p3845) and negative direction inhibited (p1110).  
 1111: Friction characteristic record, positive direction selected (p3845) and positive direction inhibited (p1111).  
 1198: Friction characteristic record selected (p3845 > 0) and negative (p1110) and positive directions (p1111) inhibited (r1198).  
 1300: The control mode (p1300) has not been set to closed-loop speed control.  
 1755: For encoderless closed-loop control (p1300 = 20), the lowest speed value to be approached (p3820) is less than or equal to the changeover speed, open-loop controlled operation (p1755).  
 1910: Motor data identification activated.  
 1960: Speed controller optimization activated.  
 3820 ... 3829: speed (p382x) cannot be approached.  
 3840: Friction characteristic incorrect.  
 3845: Friction characteristic record deselected.

**Remedy:** Fulfill the conditions to record the friction characteristic.

For fault value = 0046:

- establish missing enable signals.

For fault value = 1082, 1084, 1087:

- Select the highest speed value to be approached (p3829) less than or equal to the maximum speed (p1082, r1084, r1087).
- Re-calculate the speed points along the friction characteristic (p0340 = 5).

For fault value = 1110:

- Select the friction characteristic record, positive direction (p3845).

For fault value = 1111:

- Select the friction characteristic record, negative direction (p3845).

For fault value = 1198:

- Enable the permitted direction (p1110, p1111, r1198).

For fault value = 1300:

- set the control mode (p1300) on the closed-loop speed control (p1300 = 20, 21).

For fault value = 1755:

- For encoderless closed-loop speed control (p1300 = 20) select the lowest speed value to be approached (p3820) greater than the changeover speed of open-loop controlled operation (p1755).
- Re-calculate the speed points along the friction characteristic (p0340 = 5).

For fault value = 1910:

- Exit the motor data identification routine (p1910).

For fault value = 1960:

- Exit the speed controller optimization routine (p1960).

For fault value 3820 ... 3829:

- check the load at speed p382x.
- check the speed signal (r0063) for oscillation at speed p382x. Check the settings of the speed controller if applicable.

For fault value = 3840:

- Make the friction characteristic error-free (p3820 ... p3829, p3830 ... p3839, p3840).

For fault value = 3845:

- Activate the friction characteristic record (p3845).

---

**207965 <location>Drive: Save required**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** NONE

**Acknowledge:** NONE

**Cause:** The angular commutation offset (p0431) was re-defined and has still not been saved.  
In order to permanently accept the new value, it must be saved in a non-volatile fashion (p0971, p0977).  
See also: p0431 (Angular commutation offset), p1990 (Encoder adjustment determine angular commutation offset)

**Remedy:** Not necessary.  
This alarm is automatically withdrawn after the data has been saved.  
See also: p0971 (Save drive object parameters), p0977 (Save all parameters)

---

**207966 <location>Drive: Check the commutation angle**

**Drive object:** SERVO\_828, SERVO\_COMBI

**Message value:** -

**Reaction:** OFF2 (NONE)

**Acknowledge:** IMMEDIATELY

**Cause:** The speed actual value was inverted and the associated angular commutation offset is not equal to zero and is therefore possibly incorrect.

**Remedy:** Angular commutation offset after the actual value inversion or determine it again (p1990=1).

---

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
